Sept. 20. **ADLINGTON, LANCS.**—The Lancashire Education Committee are prepared to receive tenders for the erection of a new elementary school for 352 scholars and a manual instruction and cookery block, at Adlington, near Chorley. Plans may be seen and bills of quantities obtained at the office of the County Architect, Mr. Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2 (which will be returned upon receipt of bona-fide tender). Tenders must be delivered by first post on Monday, Sept. 20th, sealed and endorsed, to "B. Stanton, Esq., High Street, Chorley."—Harcourt E. Clarke, Clerk to the Lancashire County Council, County Offices, Preston.

Sept. 21. **ABBERTON.**—Building a new bridge at Abberton, for the Lexden and Winstree Rural District Council. Plans and specifications can be seen by appointment at the office of John Ennals, Surveyor, Lexden. Tenders, endorsed "Abberton Bridge," to be sent to Chas. H. Tompson, Clerk to the Council, Victoria Chambers, Colchester.

Sept. 21. **BRISTOL.**—Execution of builder's, plumber's, and electrician's work connected with the erection of a Council school at Alexandra Park, Fishponds, for the Bristol Education Committee. Drawings, specifications, and general conditions of contract may be inspected, and on deposit of £2 2s. forms of tender and bills of quantities may be obtained at the office of the Architects, Rodway and Dening, Gaunt House, Orchard Street, Bristol. Tenders to be sent to Wm. Avery Adams, Secretary, Guildhall, Bristol.

Sept. 21. **GREENOCK.**—The School Board invite tenders for (1) digger, mason, and brick works; (2) carpenter, joiner, and ironmongery works; (3) plumber work and gasfittings; (4) slater work; (5) plaster work; (6) glazier work; (7) painter work; (8) furnishings, required in connection with the addition and alteration to Greenock Academy, according to plans by Boston, Menzies and Morton, Architects, Greenock. Schedule of quantities and form of tender can be obtained on application to the undersigned on payment of a deposit of one guinea for each schedule, which amount will be returned on receipt of a bona-fide tender. Sealed tenders on the prescribed form must be delivered to A. F. Niven, Esq., Clerk to the Greenock Burgh School Board, Municipal Buildings, Grenock, not later than 11 o'clock a.m. on Tuesday, 21st September, 1909.

Sept. 21. **DURHAM.**—Erection of new council schools at Wingate and Cold Hesledon; alterations and additions at Dean Bank, New Penshaw, and Westwood Council Schools, for the C.C. Sole tenders are invited. Plans, specifications, and general conditions may be seen, and bills of quantities obtained as follows:—1, for Wingate School (300 scholars), at the office of W. Rushworth, Shire Hall, Durham; 2, for Cold Hesledon School (264 scholars), at the office of J. W. F. Phillipson, Murton Chambers, 8, Grainger Street, Newcastle-on-Tyne; 3, for Dean Bank School, at the office of T. W. T. Richardson, 57, High Street, Stockton-on-Tees; 4, for new Penshaw and Westwood Council Schools (plans, specifications, and general conditions only), at the office of F. E. Coates, Shire Hall, Durham. Tenders are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

Sept. 22. **NEWCASTLE (Co. Down).**—Enlarging and remodelling the Church of Our Lady of the Immaculate Conception, Newcastle, Co. Down, for Rev. James M'Ilvenny, P.P. Copies of the plans and specification can be obtained from J. J. M'Donnell, Architect, 27, Chichester Street, Belfast, to whom sealed and endorsed tenders are to be sent.

Sept. 22. **ILFRACOMBE.**—Erection of business premises, the Promenade, Ilfracombe, for T. D. Harding. Drawings and specifications may be obtained at the office of Allen T. Hussell, F.R.I.B.A., Market Square, Ilfracombe, to whom tenders are to be sent.

Sept. 22. **BLACKPOOL.**—Erection of the new central library and new art gallery, Blackpool, for the Corporation. Names and addresses, together with deposit of £2 2s., to T. Loftos, Town Clerk. Quantities can be obtained on Sept. 8th, on application to the Town Clerk, to whom tenders must be sent.

Sept. 22. **FULHAM.**—Alterations to Wharf, and additions to wharf-keeper's house, at Swan Wharf, Putney Bridge. Particulars from the Borough Engineer and Surveyor, Town Hall, Fulham. Tenders to be delivered by 4 p.m. on Wednesday, September 22, 1909. — J. Percy Shuter, Town Clerk, Town Clerk's Office, Town Hall, Fulham, S.W.

Sept. 22. **ANGLESEY.**—Additions and alterations to the Council School at Bodedern, Anglesey. Plans, etc., may be inspected at the above school. Tenders, sealed and endorsed "Bodedern School Tender," to be sent in to R. H. Williams, Secretary of Education, Education Offices, Llangefni. Forms of tender will be supplied on application to the Schoolmaster, Bodedern.

Sept. 22. **LONDON, S.W.**—Decorations and repairs to the underground convenience at Gibbs Green, West Kensington, and the urinal at Putney Bridge, also carrying out certain alterations to wharf and additions to wharf-keeper's house at Swan Wharf, Putney Bridge, for the Metropolitan Borough of Fulham. Separate forms of tender, specifications, and other particulars for the above works may be obtained on application to the Borough Engineer and Surveyor, Town Hall, Fulham. Tenders must be sent to J. Percy Shuter, Town Clerk, Town Clerk's Office, Town Hall, Fulham, S.W.

Sept. 23. **SWANSEA.**—Erection of an electric power station on the eastern side of the Prince of Wales Dock Lock, for the Swansea Harbour Trustees. Drawings and specification may be seen and form of tender obtained at the office of the trustees' engineer, A. O. Schenk, M.I.C.E., Harbour Offices, Swansea. Tenders should be delivered to Talfourd Strick, Clerk, Harbour Offices, Swansea.

Sept. 23. **MAIDSTONE.**—Erection of an isolation hospital on a site situate adjacent to Well Street in the parish of Loose, near Maidstone, for the R.D.C. Plans and specification and bills of quantities and form of tender at the office of Ruck and Smith, Architects, 86, Week Street, Maidstone, on deposit of £1 1s. Quantities, etc., may be obtained on or after Sept. 13. Tenders on form supplied, to be delivered to Robert Hoar, Clerk, 9, King Street, Maidstone.

Sept. 23. **LEEDS.**—Contractors desirous of tendering for any of the trades required in the erection of boys' and girls' departments at Kirkstall Road Council School, are requested to apply to the Education Department (Architect's Section), Calverley Street, Leeds. Tenders to be delivered not later than 10 a.m. on Thursday, September 23, to the undersigned, endorsed "Tender for Kirkstall Road Council School."—James Graham, Secretary for Education, Education Office, Leeds.

Sept. 23. **TUNBRIDGE WELLS.**—The Commissioners of H.M. Works of Public Buildings are prepared to receive tenders for the extension of the Post Office, Tunbridge Wells. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster. Bills of quantities and forms of tender may be obtained at the undermentioned address on payment of one guinea. The sums so paid will be returned to those persons who send in tenders in conformity with the conditions specified below. Tenders must be delivered before 11 a.m. on Thursday, 23rd September, addressed to The Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Tunbridge Wells Post Office Extension.

(Continued on page xxiii.)

If you are really ambitious to advance rapidly in your work—

or perhaps take up a better paying line—

you surely would not let so slight a matter as the simple marking of a coupon deter you from realising your ambition.
Actually, that is all you have to do to secure complete and detailed information as to how you can speedily become master of your own line, or gain the necessary technical equipment to fit you for a good-paying position in the line of work you aspire to undertake.
The statement that the International Correspondence Schools, Ltd., can positively equip you for a position of power and big value to an employer is not a mere claim but a fact. It is a fact bourne out by the testimony of thousands of successful I.C.S. students. We will send you a few of their letters to banish any doubts you may have as to the practicability of the world-wide I.C.S. training. Just think of becoming master of your chosen line, thoroughly, soundly, technically trained in its every Department—while you sit comfortably in your own home. No classes to attend—no books to buy. The Course covers everything you need. And you are personally instructed, not by theorists but by the foremost, practical, technical experts in each line of work.
Surely you are doing yourself an injustice if you do not at least **enquire** for full information concerning your chosen line. And remember—the I.C.S. Students' Aid Department stands at the back of I.C.S. Students to put them in touch with desirable berths.

139

Registrar, INTERNATIONAL CORRESPONDENCE SCHOOLS, Ltd., (Dept. B.), International Buildings, Kingsway, London, W.C. And at Manchester, Birmingham and Glasgow.

I am interested in your System of Technical Training and desire to increase my earning power. Please send me, post paid free of charge, the Book covering the subject before which I have marked X on the Coupon, and full information showing how I can succeed in same.

L. & C. HARDTMUTH'S
KOH-I-NOOR PENCIL

is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

KOH-I-NOOR
TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process.

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

The Abuse of Credit.

It appears from the official report of a meeting of the York Master Builders' Association, printed in another part of the present issue, that the subject of builders' locked-up capital has been taken into consideration by that body. It would not be surprising to find that this is the beginning of a general movement with the object of mitigating an evil that has been allowed to grow to proportions that without exaggeration may be called monstrous. In calling attention to the subject a fortnight ago, we cited the case of a large firm in the North that had sought relief in the bankruptcy court from the embarrassments arising from dilatoriness in settlement of accounts. Since then another case of colossal magnitude has been reported—that of a London firm of extensive practice and of high repute. In better times, with enterprise more active, and with money circulating more freely, both these firms would have remained silent as to the difficulties with which they have had to contend, and we should have lacked their dramatic demonstration of the extent of the evil. Not that the volume of bad and doubtful debts would have been much smaller; only that, in brisker times, the trader would have been less sensitive to its incidence. For prosperity, especially among the millowners, seems simply to increase the evil. We have lately seen, in the report of a meeting of millowners, some very strong remarks that, while they were addressed to very different interests from those we have in view, shed, nevertheless, a lurid light on the misfortunes of builders. The speaker, representing an organisation of millowners, complained of the recklessness with which, during bursts of activity in the textile industries, outside speculators formed companies that were not wanted, and built mills that were superfluous. Wild-cat schemes of this sort were, he declared, extremely common. The effects on the builder and contractor are only too obvious. The superfluous syndicate cannot pay its own way, and it may prevent the old-established owners from paying theirs. It may either prevent their legitimate extension of buildings, or, what is apparently even worse, may hamper their settlement of the builders' bill when they do extend. But millowners, superfluous or otherwise, are not the only and are perhaps, in the aggregate, not the chief offenders. The builders of churches, chapels, and schools could tell, if they would, some weird and almost incredible stories of the hope deferred (or the cheque delayed) which maketh the heart sick. Nor do municipal authorities (some of which are particularly keen on the "fair wages clause," without troubling themselves overmuch as to where the wages are to come from) invariably set a good example of prompt payment. They who, upon popular compulsion, are so solicitous on behalf of the welfare of labour, take away from it more than they give when by depriving building employers of interest on sunk capital they take away the means of treating labour more generously; and the same observation applies with added force to the professed preachers and teachers of charity, who may possibly be doing much spiritual good by running up buildings and running into everlasting debt with the long-suffering builder, but who at the same time are doing much material harm. Labour must not be sweated. Good; then why sweat the employer, who also is a labourer worthy of his hire? The disease seems to be chronic. Hard times having rendered it acute, now is the opportunity for devising and applying the remedy, and we trust that the Federation will not let the matter rest. The first step seems to us to be a vigorous attempt to create a healthy tone among builders themselves. This is only possible to organisation. Here is a direction in which united strength and wisdom may effect the reform of an intolerable abuse.

Gratification from Grimsby.

Grimsby Town Council is unique. It is pleased with the designs for its town hall. It is reasonable in its attitude towards architects. It is fairly generous in the matter of fees. But it is inflexible in the matter of forfeited deposits, although even in this matter it showed itself to be not entirely destitute of bowels of compassion. At a recent meeting of the Town Council, it was proposed to authorise the Borough Treasurer to pay the following fees in connection with the recent competition. First premium, £250; second premium, £150; third premium, £100; assessor's fee (one-fifth of one per cent. on the estimate of £26,000, and thirty guineas), £83 10s. As competitions go, this was not illiberal. The motion was not carried without amendment. It was decided to recommend the payment of the first and second premiums, but that the payment of the third and the assessor's fee should stand over until the question with regard to the cost of the scheme had been settled. The Borough Treasurer was authorised to return their deposits to the architects who had complied with the conditions; but with respect to those who had not, there was some difference of opinion. One architect who has become swiftly sensitive to the wave of prosperity that is shortly to overwhelm the profession, had sent a letter to the effect that, "owing to a sudden pressure of work, he found he was unable to complete the designs in time," and his deposit was returned; nine others, who, we devoutly trust, are labouring under the same happy hindrance, had not sent in any designs, and apparently were too busy to write a letter asking for their money back. Their deposits are to be retained. Perhaps, in the fortunate circumstances we hope that we are right in conjecturing, they can well afford to lose the money. Sir George Doughty did not wish to take advantage of the rigour of the rules. "Why," he asked, "should a Town Council want sixteen guineas from people of that kind [we freely forgive him this slighting expression, in consideration of his broad humanity], who for some reason or another had not sent in plans?" The Borough Surveyor having pointed out that the scheme sent to each competitor had probably cost seven or eight shillings, another councillor suggested the ingenious compromise of deducting the Council's expenses and returning the remainder. Yet another thought it would be better to share the forfeited deposits among the architects who had "sent in designs and not got a prize." This proposition was received with laughter, the mathematicians on the Council no doubt perceiving that the consolation prize would amount to about 5s. 6d. a head. The Mayor settled the matter by remarking that having made conditions it were best to stick to them, lest peradventure "they may come up against you in other matters." But, alas! it is not yet absolutely certain that the designs for which the

Council have expressed such unstinted admiration will be carried out; for it was suggested that the Council should "take a reasonable time before proceeding;" and, with the changes and chances of this naughty world, and the municipal elections due in November, there is no telling what may happen. But we do hope that Grimsby will get the beautiful town hall it desires and deserves.

The Last Straw for Brickmakers.

As to the Budget proposals we have been inundated with opinions for and against; but as they have dealt with matters that have been for the most part purely hypothetical, we have refrained from giving them prominence. Generally speaking, they are overcharged with political bias, and this is not a political organ. The opinions of builders as well as of other business men) as to the land clauses have been collected by a daily contemporary, and these show that while the majority of the builders who have responded are against the Budget proposals, there are many firms of standing who express themselves strongly in favour of the scheme. Neither side argues the point. Each side contents itself with saying, either that if these proposals are passed, building will be paralysed and unemployment will be worse than ever; or, on the other hand, that the Budget will place industry on a more equitable basis and inaugurate a new era of prosperity. This, in each case, is to indulge in the peradventures of prophecy. The fact that the Budget has been already the cause of deepened depression in the building trade is a serious thing in itself; but it proves nothing except that in this as in all such crises the capitalist is holding his hand until he can see which way the cat jumps, and refuses to operate until he can see more clearly either the best or the worst of it—which, it is pretty safe to say, will be neither so good nor so bad as the respective partisans so glibly and so confidently prognosticate. There is, however, one plain issue about which we feel it to be our bounden duty to speak out with no uncertain voice, and that is the remarkable proposal to tax brick earth as a mineral. There are those who, with a pedantic delight in splitting hairs, seek to cut the ground from Mr. Lloyd George's feet by proving that "the courts of law have never yet held clay to be a mineral." These disputants mean well; but we should be disposed to class them with those ingenious persons who, in a similar effort to beg the question, used to declare that tobacco was a food. To us who are more intimately concerned with the main and vital issue, it would not matter two straws if clay were twenty times a mineral. No matter if it were mineral, animal, or vegetable, or all three, or none of them, we are very certain that it never ought to be taxed. For years past, the brick and tile trades have had a bitter struggle for existence, and the imposition of the smallest tax on their raw material would probably involve most of the smaller yards in absolute ruin. But even supposing this calamity were averted, the tax must operate in restraint of trade. It would increase—inappreciably, we are told, but we take leave to doubt it—the cost of building and the influences in that direction are already sufficiently overwhelming. We feel sure, therefore, that builders will unanimously join us in wishing complete success to Mr. H. Greville Montgomery's able and strenuous opposition, in and out of Parliament, to what are cannot but regard as a singularly ill-timed and ill-advised attempt to put the last straw on the back of an over-burdened industry. The Chancellor and the Government probably realise the unpopularity of the tax. Their difficulty is no doubt of the *non possumus* order. Exemption in one case would raise a demand for concession in others; but we have yet to learn that compromise is a daring novelty in government; and this seems to be an instance in which it could be judiciously and defensibly exercised.

The Snare of Veneration.

We are all, no doubt, very much in sympathy with Goldsmith's Mr. Hardcastle, who loves everything that is old, and with Shakerly Marmion in "The Antiquary," who asks, "what find you better or more honourable than age? Take the pre-eminence of it in everything; in an old friend, in old wine, in an old pedigree." Yet the preference should not be absolutely preferential and exclusive. That is a fault that is as little to be admired as the opposite extreme of the craving for novelty; the one being perhaps a revulsion from the other. There are those who seem to hold that nothing new (especially in buildings) can be good; and this would almost seem to be the attitude of a writer in a church newspaper, who, in noting that Selby Abbey is to be re-opened after the restoration necessitated by the fire that occurred there three years ago, makes the following ingenuous remarks: "It is said that the Abbey has been restored to even more than its former beauty, and now stands as one of the classical architectural treasures of the country. We do not know exactly how a restoration can be better than the original work, but Mr. Oldrid Scott, son of the famous Sir Gilbert, who has been the architect, appears to have been very successful." Why this quibble? There is no real contradiction of terms. We might just as reasonably say that we do not know exactly how a Gothic building can be classical, but it would be a perversion of the author's meaning. Is the writer one of those archæological enthusiasts who would have the very blemishes of a building faithfully copied in the restoration? The mere question should resolve the writer's problem, by reminding him that "the letter killeth"; but to it we would add that, given a modern architect of the competency of Mr. Oldrid Scott, there are doubtless many details in which the old work could be undeniably improved. Surely, if knowledge and skill and refined perception are progressive, the modern architect must have an enormous advantage over his predecessors of centuries ago, in spite of the many countervailing influences; and therefore we are very ready to believe that Selby Abbey, as a matter of craftsmanship and pure æsthetics, is now not only a more durable but a more beautiful building than it was before the fire. That it must long lack the antique historical charm of the old building, and that it can never be regarded as a true creation of this or of any other age, is a different matter; and yet, in spite of prescriptive restrictions, it will bear, we suppose, a twentieth century touch that will render it for future generations an interesting though not a very characteristic relic of these our days.

The date of the third International Congress of School Hygiene has been postponed to August 2nd to 7th, 1910.

R.I.B.A. EXAMINATIONS AND RECENT MODIFICATIONS.—II.

(*Continued from page 129, No. 758.*)

In the first part of this article, published in the issue of this journal for August 18th, we made some general remarks on the modifications recently made in the R.I.B.A. examinations, and treated in detail the questions set in the historical papers of the Intermediate. We now propose to deal briefly with the "Science" subjects of this examination, and then to turn to the Final.

The last three papers of the Intermediate are not, in their relation to this article, so important as the first four, in that they have not been altered or modified in any way; but a few points of interest to the student preparing for the examination may be usefully indicated in discussing the questions set. As before, we refer to the questions by number only (a complete copy of them can be obtained from the secretary, No. 9, Conduit Street, W., for 1s.)

Subject V.—Theoretical Construction: Stresses, etc.

Question 1.—This question is worth notice as emphasising a change which has for some time been taking place—the use of "rational" rather than the "empirical" formulæ which two or three years ago were the only ones required. This method of calculation requires a little more insight into first principles, and the importance given to it is undoubtedly an improvement.

Question 2.—This question can be worked either by the same method as required in question 1, or by the common formula, but it is well to notice that there is evidence of a growing necessity for refinement in calculation in order to satisfy the examiners; candidates should beware of getting into the habit of using stereotyped approximations in the dimensions of their steel work, otherwise the exact fractional dimensions here set might lead to difficulties.

Question 3.—Here again we find that it is no longer sufficient, as it was for many years, to learn by "parrot" methods the outlines of the reciprocal diagrams to a few well-known roof-trusses; one is liable to be asked to calculate the stresses in any simple triangulated structure by this graphic method, and to explain clearly the method employed.

Question 4.—This is an old question in a new form. Reference has frequently in the past been made to the reasons for the squaring of "d" in the ordinary empirical formula for beams of rectangular section—a knowledge of principles as well as of facts must always be regarded as essential.

Question 5.—This is, perhaps, a question involving knowledge of a more advanced character than is usual. One must be able to see how the position of a load may modify the stresses in a column so that part of it, like a loaded beam, may be in tension, while the other part is in compression. There is also another difficulty, viz., practical considerations suggest cast metal for the "column" form, but the stresses involved seem rather to call for wrought steel; much would depend on the size of the structure. In the answer the case for both materials should be argued, showing one's knowledge of their characteristics, as no mere statement of one's choice would satisfy the examiner.

Question 6.—Needs little comment: it is a straightforward question of practical calculation. It involves the inevitable sketch—practical drawing of steel work is one of the essentials for success in both examinations.

Question 7.—This also is a question of simple calculation, involving a knowledge of strength of materials in common use.

Questions 8 and 9.—These are both calculated to show the power of observation and reasoning possessed by the candidate—they are not questions which can be readily learnt from a text-book.

Questions 10 and 11 will present no difficulties to the student who has been conscientiously through his text-books. They differ materially from the last two in this respect, and show the necessity for a wider scope of knowledge than has been required hitherto, and something more than is obtainable in the smaller text-books.

Question 12 needs no comment.

Question 13 is easy for one who understands how the ordinary formula for rectangular beams is built up, and the real meaning of a "constant."

Questions 14 and 15 are both questions of quite the ordinary type—both are easily obtained from any text-book on the subject.

On the whole the paper is not more difficult, perhaps, than usual, if one takes into consideration the unusual choice of questions allowed. The first three were compulsory, of the remaining twelve only four were to be attempted: presumably, as there is no indication of the number of marks allotted for each, they must each carry the same number of marks, though it is difficult to see how this can be so. It seems best to advise prospective candidates only to choose the very simple questions where they are unable to attempt those of a more ambitious nature.

Subject VI.—Descriptive Geometry.

It is difficult to know what advice to give to candidates preparing in this subject. As a general rule the same questions, with very slight modification, appear time after time. An analysis of past papers shows that a knowledge of about ten types of questions is sufficient to ensure success. Text-book geometry is not encouraged, but rather the practical geometry involved in the usual office drawings of roofs and such-like isometrical sketches of details constructive and otherwise, and simple mensuration. The present paper is no exception.

Subject VII.—Elementary Applied Construction: the Nature and Use of Ordinary Building Materials.

Generally, it may be said that the latter part of the subject receives as a rule but scant attention—in this paper the "nature" of building materials is not touched upon in any question, but none the less is would never be safe for a candidate to fail to study this branch of the subject in all usual building materials—but such study should be largely a practical study—the more scientific knowledge is required only of the final candidates. All the questions may be said, in a sense, to involve a knowledge of the use of materials, and most of the common building trades are represented.

Question I. covers a great deal of ground, and principally needs quick freehand sketches—descriptive matter should be very concise.

Questions 2 and 3 are both working detail drawings, and such as any assistant might be required to make in the course of the day's work. Both involve some knowledge of bylaws or Building Act.

Question 4 is of usual type, easily answered from a text-book on elementary construction.

Questions 5 and 6 are of more advanced type, and need some individual thought and treatment. It would be difficult to find an answer in any text-book, but they should present no difficulties to an intelligent student with some power and opportunities of observation.

There was here no choice of questions; every candidate was expected to answer all of them.

FINAL AND SPECIAL EXAMINATION.

We now come to the questions set in the Final examination, and in this case the modification was confined entirely to subject II., the historical papers. The actual comparison of the paper set this year with those of recent years will be dealt with in the order of the subjects.

Subject I.—Design.

The Design subject this year was a very interesting one and gave a good deal of scope to those whose experience was chiefly derived from country domestic work. The tendency was to elaborate the plan into an institution rather than a block of homes, worked upon village lines, as far as possible, which was probably the examiner's intention. This inference is drawn from the fact that a block plan was asked for, probably to indicate the relation of one such house with the others of a group, although for such a purpose the scale asked for was inconveniently large. The dormitories (for about 10 children each, allowing about 40ft. super. for each child), with the necessary offices, were the settling factors of the plan, and the aspect of the principal rooms should have been carefully considered and indicated; the details should have been simple. The chief complaint in the design subject is always want of time, but this should not be felt so acutely if those sitting would practise designing small subjects beforehand, ponder carefully the problem when it is announced some days before the examination, getting up any technicalities that the particular problem may contain, and also suitable detail for the style they mean to adopt, which can in almost all cases be settled beforehand, and which is not likely to be overridden by the conditions. On the other hand, it is almost as great a mistake to have a stereotyped plan in one's mind before the examination, as such a plan is more than likely to be rendered entirely useless by the further particulars given in the examination room, and often becomes more a hindrance than otherwise. It cannot be too often impressed upon those taking the examination that this is the most vital subject of all, and that success is hardly possible without a good deal of experience in planning; the same remark applies to the sketch perspective required. Although only a sketch, it should indicate a familiarity with the science of perspective, and this cannot be attained by merely setting up one or two perspectives previous to taking the examination. A certain proportion of candidates seem inclined to omit it altogether, but this is a mistake, as no opportunity of making marks should be lost.

Subject II.—The Principles of Architecture: their Theory and Application.

The nature of the first part of the subject came as rather a surprise probably to the majority, as it contained no question of a definitely historical nature, although all the questions involved a knowledge of principles that must of course be based upon precedent, and which must thus involve a sound general knowledge of the architectural styles as exemplified in the more important buildings in those styles. As in the Intermediate, so in the Final, the examiners are endeavouring to encourage the critical faculty, to emphasise the fact to which Mr. Blomfield calls attention in his new book, "The Mistress Art," viz., that "It is more profitable, even if much more difficult, to search out the message that each generation has to offer in its turn, even though the language is strange and its accent seems unmusical," or again, "study, with a mind alert for all suggestions that may bear on modern practice, and with a keen sense for those underlying strains of thought and feeling by which they attach themselves to the art that went before and to that which followed." Indeed, this book should be read by all intending candidates, as well as Mr. Belcher's "Essentials in Architecture."

Dealing with the paper question by question, we find that the candidates were required to answer only three out of the five questions, a very fair and, as we venture to think, wise precedent. The first question as to the architectural reason for the flêche as at Amiens, was probably the one that appealed most to the men whose studies had been mostly confined to Gothic work. The value of the feature was constructionally to avoid the awkward junction of the nave and transept roofs and aesthetically to give "unity" to the whole composition by a central verti-

CHARLTON ABBOTS.
Aug 1909.

FROM A SKETCH BY C. WONTNER SMITH, A.R.I.B.A.

Charlton Abbots Manor House is a stone building of typical Gloucestershire design of the seventeenth century, built on the side of a steep hill out of which it seems to grow. The sketch was taken during the recent excursion of the Architectural Association to Cheltenham and district, and is reproduced by permission from the "Architectural Association Journal."

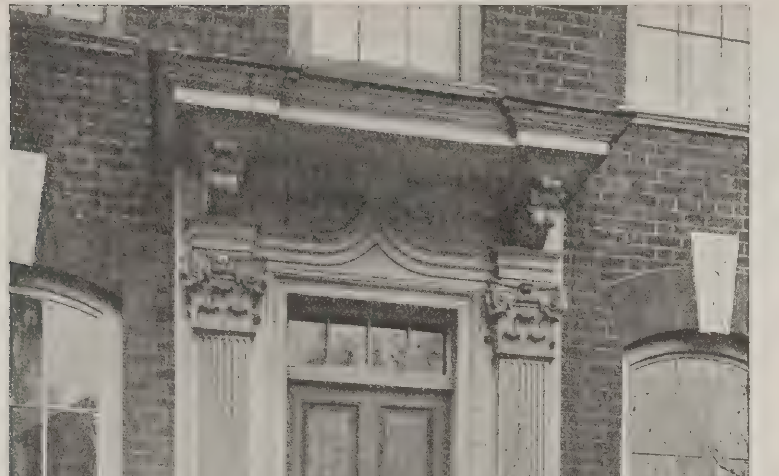

Photo · *F. R. Taylor.*

FRONT DOORWAY, NO. 4, CHEYNE WALK, CHELSEA

No. 4 possesses the most beautiful of all the doorways in Cheyne Walk. It consists of an elaborate hood with carved brackets which overshadow two fine Corinthian pilasters with boldly traced foliage.

(*Reproduced, by permission, from* " *The Survey of London—Chelsea.*")

cal "rallying" point, just as was so often done in England by the central tower as at Chichester, Worcester, Gloucester, and many other cathedral churches. Such a feature is practically necessitated on a cruciform plan, and the need is supplied by the domes of such buildings as the Pantheon, Paris, and St. Paul's, London. It must, however, only be used where the "motif" is unity or verticality, rather than continuity or horizontality; for instance, one can imagine a flêche upon such a building as the Banquetting Hall, Whitehall, or, more unholy thought still, upon the Parthenon, as striking an utterly false note and throwing the whole design out of harmony, and destroying the repose of these buildings.

Mr. Belcher, in his book already mentioned, cites the Temple of Neptune at Paestum, the Gran' Guardia Vecchia at Verona, and the interior of the Accademia delle Bell' Arti, Florence, as being examples of the quality of Repose in Buildings, and perhaps the river front of our own Somerset House might well be given. It will be seen by these examples that the quality is obtained by strong horizontal lines, especially as regards skyline, and a continuity gained by the repetition of any vertical features, and internally by broad simple treatments with an entire absence of "fussy," "busy" detail.

Dealing with the third question one might say that the quality of strength is generally expressed architecturally by general pyramidal form, by battering of the lower storey or abutments, by massing of supports, especially in the lower portions of the design, by largeness and heaviness of material emphasised by rustication, channelling, heavy keystones, etc. Old Newgate and the Riccardi Palace are those most often cited; the west front of St. Mary Woolnoth also expresses a good deal of strength.

The fourth question is a somewhat strange one; we have been unable to find any "well-known" example of a stone ashlar faced building with brick dressings. Certainly such a use of materials would be indefensible under ordinary circumstances, since it would be the binding in of the stronger and larger by the weaker and smaller materials. If the term ashlar-faced had not been used, the brick-quoined flint-built buildings of East Anglia might have been given, but in these the use is justified by the absence of the objection just quoted.

In the last question we should say that scale is given by ashlar as compared with thin coursed rubble. Ashlar work also gives a lighter tone to building, and, generally speaking, a broader, more restful, and more dignified expression. Ashlar would therefore be used where these qualities were desirable. Where the scale of the building is small, as in most Gothic work, the smaller material would be more suitable, but it depends very much upon the feeling of the design, and should have been illustrated by a sketch, showing at a glance the character of the design suggested for the use of each material.

The subject of the afternoon's essay, viz., "A brief historical and descriptive thesis of the constructive and decorative principles governing the orders as used in the great Classic and Renaissance buildings," was a very fair one; every candidate should have made a good show. The tendency was to describe the individual building rather than the principles illustrated thereby. The orderly manipulation of the various divisions of the subject would be sure to gain many marks, and should be carefully guarded by the preparation of an outline before starting to write the thesis proper. For instance, the subject would naturally divide itself into the Greek, Roman, Early (or constructional) and Late (or pedantic) use of the Orders, and each sub-division would then be treated from the constructional first, and then from the decorative point of view.

It will be seen from the above notes that the need for historical knowledge is by no means reduced by the modifications. In answering the above papers many sketches of and reference to historical buildings were necessary, but they are to be studied as a whole, and the course of development and its causes must be studied in a far broader way than can be done from the, until recently, accepted text-books, or than was necessary when disjointed details were asked from certain well-defined buildings of a particular style. It only emphasises the need either for attending the recognised schools, which are all now in touch with this more hopeful training of the architects of the future, or of at least following the reports of lectures and papers given thereat, and of being generally familiar with the most modern thoughts upon the subject.

We have thought it advisable to dwell somewhat fully on the "Art" side of the Final, as it is in this part only that the modification has been made. Upon the remaining subjects we propose only to give a few notes of advice as to the best methods of preparation.

For Subject III.—the Nature and Properties of Building Materials—we should say that a careful study and analysis of the usual text-books, coupled with the ever-important observation of practical work, could hardly fail to ensure success. Failure is principally due to the lack of knowledge how to read for an examination. The purpose of such reading must always be kept in view, and annotation is the keynote of success. In a secondary sense it is important to keep an eye on modern inventions and improvements, and not to despise "catalogues." Natural materials can generally be studied in the larger towns at geological museums; and it is well worth while to spend a few hours in this way.

Subject IV.—The Arrangement and Construction of Buildings in Relation to Health.

In this subject, as is usually the case, the chief question was a system of drainage in plan and detail. This would present no difficulties to the majority, but it nevertheless offers opportunities of economy in design and for the display of a knowledge of modern appliances.

The two compulsory questions dealt with this subject, and of the remaining eight only three were to be attempted, and it is therefore hard to see how any candidates who had prepared for the examination could fail, but the fact is generally fairly clear that failure is often due, not to the lack of knowledge, but to lack of practice in putting it on paper in a manner satisfactory to an examiner.

All the remaining questions were fairly calculated to bring out a knowledge which should be regarded as essential to any architect, and, as is usually the case in this subject, they mostly deal with practical requirements rather than with principles.

(*To be continued.*)

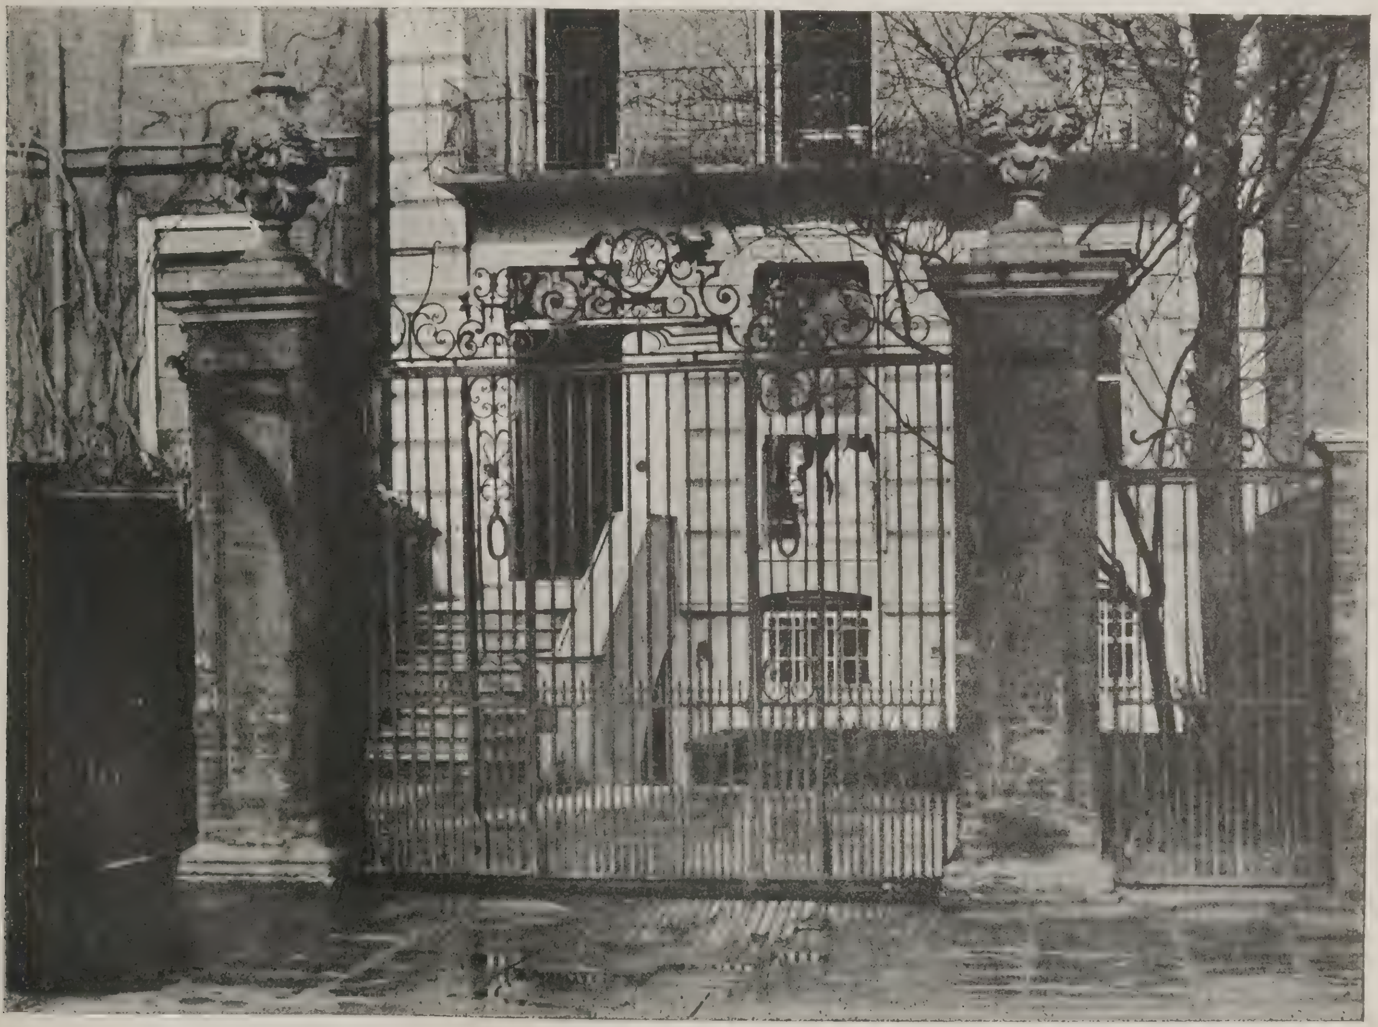
CHARMING CHELSEA.[*]

In spite of its glooms and grime, and of its many mean streets and sordid suggestions, Chelsea, on the whole, is a charming place. Its baser elements serve but as a foil to the quaintness and the beauty that have survived the many vicissitudes to which in latter days the parish has been subjected. It is not for nothing that Chelsea has been and still is a chosen abode of authors, artists, and other persons of refined taste. "To live here, as the writer has done, not far from the Old Church and the river, is to understand how strong its hold can still be upon the affections—it is borne in upon one, intimately and irresistibly. The story of its illustrious men and women may kindle the imagination, but it is its atmosphere—the subtle effect of its history—that will be felt most. Chelsea is responsive to one's moods; it is a place where one cannot remain long a stranger, for it takes one into its confidence, as do all places which have been the scene of centuries of human effort, tempered by just such a quiet unchanging influence as that of the broad river which flows still, as it used to flow, by the time-worn village street. It is this atmosphere that makes Chelsea what it is, in spite of the loss of its ancient palaces, its low river-wall, its river stairs, boats, and summer-houses, and many of its most beautiful rows of humbler homes."

It is in this sympathetic spirit that Mr. Walter H. Godfrey has approached his onerous but enviable task of making the survey of Chelsea, and, with the help of active members of the Committee of the Memorials of Greater London, of which he is so distinguished a member, he has produced a really fascinating book, which, as a record that must necessarily endure long after the objects it describes have ceased to exist, will be of immense service to many a future historian. That Mr. Godfrey should have described and appreciated with the acumen of a trained architect the external and internal features of notable buildings and their adjuncts is only what would have been expected; but that he should have searched the archives with the perseverance and erudition of a seasoned antiquarian would be little short of astonishing if one were not aware that the combination of these qualifications is, after all, happily not rare, although it is but seldom found of such intensity in both kinds.

The book contains eighty-seven pages of the crude spirit of history, in which the essential data are massed together without the addition of an unessential phrase, and yet have been somehow rendered quite readable. There are ninety-four plates, mostly from photographs of varying degrees of merit, but including a few measured drawings that are without exception excellent; and there are, besides, eleven illustrations in the text, and twenty-one heraldic engravings. Mr. Godfrey has himself contributed several of the drawings, as well as the folding map that forms the preface. The pictures are of almost exclusively architectural interest, not excepting the several interesting specimens of old lead work, and the handsome ironwork gates and grilles. As Mr. Godfrey states in his preface, the buildings are in the main of eighteenth century date, or a few years older, and they owe their existence chiefly to two events in Chelsea history: the one, the completion of the Royal Hospital in 1691, whence sprang Paradise Row; and the other, the purchase of the Manor by Sir Hans Sloane, which gave us the charming houses in Cheyne Walk.

Of the three illustrations which we are permitted to reproduce, that showing the gates at No. 5, Cheyne Walk, is associated with some rather curious speculations as to the origin of the gates. "These gates," says Mr. Godfrey, "are somewhat of a puzzle, for at first sight their size and importance seem incongruous when compared with the modest dimensions of the building. The three gates occupy the full length of the frontage, that in the centre being divided from the two smaller ones by fine brick piers surmounted by a good stone cornice and vases of quite exceptional excellence. The piers seem to have been designed for large double gates; they are 11ft. apart, and would take two gates each 4ft. wide, as well as the wrought-iron panels or pilasters. The pilasters are here placed on each side of the single gate, and the rest of the space is made out with plain railings. The wrought-iron scroll-work which crowns the gate and railings includes two charming lamp-stands and a monogram of interlacing initials. The two smaller gates have each some simple scroll-work upon the bar under which they open. The first doubt that naturally arises in the mind—as to the reason for a large centre gate and two small ones in front of so confined a forecourt which gives access to a house whose entrance door is not central but placed at the extreme left—is partly dispelled by Mr. William Ascroft, who has made the following note: 'The doors were originally in the centre, opening into a large hall, now the dining-room. The approach was by a wide flight of steps with

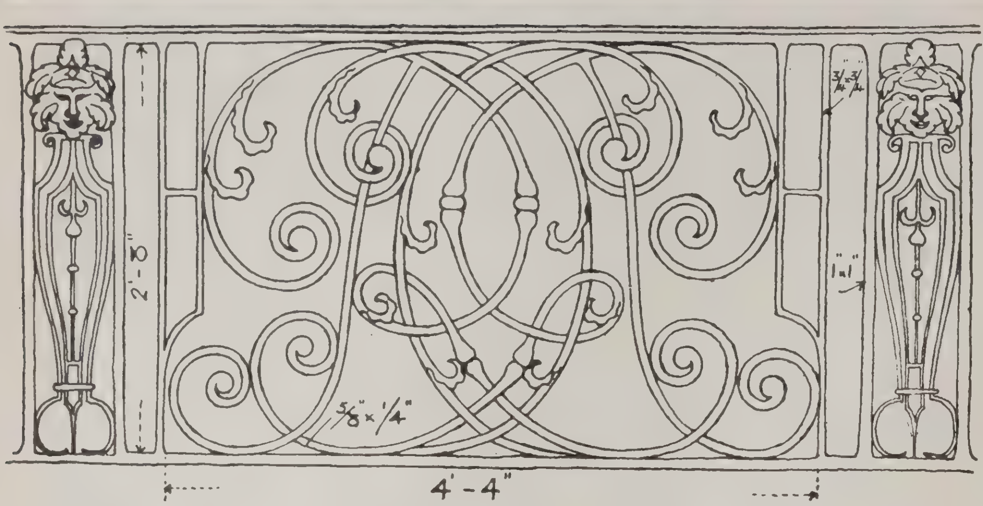


GATES, NO. 5, CHEYNE WALK, CHELSEA. *Photo: A. H. Blake.*

These gates have an interesting history. They were obviously not made for the position which they now occupy; and they seem to correspond with designs, found in the archives of the Moravians at Herrnhutt, of gates at Lindsey House, as renovated by Count Zinzendorf in 1750.

---

[*] The Parish of Chelsea (Part I). By Walter H. Godfrey, Architect, being the Second Volume of the Survey of London, and the Eleventh Publication, of the Committee for the Survey of the Memorials of Greater London. Published by the Committee, 23, Old Queen Street, Westminster, and to be obtained from B. T. Batsford, 94, High Holborn, W.C.



MONOGRAM RAILING AT QUEEN'S HOUSE, CHELSEA. DRAWN BY EDMUND L. WRATTEN.
The centre part of this railing is entirely composed of the letters RC, written backwards and forwards. The masks are finely cast.

stone balusters and low wall. The pavement was of tesselated marble, the larger squares white, the smaller black, some pieces of which may still be seen at the gate.' The central door," Mr. Godfrey comments, "would certainly make the gates seem less meaningless, but the latter would even then be quite inappropriate to the size of the house. It seems probable, too, that the former position of the door in the centre was in itself an innovation, since there is no reason to suppose that the plan of No. 5 was an exception among its fellows in the Walk." Mr. Godfrey therefore suggests that "the same occupant of the house, whose ambition required a central doorway and a large hall, effected the transfer of these three gates and piers from some larger mansion to give greater distinction to his home." Whence the gates came nothing is certainly known, but Mr. E. L. Meinertzhagen has put forward an exceedingly interesting suggestion. In the Moravian archives at Herrnhutt in Saxony are preserved certain drawings of Lindsey House, Chelsea, as renovated by Count Zinzendorf in 1750. In Mr. J. J. England's careful drawings from the originals, published in his account of the Moravian Settlements, some fine iron gates are shown on the river front, which bear a striking general resemblance to those at present before No. 5. These gates are no longer at Lindsey House, and M. Meinertzhagen supposes that they may have been bought by a resident of Chelsea who lived so near, at the time of the relinquishment of the property by the Moravians—about 1750.

The monogram railing here shown, as drawn by Mr. Edmund L. Wratten, is from Queen's House, No. 16, Cheyne Walk, formerly known as Tudor House, where it occupies the position of the plain rail over the large centre window. The interlacing initials RC are very ingeniously adapted to the space by writing them both backwards and forwards. The finely cast masks are noteworthy. Queen's House is rich in ironwork, and has some beautiful little iron balconies; but the monogram railing, although apparently of the same period as the house, which was built in 1717, was the fortunate "find" of a recent tenant.

The doorway of No. 4, Cheyne Walk, here shown, Mr. Godfrey esteems as the most beautiful of all in that row. "It consists of an elaborate hood, with carved brackets that overshadow two fine Corinthian pilasters with boldly traced foliage." Its date is probably 1718. Through this doorway "George Eliot" entered as tenant on December 3rd, 1880; and through it her body was borne to the grave ere the close of the selfsame month.

The author and his helpers are to be sincerely congratulated on a very estimable and substantial addition to the literature of topography. The society that can produce such books needs no further *apologia*. It has fully justified its existence.

THE WIDENING OF BLACKFRIARS BRIDGE.

The widened Blackfriars Bridge over the Thames was formally taken over from the contractors by the Corporation of London on August 31st, and was formally opened on September 14th. The work of widening the bridge has been in progress since February, 1907, and has proceeded uninterruptedly since that date. The contract for the whole of the work was placed with Sir William Arrol and Co., Ltd., of Glasgow, and the bridge was to be completely finished ready for traffic by February, 1910. So expeditiously has the work been carried out, that it has been finished about six months ahead of time, and within the estimated cost; and this excellent record has been made notwithstanding that the additional work for the tramways was undertaken by the firm on the understanding that it would not interfere with the completion of the main contract. It was the original intention of the Corporation to lay the tramway tracks after the main contract was completed. This is a record in bridge-building, and the creditable performance is due to the excellent arrangements and foresight displayed by Sir William Arrol and Co., Ltd.

The First Bridge.

A bridge over the Thames has existed on this site for 140 years. The first bridge was an elegant stone structure of nine arches, from designs by Mr. Robert Mylne. The foundation stone was laid on October 31st, 1760, and the bridge was completed in 1769. The completed bridge cost £166,217, of which £13,377 was for the approaches and arching over the Fleet Ditch. The increased flow of the river, consequent on the removal of old London Bridge, caused increased scour in the vicinity of old Blackfriars Bridge, and undermined the foundations.

The Present Bridge,

as it existed until the spring of 1907, was designed by Mr. Joseph Cubitt, and was the selected design in an open competition. The work was begun in June, 1864, and the bridge was opened on November 6th, 1869. The total cost was £269,000.

The bridge has a total length between abutments of 922ft., and is divided into five spans, the two abutment spans being 155ft., the two intermediate spans 174ft. 5ins., and the centre span 186ft. 5ins. The two centre piers are 18ft. 2ins. wide at the springing, and the intermediate piers are 20ft. 6ins. wide. The clear width between parapets was 75ft.

Particulars of the Widening.

Each of the piers is founded upon six independent wrought-iron caissons, four of which are rectangular in shape, and the two outer ones are curved to a radius to approximate the form of the cutwater. The caissons were sunk into the clay, with spaces of 3ft. between them, which were afterwards cleaned out and filled with concrete. The piers are built of granite ashlar with brickwork hearting, and have cutwaters ornamented with polished red granite columns having Portland stone pediments and capitals. The abutments, which have a total thickness of about 40ft., were built within coffer dams upon concrete foundations. They are formed of concrete and brickwork, and faced with granite ashlar.

Each span consisted of nine wrought-iron arched ribs spaced about 9ft. apart, with suitable cross bracing between them. The ribs supported floor girders upon braced spandrils. The granite setts of the roadway and paving of the footways are supported upon concrete resting upon buckled plates. The ornamental spandrils of the outer ribs are of cast-iron, to which an ornate fascia is bolted at the footway level. The parapet is of ornamental cast-iron.

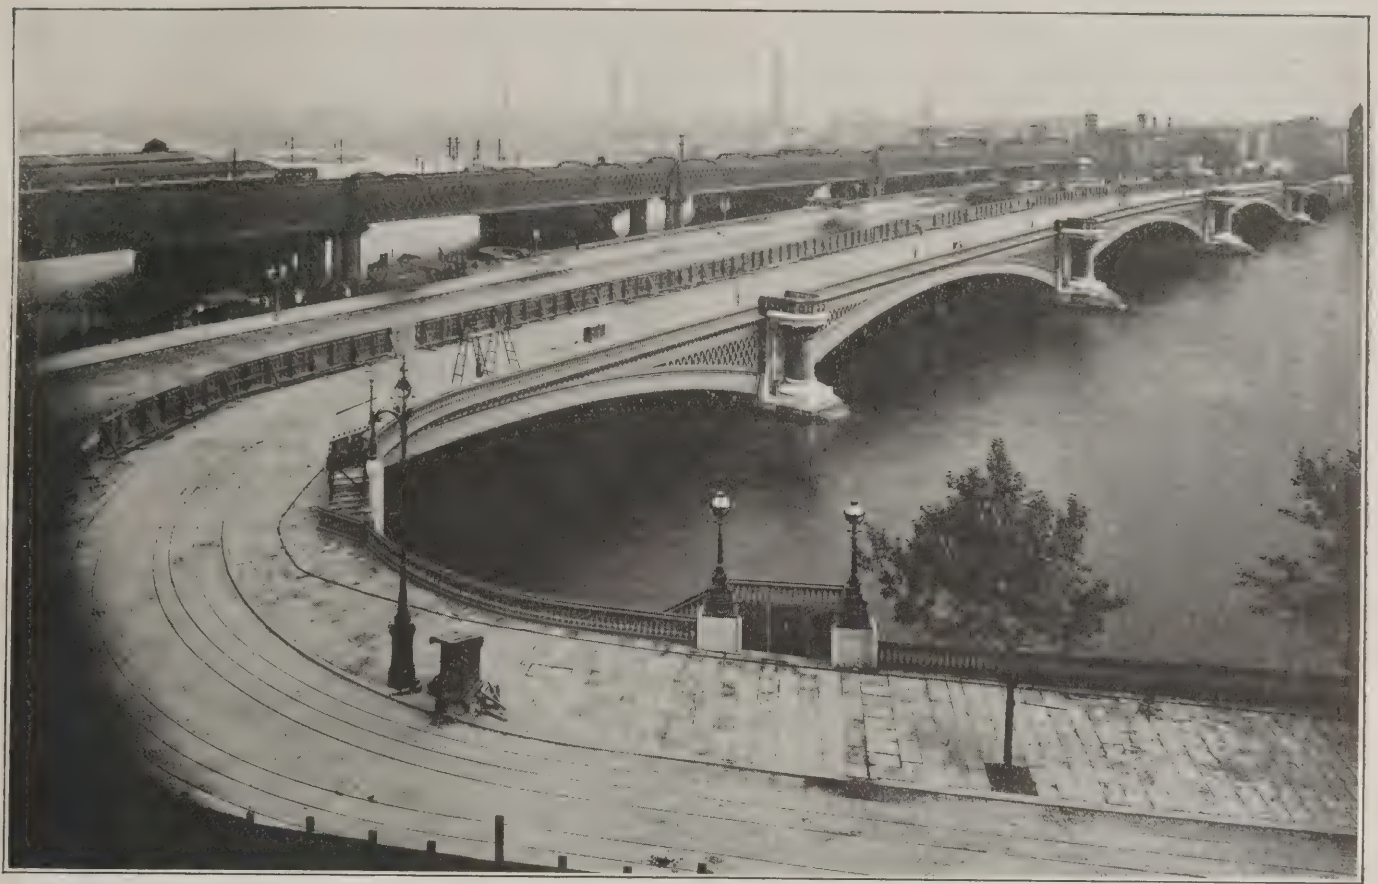
The desire of the London County Council to run their southern electric trams over the river to relieve the congestion at their termini at the bridges led the Corporation of the City of London, under whose jurisdiction the bridge is, to apply to Parliament for permission to widen the bridge to link up the trams on the Embankment with those on the south side of the river. The engineers for this work were the late Sir Benjamin Baker, K.C.B., K.C.M.G., and Mr. Basil Mott, M.Inst.C.E.

The work involved increasing the width of the roadway of the bridge from 43ft. to 73ft., providing a large curved approach from the Embankment to the north span, and laying a double line of electric tramway on the new portion of the road.

How the Work was Done.

The existing abutments and piers had to be extended 30ft. westwards. The extended piers were founded upon heart-shaped caissons, which fitted the existing cutwater caissons. These caissons were built over their final position, and lowered to the bed of the river. They were sunk under air-pressure into the clay and were filled with concrete during the process. A space of 12ins. left between the old and new caissons was cleaned out and filled with concrete. The masonry of the pier was then built up inside temporary caissons which were bolted to the permanent caissons. The cutwaters and ornamental masonry were removed from the old piers and re-erected on the extended piers. Special care had to be taken with the north abutment, on account of the proximity of the Metropolitan Railway tunnels. The new foundations were sunk lower than the old foundations of the adjacent works. The original intention was to sink one large caisson, but before beginning the work it was decided to divide the caisson into three parts to reduce the risk, and to drive a line of cast-iron sheet piling close to the underground railway to a depth beyond the level of the new foundations. After the caissons were sunk and filled with concrete, they were loaded with rails to produce a greater compression on the soil than was possible from the permanent load. The operations were successfully carried out without any disturbance to the existing works. The curve on the underground railway caused the extended abutment to be reduced in width, and the stability was maintained by building cast-iron blocks instead of brickwork into the abutment. A steel skewback girder to distribute the thrust of the arched ribs was provided at the springing level, and was securely bolted to the abutment foundations.

The south abutment was built within a coffer dam. No staging was permitted in the river except round the piers and at the north span. The steelwork of the north span was built upon centering supported upon this staging. It was a condition of the contract that the existing face ribs, with their cast iron spandrils and parapets, should be removed and re-erected as the



THE WIDENING OF BLACKFRIARS BRIDGE. THE LATE SIR BENJAMIN BAKER, AND BASIL MOTT, M.INST.C E., ENGINEERS.

The work involved increasing the width of the roadway of the bridge from 42ft. to 73ft., providing a large curved approach from the Embankment to the north span, and laying a double line of electric tramway on the new portion of the road. Sir William Arrol and Co., are the contractors.

face ribs of the widened bridge. This was done by means of an overhead traveller, which was built over each face rib after the piers had been extended. By means of suspenders from the traveller passing under the rib, the complete rib with the cast-iron spandrils and parapets was lifted from its bearings and traversed 30ft. westwards and lowered into its final position. The rib was steadied by transverse girders, which were secured to the face rib at one end and passed through suitable slippers on the last remaining rib of the old bridge. After the face rib was in position, these cross girders were secured to the ribs on each side of the 30ft. gap, and served as staging upon which to erect the three new steel ribs of the widened bridge.

In moving the face ribs to their new position, care was taken to transfer them in the order which would produce the least unbalanced thrusts upon the new piers.

The successful completion of this work so much within the contract time is a matter of congratulation to the Corporation of the City of London, the engineers, and Sir William Arrol and Co., Limited.

The Bridge Reopened.

The bridge was thrown open for traffic on Tuesday, September 14th. The occasion was rendered more important by the opening at the same time of the London County Council's tramway service across the bridge, which is now the widest bridge in London, having a width of 105ft. between the parapets, instead of 75ft. as formerly. The work of partial reconstruction has been carried out at a cost of £203,000.

The ceremony aroused much popular interest, and great crowds assembled, both at the north and the south approaches, to see the passage of the first tramcars across the bridge. Among those present were Mr. John Burns, M.P., Dr. Macnamara, M.P., Mr. T. McKinnon Wood, M.P., Lord Michelham, Sir William Arrol, Mr. Basil Mott (the engineer under whose directions the bridge has been widened), Mr. A. C. Morton, M.P., and Lieutenant-Colonel Probyn.

The Lord Mayor said that when this bridge and the other bridges over the Thames were first erected, the traffic problems of the metropolis were either nonexistent or were far different from what they are to-day. The tramway system had not come into operation, the Thames Embankment had not been completed, and motor traction was unknown. Consequently the bridges of London had gradually become hopelessly inadequate for the altered methods of locomotion. In these circumstances, the Corporation, acting through their Bridge House Estates Committee, assented to the request of the London County Council to widen this bridge to admit of the passage of their tramways over it, and the Corporation and the Council were there in happy unison to celebrate the completion of a work so beneficial to the metropolis. By the efficiency of the engineers and contractors, the undertaking had been completed some months in advance of the contract time. No delay in reopening the bridge had arisen, for the work was only absolutely finished the night before.

The Lord Mayor then walked into the roadway and removed a crimson cord which had been stretched across the new portion of the bridge.

Afterwards Mr. Deputy Algar, on behalf of the committee, presented to the Lord Mayor a silver rose-water dish, upon the surface of which was engraved a representation of the widened bridge, together with an inscription.

A few moments later a gaily-decorated tramcar, driven by Mr. A. L. C. Fell, the chief officer of the London County Council tramways, approached from the terminus at John Carpenter Street. Within it were Sir Melvill Beachcroft (Chairman of the Council), and the following members:—Sir John McDougall, Mr. Evan Spicer, Mr. W. R. W. Peel, M.P., Mr. A. Shirley Benn (Chairman of the Highways Committee), Captain Hemphill, Mr. H. J. Glanville, and Mr. J. Lort-Williams, with Mr. G. L. Gomme (Clerk of the Council). The car came to a standstill in front of the Lord Mayor, and the passengers alighted.

Sir Melvill Beachcroft, addressing the Lord Mayor, said that at the instance of the London County Council and its Highways Committee, as representing the Tramways Authority for London, he was deputed to ask permission for the cars to pass over the newly widened Blackfriars Bridge. In making this request he desired to say how sensible the County Council was of the great assistance which the Corporation of London had afforded the inhabitants of London by rendering possible the passage of tramcars by means of the widened bridge. The opening of the bridge for the tramway would relieve the congestion of traffic in Blackfriars Road, which had long been a source of danger and discomfort to travellers. and would add another invaluable link between the Council northern and southern tramways—a work the importance of which in its relation to the problem of London traffic could not be over-estimated.

The Lord Mayor said that this was one of those requests which were granted as soon as asked, and he had great pleasure in giving the desired assent.

Sir Melvill Beachcroft thanked the Lord Mayor, and invited him, together with the Sheriffs and other members of the party, to enter the car and travel across the bridge in it.

The Lord Mayor accepted the invitation, and himself drove the car across the bridge and back again to the pavilion. Four other cars, filled, like the first, with the guests of the Council, also made the journey, amid the cheers of the people.

In the course of the afternoon through services of cars along the Embankment and across Blackfriars and Westminster bridges were begun.

NOTES ON PAINTING AND DECORATION.

By Arthur Seymour Jennings.

Purity of Pigments.

In discussing the question of the purity of colours, one is apt to get into difficulties unless great care is exercised, because, as a matter of fact, in the case of many colours, no standard of purity really exists. Take Brunswick green for example. Here we have a colour which is made up of a mixture of chrome yellow and Prussian blue, both being precipitated together on a suitable base, which is usually either gypsum or barytes. The percentage of actual colouring matter varies largely in different makes, and an average sample of good Brunswick green should contain at least 25 per cent. "But why," one might ask, "is so large a proportion of white base allowed in the case of this green, when it is looked upon as being so objectionable in other colours?" The answer is simple. These greens are very rarely used for tinting (i.e., mixed with white), but are employed as "body colours." That is, they are used without admixture, unless it be the addition of a little umber or sienna to correct the shade. For this reason there would be no particular benefit in using a pure colour; in fact, there would be a loss, for while the pure pigment might cover a little better than the one struck on a base, the small advantage would certainly not compensate for the increased price. When green is required for tinting, however, those which are strictly pure will be found to be the most economical, and therefore preferable.

It must not be thought that if chrome green, made only of pure chrome yellow and Prussian blue, were used, it would be more durable or lasting than one precipitated on a base, in the manner suggested. It would probably not last so long under ordinary conditions, because the inert base would be absent, while all of the colour itself would be subject to the influences which affect chrome yellow (such as sulphuretted hydrogen) or Prussian blue (such as alkali), both of which equally affects the two when they are made up together to form green. If there is a base of 57 per cent. of gypsum or barytes, it will not be affected by those agencies. A consideration of all the facts mentioned will clearly indicate that purity in paints is not always an unmixed blessing.

Harmless Sophistication of Paints.

The average paint user, whether he be painter, property owner, engineer, or architect, is inclined to look upon both barytes and gypsum as adulterants pure and simple, which greatly lower the value of a paint and render it liable to peel, crack, blister, and "go wrong" generally. But this is all nonsense; there are many thousands of tons of the minerals mentioned that are used in paint every year without the slightest detriment to its lasting qualities. If barytes only possessed body or opacity in the same degree as white lead, it would make an infinitely better paint than that much lauded but poisonous pigment. As barytes is deficient in body, it is necessary to use it with care and in comparatively small proportions. It should be fully understood that in these remarks there is no intention to justify its use in pigments which are sold as pure. If one orders pure white lead one expects to get it, and no sophistry as to a little barytes actually helping the durability can be accepted. We all want to receive what we pay for. Those who imagine that gypsum or calcium sulphate cannot be used under any conditions as a paint, should take the case of Venetian red, which often consists of from 60 to 80 per cent. of gypsum, the remainder being chiefly ferric oxide. Yet this description of red is most durable, and it is largely employed for painting railway carriages. In such a position a paint is of course subject to the most severe tests, not only because of the sand, dust, and clinkers from the engine, which are directed against it, but because of the very frequent washing and scrubbing of the surface of the paint, which is essential in this class of work.

The Conservative Workman.

Steel wool, which was introduced into this country some few years since, to take the place of sandpaper, or, to use the more appropriate term, "glasspaper," does not appear to have succeeded so well as its merits led one to expect. This material consists of very fine shreds of steel, which are used in an irregular bunch-like cotton waste, but with this difference, each of the fine shreds has a very sharp edge, and by means of a bunch of the "wool," paint work may be rubbed down to a smooth surface in much less time than it could possibly be done with glasspaper. "Why then," it may be asked, "did not the steel wool succeed?" Simply because it is necessary for the operator in using it to wear gloves, so as to protect the hands, and this the workmen refused to do. It is certain that the average English workman is deplorably conservative in his methods, and hesitates long before adopting any improvement, however great, which necessitates some variation in the method of applying his materials or doing his work, and inventors and manufacturers know this often to their cost. Take for example an ingenious little machine of American origin which is intended to expedite the trimming of the margins from wall paper. It consists simply of a long steel straight edge, affixed to the edge of a table, and the actual cutting is done by means of a long sharp-edged knife, which really forms, when combined with the straight edge, a lengthened pair of scissors. Now, in actual working the paper is first pasted—a practice almost universal in America—the paper is then folded over, so that two pasted surfaces meet, and then the cutting through the two thicknesses of paper is done easily enough. This wall-paper trimmer has had a good sale, but the great obstacle to its general adoption is this—the workmen refuse to cut the paper after it is pasted. They had been in the habit all their lives of cutting the paper dry, and they would prefer—or at least some of them would—to be out of work rather than to change their methods, although it would only involve a couple of hours' close application to become quite expert with the new method. One is reminded of the old joke of the "super" at a theatrical rehearsal, who was told that he must enter the stage from the opposite side, and who exclaimed in great distress, "My word! More study!"

Preference for "the Mixture as Before."

In painters' materials the same condition of things exists to-day. Manufacturers with their elaborate laboratories make expensive investigations and experiments, often extending over years, and eventually place on the market something which it is abundantly clear is a great improvement upon that which has been previously used. The employer may be persuaded to try the new material, but the workmen as a rule condemn it without mercy, for the only reason that it is not to be used precisely in the same way as the material has been in the habit of using. One would think that washable water paints had now been sold and used long enough to have proved their vast superiority to ordinary distemper. Yet, it is probably no exaggeration to say that nine out of ten journeymen painters, if closely questioned, would condemn the improved article and vote in favour of the old-fashioned distemper, with all its smell and other objections. "I don't believe in them new fangled water paints," is the remark that has often been made to me. And enquiry has shown that those who have objected to them have either never actually used them at all, or, if they have, have failed to follow the plain directions laid down for their use.

New Wallpaper Designs.

There are some exceptionally handsome designs in wall-paper in the pattern books now being prepared for the New Year, and it is satisfactory to note that the "extension" or "adaptable" series of designs are more prominent than ever. In a number of cases the frieze takes the form of one or more panels separated by suitable ornament, but the panels may be extended or reduced to any size required, according to the size of the room, so that an apartment may be decorated with these papers in a really artistic manner without difficulty and at a moderate expense. Architects are called upon to choose paper-hangings but comparatively rarely—as a rule, only in the case of large houses, where expensive decorations are to be used. Yet a man of good taste might render valuable services to his

clients if he would, even in the smaller property, lend a hand in choosing the wall-hangings, even though they were to cost but sixpence or a shilling a piece. The custom, of course, is to allow tenants to choose their own hangings, but as a rule tenants are wholly incompetent to make the choice for themselves, and it is much better to finish the walls in some quiet and refined decoration than it is to leave them to the mercy of those who will be almost certain to spoil the appearance of the property by their stupid choice.

Obituary.

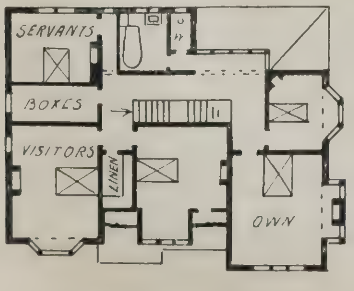
The death took place on September 1st, at Brierley Hill, of Mr. Mark Rollinson, architect and surveyor, after an illness of some two months' duration. Mr. Rollinson was about seventy-five, and was the oldest public servant in the district, having in various capacities held public offices for approaching forty years. He served on the old Local Board, and on the Urban Council (being chairman of both bodies), was for thirty-one years a member of the Stourbridge Board of Guardians, and for twenty years a churchwarden at St. Michael's Church.

Death of Mr. C. F. McKim, of McKim, Meade, and White.

We greatly regret to record the death of Mr. Charles F. McKim, senior partner of McKim, Meade, and White. Mr. McKim died on Tuesday, September 14th, of heart disease.

The firm of which Mr. McKim was the head has built a very large number of important buildings, both public and private, in America, including the magnificent new terminus of the Pennsylvania Railroad in New York, which is now nearing completion, and an exquisite small library for Mr. J. Pierpont Morgan. As Mr. Francis S. Swales remarked in his paper on American architecture, read to the R.I.B.A. last autumn, the publication of the early studies by Mr. McKim for the Boston Public Library, which clearly showed that it owed its inspiration to the library of St. Geneviève, Paris, had a very beneficent influence, and for several years was regarded by architects, as well as by the public generally, as the finest example of architecture in the United States.

In the 'eighties and 'nineties, Messrs. McKim, Meade, and White produced several works in the Italian Renaissance style—the Villard houses and the Century Club; the Madison Square Garden, with the tower similar to the Giralda of Seville, and the "New York Herald" building, by Stanford White. After the Columbia Exhibition, his influence was not less than that of any other of the band whose reputations were made or exalted by this turning-point of the renaissance of American architecture. His influence on the younger men has been enormous; and he was among the first to insist on the restraint and repose in which the architecture of the States was sadly lacking.



FIRST FLOOR PLAN.

Our Plate.

A'Beckett's, West Lavington, Wilts.

This house has been built for Mr. H. Thomas Holloway, J.P., and is situate in Wiltshire, on the site of the house once occupied by the historical A'Becketts. Externally, the walls are faced with small thin red bricks, 2⅛in. thick, and Bath stone dressings; the roof being covered with red tiles (made on the estate, as also were the bricks). By the incorporation of a part of the old house, a charming and picturesque effect has been obtained in connection with the fine oak staircase, the different floor levels of the old and new parts of the house being cleverly arranged. The old portion here mentioned forms a dignified hall of ample dimensions, 33ft. by 15ft. The joinery and floors on the ground floor are in oak, and are exceptionally well executed, whilst the walls of the dining-room and garden hall are panelled, the panels being filled in with fine old Spanish leather. The house is heated throughout by hot-water radiators, and lighted by electricity, the latter being generated on the estate, the plant for which also supplies the motive power for pumps, laundry, and dairy. The architect is Mr. Edward Warren, F.R.I.B.A., F.S.A.

House at Beaconsfield, Bucks.

This house is being erected for Mr. Herbert Foulds, on an elevated site commanding good views of the surrounding country. In arranging the plan, the principal rooms have been placed so as to take full advantage of these views, and at the same time to be sunny and have good aspects. The building will be faced with purple bricks, bands and quoins of a brighter red brick, Ham Hill stone dressings to entrance, etc., and red roofing tiles. The hall will be panelled in pitch pine, stained dark, and the ground floor will have a solid pitch-pine block flooring. The architect is Mr. Harold Harlock, of Ealing.

Great Roke, Witley, Surrey.

This house, which was the subject of our centre plate last week, is now in course of erection, and occupies the crown of a hilly site on the borders of the village of Witley, Surrey. The walling externally is faced with local stone, quarried within two hundred yards of the site, built in random rubble with thin coursed rubble quoins and strings. The dressings for doors and windows are of Doulting stone. The chimneys are of local bricks of excellent colour, and the roofs are covered with hand-made tiles, sand-faced. Messrs. Henry Lovatt, of Darlington Street, Wolverhampton, are the general contractors for the work. The casements and leaded lights and heating arrangements are being supplied by Messrs. Henry Hope and Sons, of Birmingham. Messrs. Buckland and Haywood Farmer are the architects.

Proposed New Works.

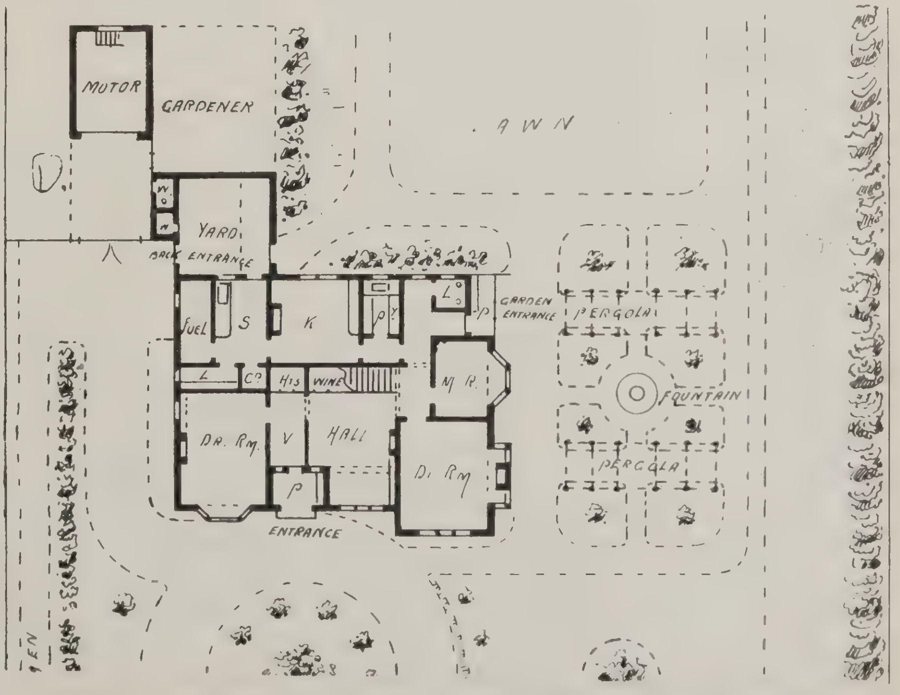
BLACKBURN.—The Town Council have adopted a resolution applying for £80,000 to defray the cost of proposed buildings at Blakey Moor.

EXETER.—The Royal Albert Memorial Committee have recommended to the City Council that application be made to the Board of Education for a grant of three-quarters of the cost of the site and the building of the proposed Day Training College and University extension, including architects' fees, etc. Application is to be made to the Local Government Board for sanction to borrow the sum of money required.

FRIERN BARNET.—The church of St. Peter-le-Poer, Old Broad Street, London, which was demolished a year or so ago, is to be "re-created" here, at a cost of £10,000. The site of the church in Broad Street was sold for £90,000.

HARROGATE.—The Town Council are considering alternative schemes for concentrating the various municipal offices under one roof. One of these is to convert the old town hall, which is now occupied as an Indian art exhibition, into municipal offices at a cost of about £2,000; the other, to erect municipal offices on the site of this town hall, at a cost of £5,000. The Local Government Board, however, seem indisposed to countenance any temporary arrangement, and a few of the bolder spirits in the town advocate the erection of a new town hall, at a cost of about £50,000.

HICKLING.—It is proposed to restore the interesting church at Hickling, which is on the Leicestershire boundary of Nottinghamshire. The fabric is a specimen of the Early English period, but successive restorations have left but little of the original work. The work to be done is mainly in connection with the roof, and is estimated to cost about £720.



HOUSE AT BEACONSFIELD, BUCKS. HAROLD HARLOCK, A.R.I.B.A., ARCHITECT. GROUND PLAN. (*See centre plate.*)

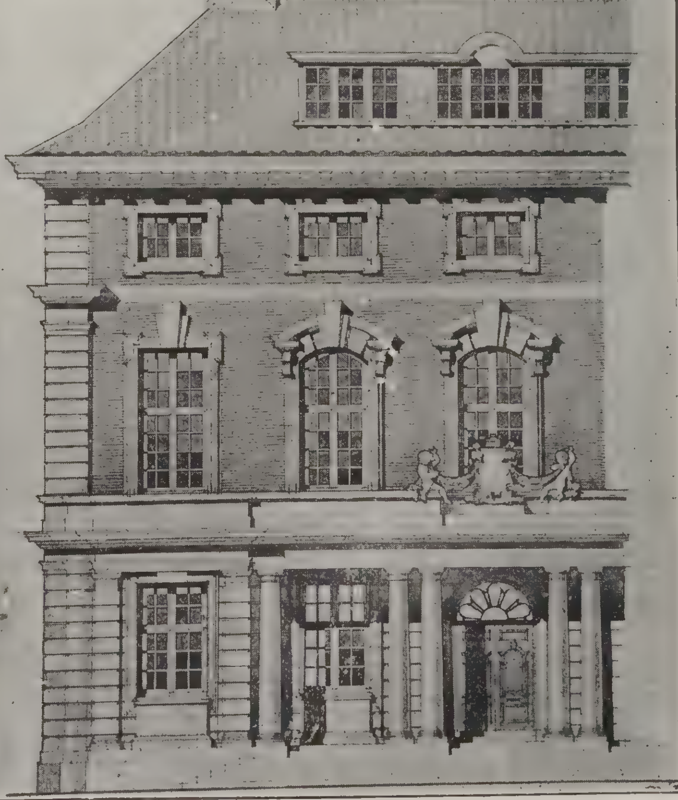
ELEVATIONS OF FIRST PREMIATED DESIGN.
WARWICK AND HALL, ARCHITECTS.



BERKSHIRE COUNTY COUNCIL OFFICES. ENLARGED DETAIL OF FIRST PREMIATED DESIGN.
WARWICK AND HALL, ARCHITECTS.
A description of the designs in this competition appeared in our last week's issue.

HILLSBOROUGH.—A new Congregationalist Church for this district is in contemplation, and is estimated to cost £1,900. A site has been secured at the junction of Wadsley Lane and Marcliffe Road.

LAKENHEATH.—The church restoration fund has now reached a total of more than £2,900, and it is proposed to restore the ancient carved oak seats, for which work a further sum of £700 is needed.

LINACRE.—The new church of St. Andrew, which it is proposed to erect here, is estimated to involve a sum of £4,000.

LONDON.—The Departmental Committee appointed to consider the most desirable place for transacting the Quarter Sessions business of London, having found themselves unable to recommend the use of the Central Criminal Court in connection with the work of the London Sessions, it is proposed to consider the district of Newington as a favourable spot for a new building.

LONDON, S.E.—A new market proposed to be erected by private enterprise near Camberwell Green, is estimated to cost over £100,000. It is intended to provide under one roof for the sale of meat, fish, vegetables, fruit, flowers, milk, and general produce. A Bill will be promoted in Parliament next Session for the scheme.

MANCHESTER.—The Manchester Baths, etc., Committee have decided to erect public wash-house and wash baths in Armitage Street, Hyde Road, Ardwick, and building operations are now in progress. The new establishment, when complete, will have 35 washing stalls, 21 wash baths for males, and 22 wash baths for females. The estimated cost is £10,000, and the scheme will be completed in from six to eight months' time.

MARGATE.—The proposal to erect a kursaal having been negatived by the refusal of the Local Government Board to grant a loan of £16,000, the Corporation are desired to submit a further proposal showing the total estimated sum for the purchase and development of the land, when there are reasonable grounds for the belief that the scheme will be favourably considered.

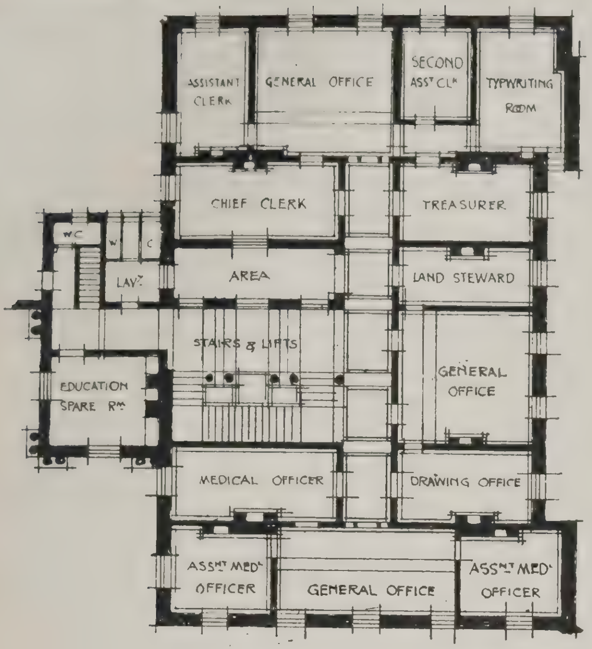
MILL HILL, HENDON.—It has been decided to perpetuate the memory of the late vicar, the Rev. Ernest Bassett Hartley, M.A., by erecting a parish hall at an estimated cost of about £2,200. A site has been acquired, and building developments are rapidly taking place.

MONTROSE.—The Suspension Bridge having been considered to be in need of repair, a report has been made, and is now in the hands of the Bridge Committee.

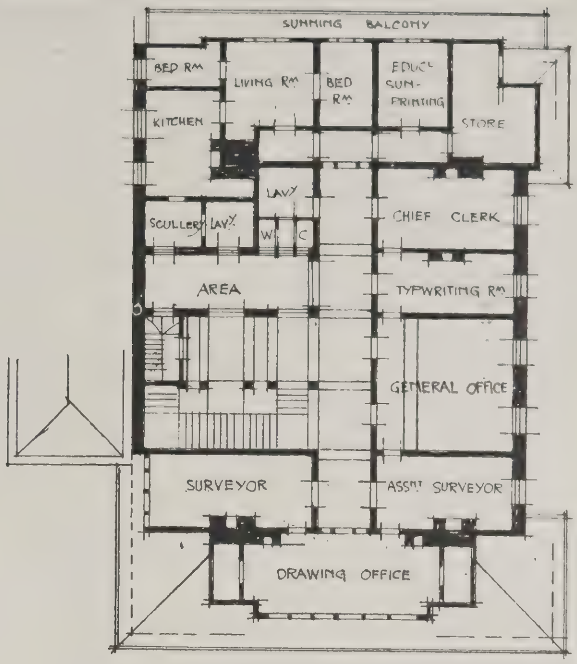
NELSON.—The Baths Committee of the Town Council have decided to recommend the adoption of a scheme for the erection of public baths at a cost of £10,500. At present, Nelson, with a population of 40,000, is without public baths.

PERTH.—Mr. James Miller, A.R.S.A., architect of Glasgow, has submitted a plan for the new infirmary, showing how the site which has been chosen can be utilised for a building with 120 beds at a cost of £36,000.

PLYMPTON.—The condition of the Church of St. Mary is causing much anxiety, the architect, Mr. J. Prynne, having reported that there are several cracks in the tower, which time will naturally widen; part of the parapet of the tower bulges out, one of the pinnacles is considerably out of perpendicular, and the top of another needs attention. The gutters and lead work of the roof require repair to prevent leakage in wet weather. It is estimated that £525 will be necessary to make the more urgent restorations.



SECOND FLOOR PLAN.



THIRD FLOOR PLAN.

BERKSHIRE COUNTY COUNCIL OFFICES. WARWICK AND HALL, ARCHITECTS.

a cost of £60,000, a new bridge, for which plans are now being prepared.

SMETHWICK.—A Local Government Board enquiry has been held at Smethwick Council House, respecting the applications of the Town Council to borrow £1,810 for the construction of a retaining wall at the Rolfe Street depot, and £2,588 for the purpose of sewerage work and street improvements in Hales Lane and Bridge Street.

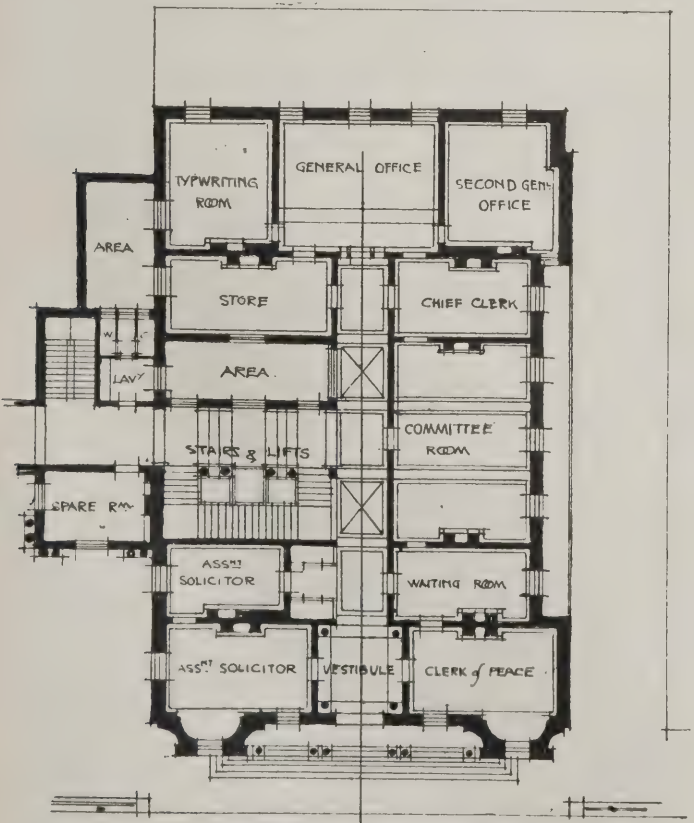
SOUTH SHIELDS.—The Libraries Committee of the Council have decided to approach Mr. Andrew Carnegie with a view to obtaining a grant of £10,000 or £15,000 for the purpose of erecting and equipping a new library.

WAKEFIELD.—The erection of a new school having become necessary by the prevalent state of overcrowding, the Education Committee have decided to requisition the purchase of a site at a cost of £1,500.

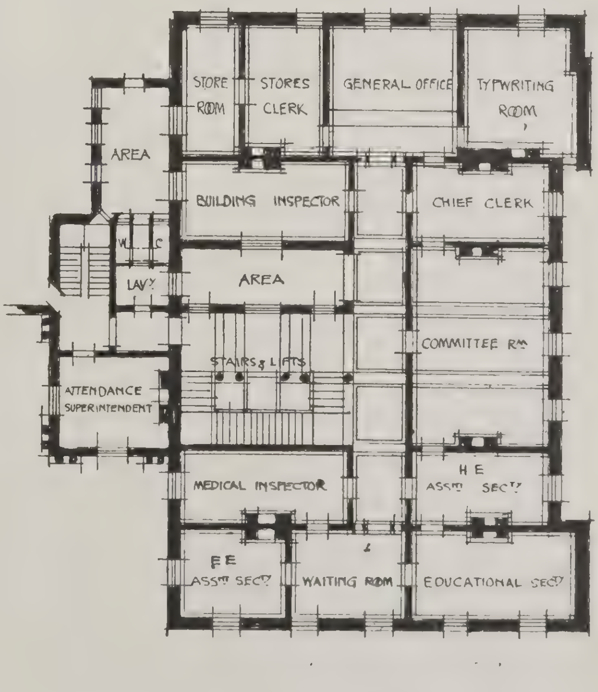
WALLINGTON.—A site has been secured on the Park Hill Road on which it is proposed to erect a new church for the parish of Holy Trinity.

WATFORD.—In this rapidly developing town, church extension has become necessary, and steps are being taken for the erection of a church to cost about £8,000.

WESTON-UNDER-PENYARD.—As a result of a meeting convened to decide whether the existing schools should be retained under the rule of the Church, or whether the erection of a new block of buildings was desirable, the Hereford County Council have been recommended to adopt the latter suggestion.



GROUND FLOOR PLAN



FIRST FLOOR PLAN.

BERKSHIRE COUNTY COUNTY COUNCIL OFFICES. WARWICK AND HALL, ARCHITECTS.

These plans are not photographic, but have been re-drawn from the originals. A photographic reproduction of the basement plan appears on the next page. In reviewing this competition in last week's issue, our contributor described this as "a good symmetrical and economical plan. Access to all parts of the building has been well considered."

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns

Short Formulæ for Reinforced Concrete.

LIVERPOOL.—I. C. writes: "Would you favour me with the name of a small text book on "Short Formulæ for Concrete and Steel Work?"

—We are not acquainted with any publication giving a collection of short formulæ for reinforced concrete. Such formulæ are usually drawn up by specialist engineers to suit their own requirements, and indeed, their methods are not usually divulged. Those who have made a special study of the same, however, can usually draw up satisfactory formulæ, which are just as suitable and are far preferable for practical use to the elaborate formulæ one finds in text books.

Hair for Plastering.

BLACKBURN.—T. A. writes: "Can you give me the address of a firm who supply cows' and goats' hair for plastering?"

—The following are the manufacturers of plasterers' hair:—A. H. Lavers and Co., 103, Wandsworth Road, Nine Elms, London, S.W.; Joseph Robinson and Co., Ltd., 10, Croom's Hill, Greenwich, S.E.; Hutchinson Brothers, 111, Grays Road West, Middlesbrough; Joseph Duce, Lowndes Lane, Stockport.

Kiln Drying of Wood.

YORKSHIRE. — M. of the Y.H. writes:—"Can you give any information about a cheap system of kiln drying of wood? It will be small in section but require doing quickly. Hardwood mostly."

—It is impossible to offer any useful advice on this point without knowing the internal arrangement of the mill, but the most economical system of kiln drying in vogue in London is that in which hot air pipes (or in some cases, steam) are introduced from the furnace to a brick-built apartment of the smallest possible dimensions consistent with the bulk of the material to be dried. Mills with such drying room usually desiccate for the trade at from £1 to 30s. per standard. Of course the actual cost would be very much less than this where the process is more or less continuous. J. DAVIES.

Quality of Basswood.

Supplementing the information on this subject given a fortnight ago, if a uniform shade of light brown is required, "canary whitewood selected for even colour" should be specified. Ordinary basswood does, however tone down considerably in time, if exposed to air and light, and the colour is then not unpleasantly varied. I have used a considerable quantity of basswood left from the tool, but a caution is necessary as to its use in large widths. It is very much affected by changes of the atmosphere, swelling and shrinking freely from this cause when left unpainted or unstained-and-polished. It should accordingly be used only in fairly narrow widths, and all panels should be left quite free to move, and with a very wide margin, and deep groove in the stiles. Otherwise, when shrinkage occurs, daylight may show through.

Rating of Workshops.

SURREY.—COTTERILL writes: "I should be much obliged if you can inform me if a shed erected for use of workmen during the erection of buildings is liable to be rated. I have received a demand for rates on account of a shed used as a carpenters' shop, and should like to know if it is in order?"

—The question raised is not free from difficulty. In deciding whether a particular building is reliable, one has to consider whether it is beneficially occupied. The law is thus stated in a well-known work ("Ryde on Rating," p. 76) that:—"Suppose that promoters are constructing a large reservoir, and build temporary huts for housing their workmen on land specially taken for the purpose, outside the site of the reservoir, and entirely separated from it by a highway, it must apparently be admitted that either the promoters or their workmen are rateable as occupiers of the huts. On the other hand, suppose that the promoters, in constructing a warehouse, use one of the rooms temporarily as a workshop for the carpenters engaged on the works, it would be hardly possible to contend that the promoters are rateable as beneficial occupiers of that particular room." Having regard to this statement, it would seem that a building capable of separate occupation apart from the works which are being constructed, may be rated if beneficially occupied. Hence the carpenters' shed under consideration is probably rateable. But querist will be well advised to resist payment in the first instance, as if the amount is small, the rating authority may not consider it worth while to press the matter if any sort of a fight is shown.

BARRISTER.

Henry VII.'s Chapel, Westminster.

BLACKPOOL.—"PROGRESS" writes: "Please oblige with an account of Henry VII.'s chapel at Westminster."

—Henry VIII.'s Chapel was commenced in 1502 and was intended by its founder to serve as a chantry and contain his tomb. It covers the site of the Lady Chapel of Henry III. and consists of a nave with apsidal end, two side aisles, and five small apsidal chapels. It is approached from the Abbey retro-choir by a broad flight of steps and impressively darkened lobby, with which exception it is detached from the main building and has its own independent west window as at the Lady Chapel at Gloucester. The high vault is supported by 14 turret-shaped buttresses in the aisle walls, with

WHITTINGTON COURT. FROM A SKETCH BY H. TANNER, F.R.I.B.A.

This sketch was made during the fortieth excursion of the Architectural Association, which was to Cheltenham and neighbourhood. Whittington Court is a seventeenth century stone-built house, with tone slates. The sketch is reproduced by permission from the "Architectural Association Journal."

flying buttresses to the clerestory. Practically all the remaining surface is glazed. The whole exterior is covered with a lace-like pattern of minute tracery, and thousands of roses, portcullises, fleur de lys, lions, dragons, and greyhounds. All this ornament had become very much decayed, and was restored by Wyatt in the early 19th century. The interior of the chapel contains many points of interest, chief among them its marvellous fan vaulting—one of the most startling constructive achievements of the Middle Ages. The main traverse ribs form a series of slightly pointed arches, each of which appears to go through a vast circular pendant suspended quite clear of the walls and from which fan tracery spreads over the whole vault. The construction of the vault has been analysed and described by Professor Willis in the R.I.B.A. Transactions vol. I., part 2 (1842). Despite its sensational appearance, it is as sound as any vault can be, but a series of iron tierods was added by Sir Christopher Wren. At the east end of the Chapel stands King Henry VII.'s tomb, the work of Pietro Torregiano, with two finely sculptured effigies of the King and his Consort. This is presumably the earliest introduction of Renaissance detail in England. Surrounding the tomb is a fine brass screen of English workmanship—a worthy fellow to the noble brass gates at the entrance to the Chapel. Mary Queen of Scots and Elizabeth are buried beneath their respective monuments in the north and south aisles. Other Stuart and Hanoverian kings are buried in the Chapel, but without monuments. The double range of oak stalls on either side of the Chapel, with their earlier misereres, are deserving of close attention. Unfortunately none of the original glass, which must have had a large share in the effect of the interior, remains in the windows. A good recent guide to Westminster Abbey by Mr. Francis Bond is published by Henry Frowde, price 1s. net.

R.I.B.A. Examination Questions & Answers.

SUNDERLAND.—E. P. writes:—"Can the numbers of the "Builders' Journal" published in 1906, and containing model answers to R.I.B.A. examinations still be obtained?"

—The issues for July 11, July 25, September 5, September 26, October 17, October 31, and December 5, all in 1906, and each containing model answers to the questions set in R.I.B.A. examinations, can still be obtained from our publishers, 6, Great New Street, London, E.C., to whom application should be made.

Connecting to Main Sewer.

LONDON.—TEMPLE writes:— "A client of mine has four cottages in the S.E. district of London. These cottages are situated in an isolated position, and are drained into a cesspool. There are no other houses in the near vicinity. The borough council have recently brought the main sewer down the road and insist upon these cottages being drained into it, but as the sewer is not low enough to take the drains from the back addition, where are placed the w.c.'s of each cottage, it will necessitate my client re-building the back addition containing the w.c.'s and raising the whole about 4ft. in order to get the necessary fall to the drain. Can my client decline to do this on the ground that as the sewer is, it is not possible for this to be done?"

—It is not easy to see upon what grounds the borough council claim the right to make "Temple's" client alter his existing sewerage system. While S. 23 of the Public Health Act, 1875, permits a local authority to enforce the drainage of undrained houses, that section does not enable a local authority to require an owner to alter his system of drainage, if that system is in fact sufficient in itself (Attorney-General v. Clerkenwell Vestry, 1891, 3ch. 527). In the later case of St. Martin-in-the-Fields (Vestry) v. Ward (1897), 1, Q.B., 40, it was decided that the local authority cannot, under this section, require an owner to provide new drains communicating with a new sewer which they have constructed. It is apprehended from the statement of facts that the cottages in question are old cottages. If not, they may come under the jurisdiction which the local authority may exercise over new houses under S. 24 of the Public Health Act. Having regard to the cases above cited, it would seem that the demand of the borough council ought to be resisted. A solicitor should, however, be consulted, because local authorities are generally well advised when they move in matters of this kind, and heavy expense may result from resistance to their lawful demands.

H.

Society of Architects' Examinations.

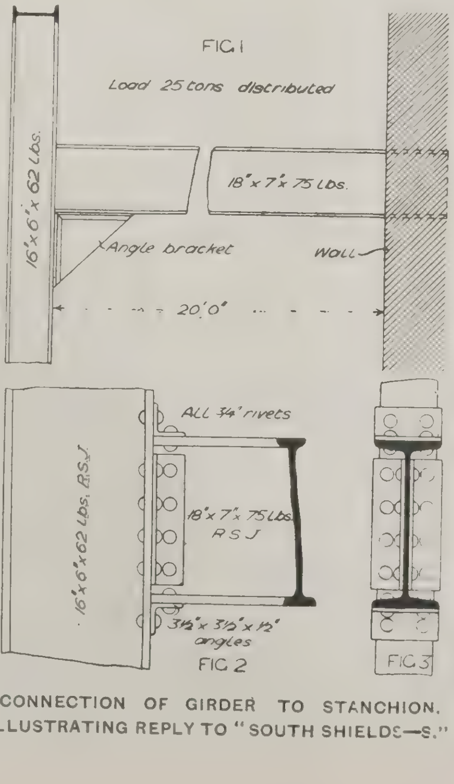
In reply to a correspondent who asks "what text-books are suitable for study to pass the Society of Architects' Examination," Mr. C. McArthur Butler, secretary of the Society, kindly states that his Council have not thought it advisable to continue recommending books, and the list which was published some years ago is out of date to some extent. Mr. Butler thinks that the better way would be for our correspondent to obtain a copy of the syllabus and of the past examination papers, which will enable him to ascertain the lines on which he should direct his studies.

Connection of Girder to Stanchion.

SOUTH SHIELDS.—"S." writes: "An 18in. by 7in. by 75lbs. R.S.J., 20ft. 0in. span carries a distributed load of 25 tons. One end is built into wall, and the other has to be attached to an existing 16in. by 6in. by 62lbs. R.S.J. stanchion by means of an angle bracket, as shown on sketch enclosed. Please show the calculation necessary for the angle bracket attachment between joist and stanchion."

—The sketch submitted being shown in Fig. 1, the building into the wall that is indicated is not sufficient to alter the character of the bending moment, and the ends of the joist must be considered to be simply supported. In order to derive any benefit from building in to obtain a reduction of the stresses, it must occupy a length not less than four times the depth, with a stone template underneath at face of wall and on top at extreme end. The bracket shown to support the girder is of an unusual character, and has quite an unnecessary projection, unless the main object is to stiffen the stanchion against racking. The ordinary mode of constructing the joint would be as shown in Fig. 2 elevation, and Fig. 3 section. It is not usual to have a girder wider than the stanchion, and it is possible that the stresses on the latter have been underestimated.

HENRY ADAMS.



CONNECTION OF GIRDER TO STANCHION.
ILLUSTRATING REPLY TO "SOUTH SHIELDS—S."

INTERNATIONAL TESTING OF MATERIALS.

At the fifth triennial Congress of the International Association for Testing Materials, which was held in Copenhagen, September 7th-11th, Dr. W. Exner said that a reform in some of the methods of testing was urgently needed, and that the question ought to be dealt with by international agreement. He contended that the matter should be made the subject of inquiry by the Governments of all countries interested. A lively discussion followed the presentation of this report, and the matter is certain to attract further attention. In some countries testing establishments are maintained by the State, but in this country the majority of the testing plants are in private hands.

Mr. T. Grut presided over the cement section of the Congress. The report of the committee, presented by the Chairman (Prof. F. Schüle), with its five appendices and its record of experiences gained in the employment of reinforced concrete, is, says a "Times" correspondent, a valuable addition to the practical side of the subject which will be frequently consulted by engineers. There were, in addition, papers dealing with casualties in reinforced concrete building, deformations under service conditions, and the influence of loading upon adhesion between the steel and concrete. The meetings of this section were extremely well attended and a large number of members participated in the discussion. The papers and the reports were presented in the fewest possible words. The discussion turned on matters of principle rather than those connected with detail, the object aimed at being to systematise methods of testing so that experiments carried out in different countries may be made comparable. Mr. C. Rabut, Mr. C. Segré, Mr. Kirsch, Mr. A. Hüset, and Mr. E. O. Sachs were among those who took part in the discussion. The programme for future work is very comprehensive, including a general study of the properties of reinforced concrete by bending-compression and shearing, the physical properties of the material, the influence of external agents, study of accidents and their causes, and practical methods for the testing and the periodical inspection of the material.

At the recent meeting of the International Commission on Reinforced Concrete, 14 countries were represented, and important business was under consideration. One portion of the work to be undertaken relates to the unification of algebraical notation, and other subjects related to tests still required to complete data, and the standardising of methods of publishing reports on such tests, the existing methods of publication being likely to create confusion and make the work of comparison extremely difficult. In regard to uniformity of notation, Continental nations have already reached agreement, and it remains either for Great Britain and the United States to fall into line, or to set up a separate notation for English-speaking countries. Possibly, however, a compromise may be reached. With regard to presentation of test rules, Professor Schüle is to prepare a scheme for consideration. The commission will in future meet at least once in every year. The meetings of 1910 and 1911 will be in Europe, that in 1912 in the United States. Professor Schüle was re-elected chairman of the commission.

A large group of papers was concerned with the progress made in methods of testing cements. Professor Schüle presented the report of the committee and made suggestions for a programme of future work. The experiments at present made point to the simplicity and advantages of testing cements by means of prisms made from plastic mortar, and it is held to be the solution of the question as to equal capacity of the tensile and compression test samples. It also gives to the compression tests the importance they deserve. There was a controversial debate on Mr. Bertram Blount's report, "On accelerated tests of the constancy of volume of cements." The report asked the Congress to recommend the method of Le Chatelier as the standard accelerated test for the constancy of volume. In his own practice, which covers cement of every origin, Mr. Blount has found this absolutely satisfactory to both buyer and seller. The British maker has found no difficulty in complying with it, but the German and American manufacturer have found it somewhat troublesome. After a long debate, Mr. Blount and his committee carried their recommendation, although not without a protest from the German manufacturers and consumers. There was an excellent series of papers on cement in sea water, of which the most notable was one giving ten years' experience in Scandinavia, which was presented by Mr. A. Poulsen.

Correspondence.

The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

Winchester Cathedral.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—No mention has been made, so far as I am aware, in any of the reports relating to the new concrete foundations in progress at this Cathedral, that Professor Willis, at a meeting of the Archæological Association, at Winchester, in 1845, said: "I would like to call your attention to a curious discovery that had been made only recently, viz., that a concrete foundation extending to a distance of about fifty feet from the western portion of the edifice had been laid there evidently with the intention of carrying two large towers. The limits of this foundation had been laid open by the liberality of the dean and chapter, who were anxious to render every assistance in their power likely in any way to assist the history of the Cathedral."

THOMAS POTTER.

Gantry Girders.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The solution by "D. W. R.," Edinburgh, in your issue for September 8th, is correct, but not convenient for practical use. I append herewith the full solution of bending moments and shearing forces for two equal concentrated rolling loads over a beam supported at the ends, in a form applicable to any span and any spacing of the loads:—

W = load in tons, l = span in feet, a, d, b, the segments into which the span is divided by the two loads at d feet apart. M_A M_B = the bending moments at A and B respectively. M = bending moment in centre of span, M^x = bending moment at any given distance x measured from left hand support, M_a M_b = bending moments under load at inner end of distances a and b respectively, S_A S_B = maximum shearing forces at A and B respectively, S_c = maximum shearing force in centre of span, S_x = maximum shearing force at any distance from either support to centre of span, S_a S_b S_d = shearing force with given load throughout distances a, b, d, respectively. The stroke-and-dot line is merely the reversal on A, B, of the shear ordinates above the line, and, taken in conjunction with the lower dotted line, and line A B shows how the curves are usually set off for obtaining the ordinates of maximum shear at any point of span. The bending moments and shear forces for the given position of loads are as shown.

HENRY ADAMS.

GANTRY GIRDERS.

(See letter in first column.)

THE LARGEST EXCAVATOR.

What is said to be the largest excavator ever built has just been shipped to North Africa, for use in railway building. It has a capacity greater than that of six of the largest steam shovels combined, and is intended for heavy dry excavating. It runs by its own power, travelling on two main traction wheels, each 8ft. in diameter, with a forward steering wheel, which is adjusted vertically to take varying depths of cut. Between this and the traction wheels is the excavator wheel, which is 13ft. 8ins. in diameter, and carries the buckets that do the digging. This wheel has no hub or spokes, but is guided on the inner circumference of two end rings by rollers, and is driven at each side through strong manganese steel chains, which in turn drive a jack shaft carrying sprockets engaging teeth on the sides of the excavator wheel rim. The traction wheels are also positively driven, and through two different trains of mechanism one used when the machine is being driven at relatively fast speed into position for working, and the slower speed when it is being driven forward and cutting. To keep the machine on an even keel when working over uneven ground or in varying soil there is a levelling wheel in the outer end of an outrigger pivoted on one side, and adjustable by rack and pinion so as to right it if it gets out of an upright position. At the back of the machine is mounted a 100-h.p. vertical boiler, together with the engine, which drives all movements except that of the belt conveyer. The latter, which works transversely through the excavator wheel, is driven by its own engine and receives the discharge from the buckets, and delivers it to one side of the machine into a pile or into cars or wagons. In all of the driving, sprocket wheels and chains and gears are employed, no belts being used. Exclusive of the coal-box in the rear, the machine is about 48ft. long over all, and it takes a cut 78ins. wide. The maximum depth of cut at one passage is about 5ft., and in such a cut the machine moves forward at a speed of about 10ft. a minute. The cutting speeds are correspondingly increased with smaller depths of cut, so that at a cutting depth of 1ft. the forward speed is about 50ft. per minute. Otherwise expressed, the capacity is about 325 cu. ft. of material per minute. The machine is the first of its type, and was invented by Mr. C. J. Van Buren, of New York.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct. 11.	HULL TRAINING COLLEGE for Teachers in Elementary schools. The Education Committee invites Architects to submit designs. Premiums of £150, £100, and £50 to authors of the designs placed 1st, 2nd, and 3rd respectively. Particulars and plan of site may be obtained of J. T. Riley, Secretary of Education, Albion St., Hull. Deposit, One Guinea, returnable on receipt of *bona fide* design, or the return of particulars within 14 days.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas respectively will be awarded for such two designs as shall be judged of sufficient merit by the Council, and placed by them as first and second; the premium of twenty-five guineas to be afterwards merged into the usual commission payable to the architect, provided the work is carried out by such competitor. Plan of the site and copy of the conditions may be obtained on application to the undersigned on and after the 24th instant on payment of one guinea, which will be returned on receipt of a bona-fide design. Drawings to be deposited at the Clerk's Office, Town Hall, Herne Bay, not later than noon on the 30th November next.—Joseph Jubb, Clerk to the Council, Town Hall, Herne Bay.
Nov. 1.	TECHNICAL SCHOOL. The Corporation of the Borough of Kendal invite architects residing and practising in Westmorland to submit a competitive design, together with a written description and estimate for the erection of a technical school. Premiums of £15, £10, and £5, are offered: the designs to become the property of the Corporation. Particulars may be obtained free from the Borough Surveyor.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30, and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Jan. 31, 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., which will be returned on receipt of a design in accordance with the conditions, or if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans. Hoyle, Director of the Museums, City Hall, Cardiff.
No date	WARRINGTON ELEMENTARY SCHOOL. The County Borough of Warrington Education Committee invite competitive plans for the erection of a public elementary school. Particulars on payment of £1 1s. (which will be returned on the receipt of a bona-fide set of plans), from Mr. J. Moore Murray, secretary and director, Education Office, Sankey-Street, Warrington.

Opposition to the proposal of Wimbledon Corporation to erect a new Town Hall, at a cost estimated by opponents of the scheme at £100,000, continues to make headway. Ex-Alderman Penny has been elected unopposed to fill a vacancy in Trinity Ward, with a pledge to oppose the scheme. Penny wise?

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND.

Secretary:
A. G. WHITE, 31 and 32, Bedford Street, Strand, London, W.C.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Dispute at Swansea.

It is reported from Swansea that the dispute with the operative plasterers, which has been in progress for nearly six months, is now in a fair way of settlement. Efforts have been made by a representative of the Board of Trade and by the general secretaries of the Federation and of the N.A.O.P. to obtain a reference to arbitration. Owing, however, to a strong local feeling and to some misunderstanding in regard to earlier negotiations, some difficulty was experienced, but has now been overcome. Rules have been agreed, except as to wages and hours, and it has been agreed to refer these to the decision of a Board of Trade arbitrator.

Organisation at Normanton.

Correspondence has been initiated, which it is hoped will lead to the formation of a builders' association at Normanton. This has come about through the official journal getting into the hands of a builder there, causing him to write for information. Secretaries are requested to note the advantageous use which may be made of the Journal in thus enlarging our organisation.

Collective Purchasing.

The question of collective purchasing of builders' materials is engaging the attention of one of our important local associations, and information on this point has been prepared by the National secretary, and may be availed of by any association.

Housing and Town Planning Bill.

The objectionable Clause 30 of the Housing and Town Planning Bill which called for a quinquennial survey of dwellings below a certain rental, and the provision of a public register of their condition of repair, etc., has been struck out.

New Rules with N.A.O.P.

The new rules with the N.A.O.P. are in the printers' hands, and will be shortly issued, when it will be necessary for the appointment of local joint committees to be proceeded with on similar lines to those existing for the conciliation scheme.

The Conference of Secretaries.

The following subjects for discussion at the forthcoming conference of secretaries have been suggested:—Consider and discuss report of Journal Committee (already sent out), and any recommendations arising. Paper by Mr. Hastings, on "How to Utilise the Official Journal," discussion on "The Working of Conciliation Boards from the Secretary's Point of View" (an opener of this discussion is desired, "Building Trade Organisation in France"), by the National secretary, a paper on "Contracts," by Mr. W. H. Hope, a paper by the secretary of the Scottish Federation (Mr. Cameron) on "How the Conferences have impressed me," "The position of Sub-Trades in the various towns in regard to Membership of Builders Associations."

Meetings of Committee.

The next meeting of the Administrative Committee will take place on Tuesday, October 12th, at the London offices of the Federation. The same evening the annual dinner of the Institute of Builders will be held in London. On the following day it is expected there will be a conference of representatives of this Federation, and of the Surveyors' Association in regard to tenders without quantities.—A. G. WHITE, secretary.

The Northern Centre.

Secretary: James Denver, Cromwell Buildings, Blackfriars Street, Manchester.

Northern Centre Board of Conciliation.

A special meeting of the Northern Centre Conciliation Board was held at the Hotel Metropole, King Street, Leeds, on Monday, September 13th, when an appeal was heard from the Preston local board regarding joiners' wages and working conditions. A notice had been given by the employers for a reduction in wages of 1d. per hour (from 9½d. to 8½d.), against which the operatives had given counter-notice for an advance of 1d. per hour and several alterations to the present working rules, the most important being an alteration to the boundary rule of 1¼ miles radius from the centre of the town, which had now been adopted by all the trades in Preston. After hearing the evidence from both sides, and after several propositions had been disposed of, the following settlement was ultimately carried:—"That the wages of the Preston joiners be reduced ¼d. per hour from (9½d. to 9¼d.); that Rules 1, 3, 7, 9, and 10 be altered as per particulars contained in the operatives' counter proposals to the employers. Rule 6, regarding the boundary, to remain unchanged." It was also decided that the amended rules come into operation as from Saturday, September 18th.—JAMES DENVER, employers' secretary.

Lancashire, Cheshire, and North Wales Federation.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Boardroom, Manchester, on Friday, September 10th, at 2.30, when the president (Mr. W. Cooke, jun.), presided over a good attendance of members.

Mr. W. Deakin, chairman of the Stonemasons' Trade Committee, reported the result of the arbitration in the Manchester masons' dispute, and the report was considered satisfactory.

The accounts for the quarter were examined, and recommended to the Executive Board for payment.

A circular letter was read from the National Federation calling attention to a resolution passed at the half-yearly meeting on the subject of priced schedules with quantities, and the secretary was instructed to reply that the proposal embodied in the resolution is already in practice in this district.

A communication was read from the National secretary with reference to the Conference of Secretaries, and it was decided that a circular be addressed to the secretaries of this district requesting them to submit matters for discussion at the said meeting. It was decided that the conference for secretaries of this district be held in Manchester on September 29th.

Some discussion took place on the report of the "Journal Committee" sent down by the National secretary, and it was ultimately decided to recommend the local associations to support the Journal in every possible way.

It was decided to hold the quarterly meeting of the Executive Board in Liverpool on Monday, September 27th, at 3 o'clock.—JOHN TOMLISON, secretary.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The monthly meeting of the Barnsley Federation was held at the King's Head Hotel, on Wednesday, September 8th. The president (Councillor G. Haigh) occupied the chair, the attendance of members being below the normal average.

Important correspondence was read from the secretary of the Sheffield Association re "The alleged infringement of the Fair Wages Clause," by a firm who are members of the Sheffield Association whilst executing their portion of a contract in the Barnsley district. The secretary of the Sheffield Association pointed out in his reply that the section of the works referred to did not come under the heading of "Building"; and moreover, the firm in question did not contribute to the Federation for this portion of their business. The general opinion of the members present, however, was that the particular section of the works in this case did come under the heading of "Building," and that it was a sub-section of a building contract, and was competed for by builders. Astonishment was expressed at the latitude allowing of a firm to contribute to the Federation for a section only of their business. The reply of the secretary of the Sheffield Association in the end, however, was accepted and approved, and, so far as the Barnsley Federation was concerned, the matter was allowed to drop.

A discussion took place on the advantages of insuring the various "building risks" under the Workmen's Compensation Act with the Federation as compared with other companies. The general feeling was that every member ought to insure with the Federation, thus adding directly to its power and financial success. In order to stimulate the interest in Federation insurance, the secretary was instructed to place the subject on the October meeting agenda.

Sanction was asked for and given unanimously for the plasterers' section of the Federation to form a committee in connection with the new rules of the Master Plasterers' Association, and approved by the National Federation.

Notice was given by a member that he would, at the next monthly meeting to be held in October, move the rescission of a resolution passed at the last February meeting. This was a case of a certain business in the building trade changing hands, in which the successor had declined to pay the arrears of subscription and levies due to the Federation from his predecessor, and thus retain his membership. The matter had been discussed at several meetings; and a certain latitude was allowed, an alternative having been embodied in the original resolution that the firm in question be allowed as an alternative to pay an entrance fee and subscription, therefore joining afresh as a new member. The firm in question had declined either to pay the arrears or to adopt the alternative of joining afresh, and the general feeling prevailed among the members, that the alternative should now be rescinded, and the firm in question should only now be allowed to become a member of the Federation by paying up all the arrears of subscription and levies.

A member of the Federation laid a complaint to the effect that a youth had left his employment without any due cause, and that another firm in the same line of business had taken the youth into their employment without making due inquiries as to the cause of his leaving his last master, and although the Federation member had approached the firm in question on the advice of the Federation, he could obtain no satisfaction. The meeting, whilst sympathising with the member, could do nothing further in the matter, the firm in question not being members of the Federation.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

The monthly meeting was held September 8th, the president (Mr. W. W. Mears) in the chair.

A letter was read from the Town Clerk in reference to the deputation which waited upon the Corporation some time ago, intimating that the views of the deputation had been considered by the Finance Committee, who had agreed to adopt the suggestions put forward, viz.: that Corporation jobs of the value of not more than £100 should be settled within three months, between £100 and £1,000 within six months, and over £1,000 in twelve months. This is a substantial concession, more especially when considered in conjunction with a previous ar-

ROBERT HALL,
Building Surveyor,
52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following :—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that of a Builder or Contractor.

rangement which cancelled the system of retaining 10 per cent. of the value of a contract for twelve months, and substituted for it the retention of 5 per cent. for six months, and the balance of 5 per cent. for a further six months

A further communication from the City Council referred to the question of hoardings, which arose out of a police prosecution for alleged insufficient hoardings in suburban streets in the early part of the year. It will be remembered that the Association defended the action of its members, and successfully held that the by-laws under which the prosecution was undertaken did not specifically require a close-boarded hoarding in every position. The information was allowed to be amended, and under the Public Health Act the Council succeeded in proving a technical offence. The matter subsequently formed the subject of negotiation, the result of which is that the Council have issued a new form of hoarding permit, recognising all the contentions of the Association and providing a hoarding suitable for each position, divided into three classes, viz.: (1) Strong and firmly fixed close-boarded hoards, not less than six feet high, (2) strong and firmly fixed post and rail fences, not less than four feet high, with three rails, (3) sufficient firmly placed post and rail fences, not less than four feet high. The first will obviously apply to work to be executed within the city proper, the second to suburban streets, and the third to more remote suburban sites where there is a minimum of traffic. What, however, members have to bear in mind is that a hoarding permit must be obtained in all cases.

A complaint from the Barnsley Association that a Sheffield member engaged in laying out grounds was not paying the standard rate of wages, was considered. The Barnsley Association held that the other competitors for the job were builders, who quoted on the basis of the standard rate of wages, and that the job could not by any stretch of imagination be classified under the head of "gardening." On the other hand the Sheffield member in question, whose business was mainly confined to gardening and rustic building, said that the job consisted solely in the laying out and sowing of lawns, and was distinctly a "gardening" job. Moreover, it was pointed out that the member in question paid a levy to the Association only on the portion of his business which came under the head of building, and such a job as the one referred to would not be considered to come under this heading. The Association therefore felt it impossible to adopt the view of the Barnsley Association.

The treasurer's monthly statement showed the finances of the Association to be in a healthy condition, the subscriptions collected to date being a little higher than for the corresponding period of last year.

A letter was read in reference to the Conference of Secretaries to be held at Leeds next month, and it was decided that the secretary attend same. The secretary mentioned that it was his intention to move a resolution as to the desirability of effecting greater uniformity between the operatives' working rules and the rules of the Conciliation Board, which latter he presumed in the main abrogated the former, but as matters now stood there were in some cases two sets of rules, which prescribed differential methods of procedure in certain cases.

The question of the abolition of walking time in the case of joiners and bricklayers, which has on many occasions been the subject of lengthy discussions, and also two conferences with the operatives concerned, has now reached a head. The negotiations have had no result, and practically ended for the time being with a communication from the operatives to the effect that they had always considered walking time as a substantial advantage, and could only agree to the loss of it on condition that wages were raised ½d. per hour, and that lodging money be paid on all jobs over four miles from the Sheffield Parish Church, at the rate of 6d. per night. To this the Association were unable to agree, and in accordance with the working rules, six months' notice, to expire on March 1st, 1910, had been given: (1) To abolish walking time, (2) to reduce wages ½d. per hour, and (3) to alter any other rule which might be necessary or advisable. Since the meeting the operatives have complained that the third item is indefinite, and contrary to the working rules, and the spirit of the Conciliation Board rules. To this a reply has been sent that the third item is rendered necessary by the fact that rules impinge on one another, and the alteration of the basis of wages would necessarily introduce an anomaly into rules respecting overtime, which would also require to be altered accordingly. Moreover, there is some anomaly in regard to method of procedure. The joiners' rules provide a method of procedure in cases of "disputes," as distinct from a question of alteration of rules, while the bricklayers' rules make no distinction. The joiners' rules provide for the relegation of an unsettled "dispute" to the "central authority of master and workman," and an unsettled point in regard to rules to an umpire, while the bricklayers' rules make a similar provision in regard to unsettled "disputes," but provide no special machinery for dealing with a question of rules, which presumably would come under the same category, although at previous meetings of trade committees an attempt has been made to apply a specific interpretation to the word "dispute." Since these sets of working rules were framed, the Conciliation Board rules have come into operation, and it now becomes necessary to consider what is precisely the machinery to be employed, and consider the advisability of introducing some uniformity between the working rules and those of the Conciliation Board. The matter now stands in abeyance pending a further meeting of the Trades Committees, when the whole matter will be considered *de novo*.

A report was presented embodying the replies of members in regard to the fixing of a uniform standard of profit of 2d. and 1½d. per hour respectively on tradesmen and labourers. The replies were unanimously in favour of the proposal. After some discussion it was decided to leave the matter over until next meeting.

The accounts in connection with the recent visit of Belgian builders were presented, and as far as was possible to make up at the moment, showed a total deficit of nearly £18. It was pointed out that several other gentlemen might yet subscribe, and, in fact, it was reported that some further contributions had been promised. Eventually it was decided to leave the matter over until next meeting, and Mr. Forsdike gave notice that he should then move that the deficit, if any, be then paid out of the funds of the association.

The secretary presented a rough printers' proof of the new telephone calendar for 1910. The design was more artistic than that of last year, the centre being occupied by an ornamental window giving a view in the distance of the tower of the Town Hall. The calendar would be finished in six or seven colours, and some additional space would be provided for advertisers.

A deputation from the Electric Supply Department of the Corporation waited on the association to discuss the apparent objection of builders to the installation of electric light fittings in houses of from £20 to £30 rental. With larger houses, the deputation pointed out, they had no difficulty, and in other cases the only difficulty seemed to be that an electric installation was not provided for, and the tenant could hardly be expected to "wire" the property. They wanted builders to assist them by "wiring" new property, which would not add more than 1 per cent. or 2 per cent. to the cost of a house, and then, with the new lamps, which so greatly reduced the cost of electric light, they were confident they would have no difficulty in

persuading the tenant to adopt the light. On the other side, it was pointed out that the extraordinary cheapness of gas in Sheffield militated against the general adoption of electric light, and builders did not feel justified in incurring the extra expense. The association were of opinion that if the Corporation wished to experiment in the direction indicated, they should pay for the installation, to which it was replied that some such system had been adopted at Wolverhampton, and if this was the only objection the Corporation might consider the advisability of obtaining powers, but they must first of all know that the prospective consumption would justify the expense. To this it was objected that the Corporation should first of all show prospective consumers the cheapness and all round advantages of electric light before they could hope to materially increase the number of consumers.

Mr. Biggin said it was a wrong assumption to say that builders objected to instal electric light on account of cost, which was less than fixing pipes for gas, but they could not afford to instal both. Moreover, many people had a strong prejudice against the use of electricity on account of the cost, and Mr. Roper said for the present they would still have to put in gas fittings.

Mr. Forsdike foreshadowed the time when electricity, which undoubtedly possessed many advantages, would become the principal illuminant, but if the Corporation wished to push the sale, they must hold out some inducement to builders on the lines indicated.

A most pleasant little ceremony concluded the meeting, when Mr. Biggin, on behalf of the association presented to Mr. A. Mastin (late honorary treasurer of the association) a beautiful carved oak Westminster clock, in recognition of the valuable services he had rendered to the association as treasurer for a period of ten years.

Mr. Forsdike said Mr. Mastin was undoubtedly their most enthusiastic member, and no man had done more to make the association a success.

Mr. Cook also spoke of the enthusiasm Mr. Mastin had put into his work. He had treated the association's affairs as his own, and lifted the funds from practically nothing to the prosperous condition in which they were to-day.

The president also spoke of the extremely valuable services Mr. Mastin had rendered to the association. Mr. Mastin was not present.

WARRINGTON AND DISTRICT ASSOCIATION.

Secretary: Bertram B. Moss.

Referring to the settlement of the joiners' and bricklayers' rules reported last week, the boundaries in both sets of rules have been very much extended, which is a great advantage to the employers. In addition to this, members of the association outside the actual town of Warrington have now been put on an equal footing with those employers actually in the town. Though both branches of operatives demanded an increase of wages, this was successfully resisted by the employers without any upset in the trade, and without the assistance of any conciliation board, as none has been formed in this district.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

A general quarterly meeting was held at the Old George Hotel on Thursday last, September 16th, when the Rt. Hon. the Lord Mayor (Alderman J. Birch) presided over a good attendance. The proposed form of sub-contract, as sent for perusal by the Yorkshire Federation, was discussed. Mr. R. Dent objected to the insertion of clause 3, which enabled a sub-contractor to break his contract on circumstances arising which could easily be merely the result of an oversight on the part of a contractor. The clause, if inserted, might cause endless difficulty, and appeared arbitrary. The sub-contractor had already power, under certain conditions, to break his contract, and in most cases this protection was ample. Mr. Councillor Hardgrave thought there were some things to be said in favour of the clause standing, as sub-contractors frequently suffered under existing conditions. The general opinion of the members, however, was in favour of Mr. Dent's objection. Mr. Councillor Hardgrave, with reference to clause 4, raised a question touching the position of a sub-contractor in the event of the whole contractor becoming bankrupt. It was suggested that the point might be raised by the local delegates to the Federation meeting. On a full discussion of the draft, it was unanimously resolved that, subject to clause 3 being struck out as unnecessary, the proposed form was approved.

Correspondence from insurance companies was read, and the rates and extent of cover were found satisfactory and approved.

The circular letter on the National reserve fund was read and discussed, and it was calculated that our proportion, based on our Federation subscription, would amount to about £5. Mr. Dent proposed, the chairman seconded, and it was carried, that that sum be accordingly sent to the treasurer of the fund as our subscription for the current year.

The question of a breach of rules was discussed, and full explanation was given. It was resolved that the operatives' secretary be written to and informed of what action had been taken, and its result.

The secretary reported that he had been successful in obtaining a rebate for the stonemason members on all memorials, of a certain size, which had been taken into the grounds of the York Cemetery Co. between January 15th and April 1st last, the fees for which had, on the first-named day, been raised, thus causing a loss on contracts (entered into by the local masons) based on the old scale of fees. The secretary's action was approved.

The recent leading article in the "Builders' Journal" on "Builders' Locked-up Capital," and subsequent correspondence thereon, were mentioned and discussed. Mr. Dent said it opened out an interesting and most serious subject. He thought 90 per cent. should be paid up on contracts monthly, with 5 per cent. on completion, leaving 5 per cent. only as retention money. Contractors were often subject to great inconvenience, whilst at the same time being subject to a lien on everything brought on to the job. In addition, there were bondsmen or deposits required, very often up to 25 per cent., and with all this as much as 20 per cent. was sometimes kept back as retention money. He thought provision should be made for 90 per cent. monthly in the agreements. So far as York was concerned, however, the matter did not cause ground for complaint. The members, after discussion, approved and expressed sympathy with the subject matter of the article, and decided that if the matter was brought up by the Federation at any time it would be supported by the local association.

A recommendation as to the provision of papers, lectures, etc., on various subjects interesting to the trade, was approved and referred to the executive to be dealt with. Further recommendations, relative to the encouragement of technical classes for students, and the holding of a whist drive or smoking concert, were also referred to the executive.

Midland Centre.

NOTTINGHAM ASSOCIATION.

Secretary: W. J. Barton, F.C.I.S.

The members of the Nottingham Association had their summer excursion on Friday, September 10th, when 41 members and friends attended. The spot selected was the Derwent Water Works, which the members visited three years ago. The works are being constructed by a Board, constituted by Act of Parliament, which consists of representatives of the Corporations of Sheffield, Nottingham, Leicester, and Derby. The works visited on this occasion were the filter beds at Bamford, and the Derwent and Howden dams. The visitors were much interested in the whole of the works, but especially in the cable ways and concrete mixer at the Howden dam, and also in the construction of the wing walls, which it has been found necessary to build at this dam. The route taken was by rail to Sheffield, thence by coach and fours over the Derbyshire Moors, via Fox House, Hathersage, to Bamford, where lunch was served at "The Marquis of Granby." Various works having been inspected, tea was taken at Ashopton Inn, and the return journey made by another route to Sheffield. The weather was fine, the scenery good, the business interest to builders and contractors exceptional, and these elements combined to make the excursion one of the most successful ever held by the association.

SCOTTISH BUILDING TRADES FEDERATION.

The fifteenth annual general meeting of the Scottish Building Trades Federation was held in the Caledonian Hotel, Inverness, on September 10th, at 3.45 p.m., Mr. James Leslie presiding.

Minutes of the annual general meeting held on September 18th, 1908, and minutes of the half-yearly meeting of the Executive held April 23rd, 1909, were read and adopted.

The report by the Executive for the past year, and the treasurer's report, were read and unanimously adopted, and the secretary was authorised to have them printed and issued to the members.

Reports on the state of trade that were submitted showed that dulness prevails throughout Scotland.

The secretary reported that the dispute between the Inverness Federation and a firm of plasterers in Aberdeen had been ended satisfactorily.

It was agreed that the secretary should represent the Federation at the Annual Conference of Secretaries, to be held in Leeds, on October 19th.

Recommendation by the Executive that the Federation should adopt a National crest was brought forward and unanimously agreed to, and the secretary was instructed to submit sketch for approval to Mr. Hector MacVinish (Inverness), Mr. T. C. Stocks (Dundee), Mr. David Mekie (Edinburgh), and Mr. James Leslie (Aberdeen).

The report by the Journal Committee of the National Federation was next considered, and resolutions were agreed to.

The secretary then gave a report on the working of the inter-trading rule. He stated that Aberdeen and Edinburgh alone had taken up the matter seriously, and he showed the benefits that had already accrued to the Edinburgh, Leith and District Building Trades Association since their adoption of the rule. He urged the other associations to take the matter up for consideration again.

It was reported that the Perth Building Trades Federation had not been reconstituted since the Federation meeting there in April last, but it was believed that during the coming winter the association would again be put on a proper footing.

The secretary reported the present position with Glasgow Employers' Council. He stated that the affiliated trades in Glasgow are masons, joiners, plumbers, and lathsplitters, and until the other trades joined the Council, Glasgow would not be ripe for federation.

The question of priced schedules being sent in along with tenders was next considered. It was pointed out that this was becoming a general practice, and, on the motion of Mr. Lyall, seconded by Mr. Lownie, the following resolution was unanimously adopted: "That each Federation and local association should, as a matter of principle, instruct their members to refrain from sending in priced schedules with tenders; but, if unable to avoid doing so, should endeavour to arrange locally with corporations, engineers, surveyors, architects, and other public bodies who at present insist upon having priced schedules with tenders, that such schedules should be delivered under seal, and that the schedule of the accepted tender only should be opened, and the others returned to the unsuccessful contractors."

Mr. John Lownie reported that in Edinburgh some architects had introduced an innovation in respect that they inserted jobbing rates in contract schedules. He gave instances where the rates allowed would not cover the cost of the material. The opinion was expressed that such a practice was directly opposed to fair dealing, and, on the motion of Mr. Lownie, seconded by Mr. Mekie, it was unanimously agreed that it be left to each contractor to state his own rates for jobbing work, or, alternatively, to state at what percentage below the local current price list for jobbing work he will do the work.

The chairman reported that while he had been north at Wick and Thurso, he had met several of the local members there, and he thought that their associations would join the Federation if approached. The secretary was instructed to write them on the subject.

The election of office-bearers was next proceeded with. On the motion of the chairman, Mr. Hector MacVinish, Inverness, was elected president for the ensuing year; Mr. David Mekie, Edinburgh, was elected vice-president; both elections were unanimous. Messrs. MacVinish and Mekie will act as representatives to the National Federation *ex officio*.

It was agreed, on the motion of Mr. Slater, seconded by Mr. Farquharson, that the next half-yearly meeting of the Executive be held in Dundee, in April, 1910.

The secretary drew attention to the fact that a good deal of legislation had been before the House of Commons recently, which affected the builders' interests, and suggested that a Parliamentary Committee be appointed to look after such matters in future.

The suggestion was cordially received, and, on the motion of Mr. Lownie, seconded by Mr. Gray, it was agreed to invite nominations for the committee at the next half-yearly meeting of the Executive.

The chairman, on behalf of the delegates present, thanked the members of the Inverness Building Trades Federation for their kindness and hospitality, and after votes of thanks to the chairman and secretary the meeting ended.—JAMES LESLIE, chairman; JAMES CAMERON, secretary, 61, Lothian Road, Edinburgh.

In the report by the executive of the Scottish Building Trades Federation, extreme regret was expressed that the trade throughout Scotland during the past twelve months has been in a bad state. The general trade of the country, however, has very much improved within recent months, and it is believed that an improvement will be felt in the building trade also during the coming year.

Nothing definite has evolved so far in connection with the proposed new scaffolding regulations. Pressure of Parliamentary business of a more important nature has resulted in the measure being left in abeyance. In order that the interests of the Federation may be properly safeguarded, Messrs. James Leslie and George Farquhar, of Aberdeen, with Mr. John Lownie, Edinburgh, have been appointed as a committee to interview the Home Secretary, if thought proper, when the Bill comes up for consideration.

The secretary has been in communication with the new secretary of the Glasgow Employers' Council, with a view to getting that body into the Federation, but matters are not yet ripe in Glasgow for such a step being taken. At present the trades represented in the Glasgow Employers' Council embrace masons, joiners, plumbers, and lathsplitters, but until the other trades come into line there is little prospect of the Council becoming federated with this Federation.

Notwithstanding the decision of the last general meeting not to send the secretary to the National Conference of Secretaries held in London on October 20th, he nevertheless attended the Conference at his own expense. He has been the sole representative from Scotland during the past four years; and as the chairman was in favour of the Federation being again represented at the last conference, the secretary advised the National secretary that he would be present as usual. The educative and instructive value of these conferences is undoubted, and a fillip might be given to organisation generally if each association would send its secretary to attend the next conference, which is to be held in Leeds on October 19th, 1909.

From inquiries made by the secretary, the inter-trading rule does not seem to have been taken up seriously by any of the associations, excepting Aberdeen and Edinburgh. In Aberdeen the plumbers and slaters have adopted the rule, while it has been in force

in Edinburgh for more than a year with gratifying results. The Executive trust that during the coming year efforts will be made to get the rule adopted by the several associations who have not yet given it a trial.

The adoption of a national crest for the use of the members of the federated associations has been considered. A sketch of the proposed crest has been prepared and submitted to the Executive, who have approved of it and recommended its adoption. If the recommendation is given effect to, it is hoped that every member will provide himself with a crest for use on his business stationery.

It is regrettable that so many of the federated associations have become moribund. With a view to stimulating interest the venue of the half-yearly Executive meeting was changed from Edinburgh to Perth, where the meeting was held in April last. The delegates present from the Perth Association undertook to have their association put on a proper footing again during the winter months, and asked that their association be retained meantime on the list of federated associations. To this request the Executive cordially agreed.

Considerable apathy seems to affect the districts of Dingwall, Dumfries, Alloa, Oban, Banffshire, and Paisley, probably due to the dull state of trade. The associations in these districts are regularly advised of all that is being done, in the hope that with a revival in trade they will be found back taking an active part in the work of the Federation.

There seems to be a growing practice amongst architects to insist on priced schedules being sent in with the tenders. Some action will need to be taken at once to check this tendency.

Another innovation by some architects is to insert jobbing rates in contract schedules. There have been some cases of this in the Edinburgh district during the past year. Representations were made to the proper quarter, but no redress was given, and the matter is about to be taken up with the Edinburgh Architectural Association.

The Executive regret to report that the seven associations in arrear with their subscriptions at the close of the last financial year, are still in arrear. This necessarily means a considerable loss to the Federation, but, notwithstanding, the finances have been well maintained, and there is a good balance in hand. With a revival in trade it is hoped and believed that those associations, once they get properly organised again, will be ready and willing to meet their liabilities.—JAMES LESLIE, chairman; JAMES CAMERON, secretary.

The Royal Liver new building at Liverpool is now sufficiently advanced to afford a good idea of its gigantic proportions; the granite work, for which the stone has been supplied by Messrs. A. and F. Manuelle, of 57, Gracechurch Street, E.C., now showing to the height of the seventh floor.

* * *

Messrs. Patman and Fotheringham, Ltd., Theobald's Road, London, W.C., are making extensive alterations (Mr. Eustace Haynes architect) to the premises of the General Electric Light Co., Ltd., of Queen Victoria Street, E.C.; and the same firm have also just secured the contract for re-building 220-222, Great Portland Street, W. (Mr. Claude W. Ferrier, architect), 11, Waterloo Place, W.).

* * *

The hall of the Cordwainers' Company, in Cannon Street, E.C., which was erected in 1788, is now in course of demolition. Three previous halls had stood upon the same site. The first was erected in 1440, following upon the granting of the guild's first charter by Henry VI.; the second, built in 1577, was destroyed in the Great Fire; and the third, erected in 1670, gave place to the hall which is now coming down, and which will be succeeded by a modern, up-to-date structure from the designs of Mr. Chatfeild Clarke. The building, which had no pretensions to architectural merit, contained little that was of architectural interest.

NEW MUNICIPAL WORKS.

The Local Government Board has decided to hold, or has recently held, as the dates respectively indicate, inquiries into proposed expenditure by public bodies as follows:—Water Supply Works and Plant: Totnes Rural District Council, £400 for Holne (September 23rd); Plympton St. Mary Rural District Council, £4,050 for Plympton St. Mary, and £1,350 for Plympton St. Maurice (September 22nd). Electric Light and Power Supply Works and Plant: Salford Borough Council, £9,500 (September 21st). Sewerage, Drainage, and Sewage Disposal Works and Plant: Llantrisant and Llantwit Tardre Rural District Council, £21,000 for Llantrisant (September 23rd); Headington Rural District Council, £4,263 for New Marston (September 21st); Whitby Rural District Council, £670 for Newholm with Dunsley (September 21st; Salford Borough Council, £30,788 (September 21st); Swansea Rural District Council, £3,900 for Gowerton special drainage district (September 21st). Street Improvement, New Roads, Widenings, Pavings, Public Walks, and Pleasure Grounds: Brighton Borough Council, £2,196 and £5,927 (September 29th); Hendon Urban District Council, £1,682 (September 28th); Topsham Parish Council, no amount stated (September 24th); Torquay Borough Council, £750 and £1,700 (September 24th); Southgate Urban District Council, £5,856 (September 23rd); Barking Town Urban District Council, £750 (September 22nd); Devonport Borough Council, £1,167 (September 21st). Various: Pontypridd Urban District Council, £620 for bridge (September 22nd); Ebbw Vale Urban District Council, £10,880 for housing (September 22nd).

"I.C.S." CELEBRATION DINNER

A dinner celebrating the 18th anniversary of the International Correspondence Schools was held at the Hotel Cecil on Saturday evening last, September 18th. Among the distinguished guests present were Sir Thomas Brooke-Hitching (in the chair), Mr. L. A. Atherley-Jones, K.C., M.P., Mr. A. S. E. Ackerman, B.Sc., secretary, Society of Engineers; Mr. Dennis Hird, Central Labour College, Oxford; Mr. Jas. Adamson, hon. secretary, Institute of Marine Engineers; Mr. T. Costigan, secretary, Institute of Builders; Sir Edward W. Fithian, secretary, Association of Chambers of Commerce of the U.K.; Mr. N. W. Hoskins, hon. secretary, Institute of Sanitary Engineers; Rt. Hon. Col. Mark Lockwood, P.C., M.P.; Col. S. S. Long, Asst. Director of Supplies, Woolwich; etc. At the conclusion of the dinner, the toast, "The King," having been honoured, Sir Thomas Brooke-Hitching, presiding in the unavoidable absence of Lord Montagu of Beaulieu, after paying a eulogistic tribute to the schools, proposed the toast, "The International Correspondence Schools," coupled with the name of Mr. E. A. Seitz, Managing Director of the Institution, who replied. Sir Thomas then proposed the toast, "Education for the Wage Earner," to which Mr. Dennis Hird, M.A., responded, "as one who came from the only democratic college in the Kingdom, owned and controlled by the people." The toast, "I.C.S. Students at Home and Abroad," was then proposed by Mr Atherley-Jones, K.C., M.P., who gave an eloquent vindication of the system adopted by the I.C.S.

Student W. G. Wilson, secretary of the Eccles Spinning and Manufacturing Co., replied. Mr. O. F. Odell, C.A., then proposed the toast, "The Guests," to which Col. S. S. Long responded on behalf of "The Army I.C.S. Students," Mr. J. M. Macdonald, of Messrs. S. Pearson and Son, Ltd., on behalf of "Employers of Labour" and Mr. Geoffrey Adam, in the absence of Mr. J T. Macpherson, M.P., on behalf of "Organised Labour." A musical entertainment, rendered by the I.C.S. Concert Party, brought to a conclusion a most enjoyable evening.

Trade and Craft.

Strand Hotel Sanitary Fittings.

We are informed that Messrs. Doulton and Co., Ltd., supplied the whole of the sanitary fittings in this hotel. A special feature is that a lavatory basin, fitted with hot and cold water, is fixed in each bedroom. These lavatory basins are in polished jaune Lamartine marble, with nickel plated legs, and nickel-plated towel rail, and fitted with glass shelf, etc., for towels. The baths are made of cast iron, white porcelain, enamelled inside and outside, with nickel plated hot and cold fittings. The w.c.'s are the pedestal type; the cistern, flush pipe, and pan are all in white glazed ware. The lavatories for public rooms are in Dove marble, with waste of special design, nickel plated. The ladies' and gentlemen's hairdressing rooms are sumptuously fitted with statuary marble lavatories, with special mixing valves fitted with hand-spray, etc. The urinals and the sinks are in Doulton's special white glazed Vulcanware.

Associated Portland Cement Manufacturers (1900), Ltd.

In the ninth annual report of this company, to be submitted to the tenth ordinary general meeting which is to be held to-morrow, September 23rd, at twelve o'clock noon, at Winchester House, Old Broad Street, E.C., it is recorded that the depression in the building and constructional trades referred to in the last report continued throughout the whole of the past year (the accounts are to June 30th, 1909). This has tended to reduce the demand for Portland cement, and has accentuated the fall in its price. In these conditions the results of the year's trading are considered satisfactory. It is stated that if the main factor which has enabled the company to earn approximately the same margin of profit on its output as heretofore, is the reduction in manufacturing cost brought about by a very considerable outlay of capital upon its principal works. The directors recommend that, as in previous years, a sum of £25,000 be carried to the general reserve and depreciation account, bringing that account to £195,000. The total charge for the year for sinking funds, depreciation, and reserve (including the amount written off patents and the reserve for bad and doubtful debts), will then amount to £61,065 13s. 8d. The profits, after deductions which include £105,737 for repairs and renewals, amount to £337,668, which, with the balance brought forward, amounts to £383,165. An interim dividend on the preference shares was paid on March 31st, and the directors recommend the payment of a final dividend at the rate of 5½ per cent. per annum.

The Cardiff and District Architects' Association were invited, on Friday last, by Messrs. Teather and Wilson, architects, of Cardiff, to view the armoured concrete floors which are now being constructed on the Coignet system at the Newport Road Intermediate School for Boys. The members present were taken over the work, and an explanation was given to them of the methods employed for the construction of floor slabs, beams, pillars and balconies. The contractors for the armoured concrete work are Messrs. Watt Bros., of Cardiff.

* * *

Four new serial issues, "Building Construction," "Carpentry and Joinery," "The Handyman's Enquire Within," and "Woodcarving" are being issued by Messrs. Cassell and Company, of La Belle Sauvage Yard, Ludgate Hill, E.C., each work in twenty-four threepenny weekly parts, commencing September 8th. Judging from the specimen copies that have been forwarded to us, these manuals seem to be admirably adapted for beginners and students, and their intrinsic value, as well as the method of publication, which places them within the means of the poorest pocket, render them a veritable godsend to the ambitious craftsman.

GOING THROUGH THE SAME OLD MOTIONS DAY BY DAY NEVER PUTS A MAN

one inch forward on the road to advancement and high pay. You must understand—thoroughly—exactly why you do thus and so in your particular work you must understand the reasons for the work you do—must understand the principles governing its theory as well as its practice.

These things you can never learn simply by doing the day's work. Yet here is the important point: while you have a job is the ideal time to master the "Reasons Why" of that job.

That is where the International Correspondence Schools scores its biggest success. . The I.C.S. was founded for the purpose of training men who are in work to know the technique and theory of the very work which they are doing. It is only the man who is thoroughly trained—who knows the reasons governing his work—who understands the science of the business he is in—who can ever hope to hold a superior position and to command the big pay which goes with it.

The I.C.S. absolutely furnishes this training. Let us send you positive proof in the form of letters from employers and successful I.C.S. students. To take an I.C.S. Course is surprisingly easy, both as to time and money required. This short list will give you an idea of the courses from which you can choose; say which you are most interested in:

Long Eaton.—For new streets, Long Eaton, for the Bonsall Street Land Society. Quantities by Walter H. Woods, M.S.I., Architect, High Street, Long Eaton, near Nottingham.

J. Hutchinson & Son, Leicester	£2,789	0	0
J. Hawley, Ilkeston	2,446	15	6
Perks and Son, Long Eaton	2,188	0	0
John Bull, Long Eaton	2,027	0	0
J. Thraves, Stapleford	2,022	0	0
C. E. Cox and Co., Ilkeston	1,949	5	8
Brown and Son,* Long Eaton	1,919	10	0
Belshaw and Son, Nottingham	1,877	0	0

*Accepted.

Oakfield, I. of W.—For erection of first part of St. John's parish hall, Oakfield. Mr. George Boughton, Architect, Ryde.

T. and E. W. Jenkins, Newport	£697	10	0
J. Newnham	674	10	0
A. P. Williams, Newport	670	0	0
J. Ball and Son, Cowes	£648	0	0
G. Gallienne	605	0	0
F. H. Holland	600	0	0
A. E. Hayden	598	10	0
Wheeler Bros.	597	10	0
J. Wheeler and Sons*	585	0	0
Adams and Mitchell, Haylands	547	18	0
J. Attrill, Sandown	516	12	0

Rest of Ryde.

*Accepted.

Pontywaun (Mon.).—Accepted for extensions and alterations to the county secondary school, for the Monmouthshire Education Committee. Mr. R. L. Roberts, Architect, Abercarn. Quantities by architect.

J. Pritchard, Pontymister, Mon., £1,385.

Saham Toney, Norfolk.—For erection of Saham Toney Hall, Norfolk. Mr. Herbert J. Green, A.R.I.B.A., Architect, Norwich and King's Lynn.

J. Thompson and Co., Peterborough	£10,122	15	5
G. Riches, Cromer	9,425	0	0
Cubitt and Gotts, Ipswich	8,795	0	5
J. Youngs and Son, Norwich	8,247	0	0
R. Shanks, Chatteris	8,054	0	0
J. Cracknell* Peterborough	7,964	0	0

*Conditionally accepted.

St. Paul's Cray.—For additions to Cray Valley Cottage Hospital. Mr. St. Pierre Harris, Architect, 8, Laurence Pountney Hill, E.C.

R. A. Lowe and Co.	£2,400
T. D. Graty	2,377
T. Rider and Son	2,276
T. Knight	2,209
W. Blay, Ltd.	2,175
H. Somerford and Son*	2,025

*Accepted.

Taunton.—For rebuilding the King's Arms, North Town, for Messrs. Starkey, Knight and Co., Ltd. Mr. G. C. Strawbridge, 25, Alma Street, Taunton, architect:—

Gleed Bros.	£1,259	0	0
F. W. Henderson	1,191	9	8
B. Way	995	5	0
F. Small	933	0	0
Vickery Bros.	849	17	6
Moggridge and Sons	849	15	0
J. Maddock,* Taunton	849	0	0

*Accepted.

Weaste, near Manchester.—For the erection of new Church of England Sunday Schools.

J. Bland and Son, Manchester	1,822
Clayton Bros., Poynton	1,805
J. Pennington, Bowden	1,800
Jas. Daniels and Son, Pendleton	1,769
Jas. F. Moore, Eccles	1,743
William Thorpe and Son,* Manchester	£1,735

*Accepted.

Wickford (Essex).—Accepted for detached cottage, Jersey Gardens, Wickford, Essex. Mr. J. Wornell, architect, The Land Co., 68, Cheapside, London, E.C.

Wm. H. Cuming, Hornsey Rise, £200.

Wigan. — Accepted for supply and fixing of switchboards and removal of existing direct-current switchboard at the electricity works, for the Corporation:—

British Thomson-Houston Co., £2,470.

Woolwich.—For erection of open-air wards at the Infirmary, Plumstead, for the Guardians of Woolwich Union. Messrs. Church, Quick and Whincop, William Street, Woolwich, architects:—

E. Mills, Westcombe Hill	£1,655	0	0
G. H. Gunning, Erith	1,596	0	0
T. N. Moss, Southend	1,546	17	6
E. Proctor, Plumstead	1,537	0	0
H. L. Holloway, Deptford	1,483	0	0
A. S. Douglass, Plumstead	1,480	11	0
Stephens and Son, Woolwich	1,419	0	0

LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION OF BUILDING TRADES EMPLOYERS.—Quarterly Meeting of Executive Board, Liverpool, 3 p.m.

Wednesday, September 29th.

LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION OF BUILDING TRADES EMPLOYERS.—Conference of Secretaries, Manchester.

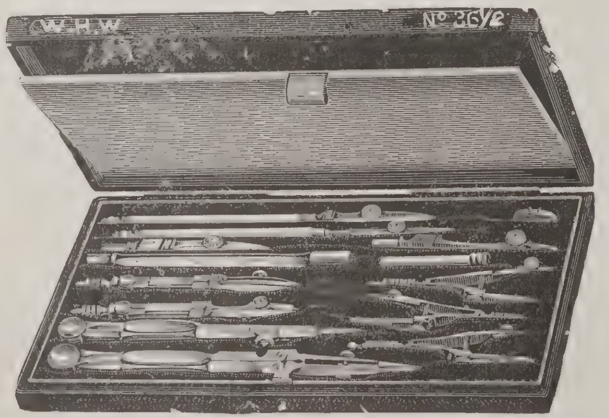
Tuesday October 12th.

NATIONAL FEDERATION OF MASTER BUILDERS.—Meeting of the Administrative Committee, at the London offices.

Tuesday, October 19th.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND.—Conference of Secretaries, Leeds.

The ARCHITECT'S CASE OF DRAWING INSTRUMENTS.



No. 36½.—Size 9 by 5½ in.

Special neat morocco leather case, silk lined, lift-up flap inside lid. Contains: 6-in. electrum steel-jointed sector-jointed compass, with two knee-joints, pen and pencil legs, lengthening bar, hollow bow pen and pencil. set of three spring bows, **hair-spring divider,** two ruling pens, and compass key.

Price **£2** each nett.

No. 37, same contents as No. 36 but extra quality, in handsome Russia leather case.

Price **£2 10s.** each nett.

The above case will be found to meet all requirements and the instruments are guaranteed to be of the best material and finish.
Money returned in full if goods prove unsatisfactory.

Contractual Referees.

Arbitration, or the settlement of disputed questions by a referee, has a well-recognised and important place in the social machinery of our time; so much so that if any business or professional man was asked to name the essential qualities of a referee he would probably say, first, that he should be "independent;" second, that he should be "impartial;" third, that he should be "expert" as to the subject matter of the arbitration. This being so, what must we think of the type of professional mind which can allow itself to be placed in the position of sole contractual referee under circumstances where "independence" is impossible by the very nature of the relationship of the referee to one of the parties to the contract, and "impartiality" out of the question as regards the relations of the referee to the other party. How can a professional man be "independent" of the client who employs him or of the Corporation whose servant he is, and how can he review "impartially" his own acts of omission or commission? We must suppose, however, that in some way professional gentlemen, like town clerks, and architects and engineers employed by Corporations, have convinced themselves that in spite of legal decisions to the contrary, in spite of the anomalous position in which they will be placed, it is their duty, the one to draw clauses in building contracts making the other sole arbitrator, and the other to undertake that function with sublime confidence in his own ability to rise superior to any personal considerations whatever; because several cases of this kind have recently come to our notice. Two are reported by the Yorkshire Federation of Builders in this issue (page 251), and another is being dealt with, we believe, in Lancashire, while a case (Blackwell and Co. v. The Mayor and Corporation of Derby) recently decided in the Court of Appeal before Lords Justices Moulton and Buckley turns on this same question of sole contractual referee. In the course of delivering judgment, Lord Justice Moulton said: Each case had to be raised on its facts. In his Lordship's opinion, where the nature of the dispute arising from the facts which were subsequent to the contract was such that the Court thought the arbitrator was not likely to be able to deal impartially with the dispute, it was open to the Court, and it was their duty, to refuse to enforce the arbitration clauses. In the present case the dispute was as to whether the engineer had not from the first acted unreasonably towards the contractor. Corporations were, in his Lordship's opinion, too fond of putting officers of their own in the position of arbitrators under a contract, and they forgot that as the officer had to perform other duties for the Corporation, there might arise conflicting interests between those duties and his duties under the contract, which might give rise to unfair treatment of the contractor by reason of the zeal with which the officer performed those other duties. In the present case he did not think the case ought to be tried by the engineer whose conduct was practically the sole point in dispute. Lord Justice Buckley concurred, and the appeal was allowed. In regard to the other two cases referred to, we want to draw attention to two points. The first is that in the Hull case, "the Hull Association considered that the sub-contractor had been harshly treated, but having regard to the expense of opening litigation with the Hull Corporation, especially as, by the contract agreement, the City architect was sole arbitrator, the contractors engaged on the work had agreed to share the loss in order that the retention money which had been outstanding for some time might be certified and paid." Here it is clear that *force majeure* prevailed simply because the sum involved was not large enough to provoke a contest, whereas in the Derby case it was. It is just cases like that which probably foster the practice complained of. There are many small oppressions which may be imposed without arousing a contesting hostility; but their aggregate may be quite sufficient to make it worth while to retain the system, and no doubt there are some other advantages from the engineer's point of view in having as free and uncontrolled a position as possible. The other point relates to an instance in which it is stated that "the architect, although a member of the R.I.B.A., used a contract form in which he was appointed sole arbitrator, and by which the contractor became responsible for the accuracy of the quantities." The surprising thing here is that a member of a body which issues a form of contract in which is a fair arbitration clause providing for an independent arbitrator, and a provision for the employment of a responsible quantity surveyor, should not invariably feel it incumbent upon him to adhere strictly to the implied policy of the institute to which he belongs. The matters to which we have referred show that there is room for a very useful reform if the question could be taken up in a friendly fashion by the ruling bodies of the professions and industry concerned, as far as voluntary organisations can control their members. Rules should be laid down and enforced by which professional men should be relieved from such false positions as those referred to, and contractors required to obtain the consent of their Associations at least before signing contracts where the architect or engineer under the contract is also the sole contractual referee.

Architectural Advice Gratis.

It is a far cry from Halifax in Yorkshire to Bombay in India, but these places happen at the moment to be (if the Hibernicism may be forgiven us) connected by two cuttings that lie before us. Halifax Corporation is revising its by-laws, and so is Bombay. In making the revision, Halifax has had the good sense to hearken unto the voice of the associated architects, and so has Bombay. In Halifax, the wisdom of the multitude of corporation councillors has been fortified not only by the collective intelligence of the architects but also by that of the Law Society and the Master Builders' Association. Then, with the aid of the Local Government Board, a new set of by-laws was drafted, and the draft was submitted to the Halifax Architectural Association for criticism. The Association found a few weak spots in the new code, interviewed the By-laws Committee of the Corporation, and obtained a promise that the points raised would be reconsidered. This seems to be quite the most sensible way of concocting by-laws; but a mercenary consideration here insists on intruding itself—ought not these experts to be paid for their skilled advice? But avaunt, Mammon! In Bombay, the advances came from the municipality, which asked the Association of Bombay Architects to send a representative to the meetings of the committee appointed to consider the re-drafted laws. Two members of the Association (one being its honorary secretary) attended sixteen committee and three sub-committee meetings, and most of the suggestions they made were adopted, and, at the close, the following letter was sent to the two architects by the Municipal Secretary: "I have the honour, by desire of the Building By-laws Committee of the Corporation of Bombay, to convey to you the committee's cordial thanks for taking part in their deliberations and for giving them the benefit of your advice." This is very grateful and comforting no doubt; but does it not seem to suggest that the architect is just a thought too unworldly, whether you find him in huckstering Halifax or in bartering Bombay? Of tougher fibre was the architect (in all probability apocryphal) of whom the ancient story is revived in last week's "Tatler." A past Bishop of London called in an eminent architect to advise as to alterations at Fulham Palace. The architect prepared his scheme, but the bishop, seeing that the cost was prohibitive, abandoned the project. "And now," said the bishop, "I shall be glad if you will tell me how much I shall pay you for your trouble in the matter."—"I thank your lordship. One hundred pounds."—"Why, sir," said the bishop, "many of my curates do not receive so much for a whole year's service." —"That may be true, my lord; but you will remember that I happen to be a bishop in my profession." The parallel suggests another: try to imagine a doctor or a lawyer being called in consultation by a public body and foregoing his fees! The thing is inconceivable—monstrous! Then why should architects be expected to give advice gratis?

The Victory of Abigail. A medical contemporary has just discovered that the basement house is obsolescent. It believes that "the day is already dawning in which the basement house will go to join the curfew bell, the dodo, and other relics of the past, in oblivion." We have no lingering doubts about the dodo, but the curfew bell gives us pause. We understand that its brazen tongue still speaks. So, we must admit does that of the area bell, although that and the curfew may appropriately compare their hard cases. It appears that, although a speaker at a recent congress ventured on the distinctly safe observation that "for the ideal city there will be no houses with basements, which help to spread disease, especially tuberculosis," our medical contemporary, with remarkable self-abasement, will not "claim for hygiene the chief word in the beneficent change which is taking place; for though its influence is all on the anti-basement side, the question has already been decided by the economic pressure of the domestic servant," who, "thinking more of her legs than of her lungs," sets her face against the basement, which for that reason is disappearing. Basement houses are avoided by Edwin and Angelina mainly, we suspect, because they look old-fashioned, and because of the untidy and insanitary litter that they harbour; to say nothing of the facilities they afford to "followers" and other undesirables. But they are almost past discussion. It is apparently only in the tall buildings of the United States that further basements are in contemplation; but they are another storey—or rather, several other storeys.

Ramsgate's Late Repentance. Ramsgate seems disposed to indulge in the amusing but not otherwise conspicuously profitable exercise of putting the cart before the horse. Certainly the late Colonel Hoe, who started working as a carpenter, and wound up by working (about ten times as hard) as a millionaire maker of printing machines, declared that one of his secrets of success was to refrain from getting in front of a load and trying to pull it; the more effective method being to get behind it and push it; but this system has obvious limitations, which the municipality of Ramsgate seem to have light-heartedly ignored. It is too much to expect the horse to push the cart. Yet, having built their schools, the Works Committee of Ramsgate Corporation proposed to engage an architect for them, as indicated in the following resolutions: "Resolved, that any complaints as to the manner in which the Lillian Road schools have been built be taken down in writing, and that the Council be recommended to engage a qualified architect, who shall not reside within a radius of fifty miles of Ramsgate, to give his opinion on the subject." The fifty-miles' limit is not the least curious feature of this remarkable resolution, especially in view of a further resolution, to the effect "that the request of the Borough Engineer to be relieved of his appointment for the new Lillian Road infants' school, to which he was appointed by the Council on the 6th May last, be accepted, and that the plans prepared by him be sent to the Board of Education for their approval, and that a local firm of architects be appointed to superintend and carry them out after approval by the Board of Education at a fixed scale of remuneration." This, as a councillor remarked in the discussion on the resolutions, is all very mystifying. "Surely," as another councillor remarked, "if an architect was required he should have been engaged before the schools were completed." Another councillor very justly deprecated any implied slight of the Engineer, "who had devoted hours of overtime in the endeavour to get the schools completed, and had saved the ratepayers something like £600 in fees, which the Council would have had to pay to an architect if one had been employed." Moreover, the proposal to call in the fifty-mile radius architects was actually passed before the Engineer had granted his final certificate; and all the alleged defects—which were merely hinted at in the debate, and would seem from that to have been quite small and ordinary—had since been remedied, and "not one single direct charge had been made to lead the Council to believe that the schools were not built properly." The councillors who had expressed dissatisfaction had given no reasons and made no direct charges. "There had been a lot of mysterious talk, but not one definite charge to lead the Council to believe that they had not received value for their money." If the matter is vague and mysterious to gentlemen on the spot, how much more so must it be to us who are so much beyond that fifty-mile radius? The gentleman who acted as spokesman for those who required the introduction of an alien architect after the job had been completed, himself confessed that the schools had been well and substantially built, so that one can hardly tell what he and his friends would be at. It is risky to attempt any sort of explanation of such recondite psychological phenomena; but we will hazard a guess that the Council, or certain units thereof, are suffering from the prickings of an uneasy conscience. Having saved £600 that ought to have been disbursed in architects' fees, they became anxious to make restitution by sending this conscience-money, or some of it, fifty miles away from Ramsgate. If they had succeeded in carrying their resolution (which was lost), one's rejoicing at so exhilarating an exhibition of poetic justice would have been switched off by the sudden recollection that it must involve a considerable measure of very prosaic injustice towards the Borough Engineer, whose zeal has been at any rate but ill-requited, and whose apparent desire to be relieved of his appointment with respect to the infants' school is, in the circumstances, quite natural; and this experience of the ingratitude of corporations should not be lost on other corporation officials who may be disposed or required to exclude the independent architect.

"Specification": New Edition. No. 12 of "Specification," being the edition for 1909-10, is now on sale, and is to be had at 6, Great New Street, E.C., price 3s. 6d. nett. It is somewhat less bulky than the preceding issue, and this is a distinct advantage. The volume had grown to unwieldy dimensions. In the course of revision, it was found that compression was not merely possible but desirable. This has been accomplished, not by the crude method of ruthless excision, but by resorting to greater intensification, a more thorough digestion of the multitudinous data, which are now set forth with greater clearness and conciseness.

"Specification" is now so widely known as hardly to need introduction or description. At the outset, the aim was to relieve professional men of the laborious and often futile task of consulting a whole library (of indefinite limits and incomplete scope) of technological books in search of the data necessary in the preparation of drawings, specifications, and bills of quantities. This object was so satisfactorily fulfilled, that "Specification" was immediately recognised as an invaluable and an indispensable guide to a vitally important department of professional practice; and its utility has increased with each succeeding issue, until it may now be regarded as a complete compendium of the essential items of a sound specification in every department that can be legitimately included within its scope. It is valuable alike to architects, surveyors, and municipal engineers, and provides a more comprehensive and compact mass of practical memoranda than, it is confidently believed, can anywhere else be found collected in one volume; and, by means of a copious analytical index, any required item can be found instantly, which is an inestimable boon to a busy man. This comprehensivesness has a threefold advantage. It prevents, as we have said, harassing research for items that are perhaps scattered over a dozen volumes, in which they may possibly lurk obscurely and evasively, and that, when at last discovered, are often hopelessly out of date; it tells the professional man all that he wants to know in his own department—not always, it is true, imparting instruction, but often, quite as usefully, refreshing the memory or confirming an impression—and it gives him, in matters that are outside his own particular line, an interesting general survey that conduces to intelligent comprehension and efficient co-operation. Above all, it offers the advantage that it is not a mere text book, which may or may not be in sufficient demand to warrant revision at irregular intervals. "Specification" is actually a periodical, issued annually, and its contents are kept fresh and up-to-date by constant revision, and any suggestions for its improvement are always thankfully received and carefully considered.

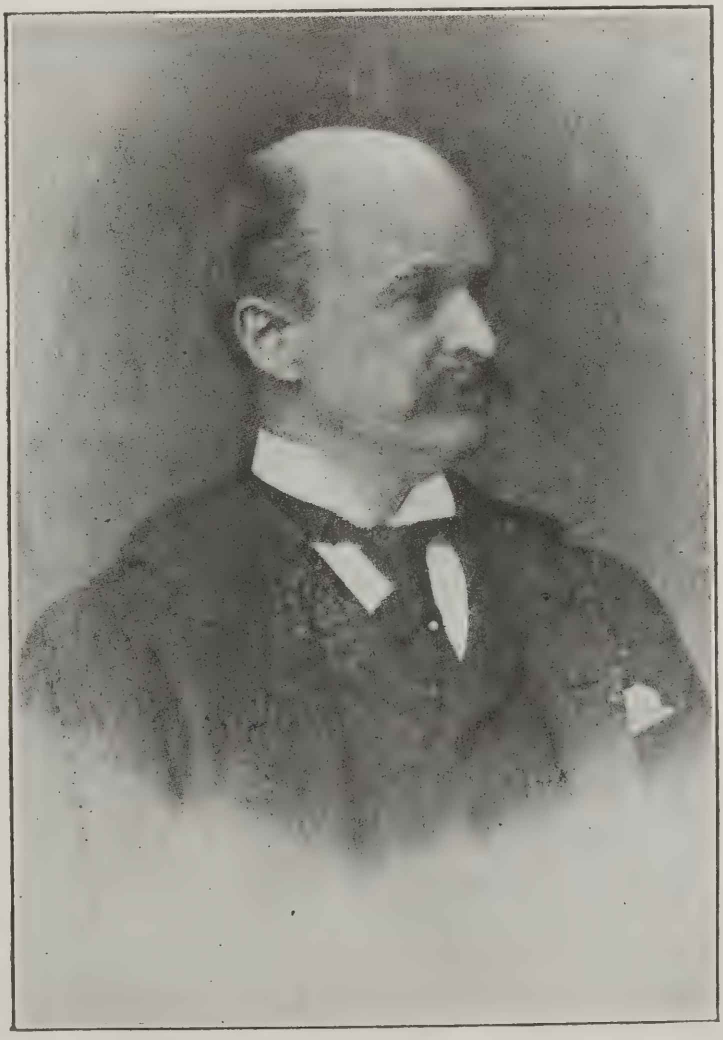
CHARLES FOLLEN McKIM: AN APPRECIATION.

The death of Charles Follen McKim, which, as recorded in our last week's issue, occurred on September 14th, is a distinct loss to the world of Art. He was unquestionably an artist. Born in Chester County, Pennsylvania, on August 24th, 1847, he was educated in the Scientific School of Harvard University, where, when about twenty years old, he took his degree. For the next three years or so he was in Paris, studying in the Ecole des Beaux-Arts and in the Atelier Daumet. Then returning to America, he entered the office of a New York architect, where he met young Mead, who, in 1880, when Stanford White returned from Europe, formed the second name in the now world-famous triple partnership of McKim, Mead, and White.

The work of the firm of which Dr. McKim was senior partner has perhaps exceeded in volume, variety, and aggregate cost, that of any other architect or firm of architects of any era. It includes, as stated by the writer of an important biographical article that is in preparation for the forthcoming issue of the "Architectural Review," from which we are at liberty to quote, "every class of building, in extent, from the tiny bungalow of the late Mme. Modjeska in California, to the vast pile of buildings for the New York station; in style from the rugged and picturesque Casino at Narragansett Pier to the grave and stately library of Columbia University; as to use, from the gates of Harvard University to the skyscraping new municipal offices of the city of New York." Among university buildings the firm's commissions included Virginia, Columbia, New York, with gates and buildings at Harvard, some of the buildings at Brown and Cornell; among libraries, that at Boston, which is one of the best of their earlier designs; of clubs, the University, Metropolitan, Harvard, Lamb's, Freundschaft, and Century in New York, the Mount Royal at Montreal, and the Algonquin at Boston; of Museums, the Brooklyn Arts and Science, the Walker Art Museum at Bowdoin College, Maine; of Government buildings, the new New York Post-office, the War College, the interior designs of the Executive Mansion at Washington, the Rhode Island State Capitol at Providence. The firm built the Nangatuck High School, the Madison Square Garden structures, Boston Symphony Music Hall, the Washington Arch, the New York monuments to Farragut, Cooper, and Hale, the Chicago monuments to Logan and Lincoln, the Battle monument and Cullom Hall at West Point; churches at Stockbridge (Mass.), Nangatuck, Rhode Island, Chattanooga, Tennessee, Morristown; and the Judson Memorial Church and Dr. Parkhurst's church in New York. From an enormous list, only some of the more prominent buildings can be mentioned here. They comprise two of the best buildings at the 1893 Columbian Exhibition of Chicago, namely, the Agricultural Palace, and the New York State building. Their domestic work comprises almost countless residences, among which may be mentioned the Villard, Robb, Morton, Vanderbilt, and Tiffany houses at New York, many town houses at Buffalo, Chicago, Boston, and Washington; and almost countless country houses, notable among which are the houses of Mrs. Elliot F. Shepard at Scarborough (N.Y.), of Mrs. Herman Oelrichs and Mr. E. D. Morgan at Newport (Rhode Island), of Mrs. Clarence Mackay at Roslyn (N.Y.), of Mr. Frederick Vanderbilt at Hyde Park (N.Y.), and of Mr. Ogden Mills at Staatsbury (N.Y.)—all of which might be not inaptly described as palaces. The firm's business buildings and hotels are also legion, and only a few of them can be named, such as the original Imperial Hotel, the Savoy, and the Yosemite Apartment House in New York; offices of the New York Life Insurance Company in New York, Kansas City, and Omaha; the Goelet and Warren buildings, the Tiffany and Gorham shops, and the "New York Herald" and "Judge" buildings in New York; the great Niagara power-house at Niagara Falls (N.Y.), the printing house of the "Cosmopolitan" at Irvington on the Hudson; the Cable building and the huge Sherry's Restaurant at Forty-fourth Street and Fifth Avenue, New York; the Girard Trust Company's bank at Philadelphia; the State Savings Bank at Detroit; the Bank of Montreal in Canada; the National City Bank, the Bowery Savings Bank, and the two buildings of the Knickerbocher Trust Company, one in Wall Street and the other in Fifth Avenue, New York. This catalogue, in its bare enumeration of big buildings of varied character, suggests amazing versatility and resource; and those who have seen the buildings themselves, or merely illustrations of them, admit that in this vast mass of work there is much that is noble, dignified, and truly artistic. The earlier efforts of the firm seem to be based on Hunt and Richardson. Later, Renaissance models were followed, but not slavishly; for, as a writer during that phase observed: "Whatever criticism has been made at length on the use of precedent in their buildings separately considered, it must be acknowledged that the firm of McKim, Mead, and White have always possessed an exact estimate of the value of ancient forms as stimulants to the imagination. Theirs is a method of selection—a choosing of the beautiful and useful, a rejecting of the inartistic and commonplace of former architectures. It is not, as some would suggest, a blind groping after an harmonious effect, but it is marked by the scientific element which distinguishes the artist from the artisan. They seem able 'out of a senseless Nothing to evoke a conscious Something.' Their adaptations have taught them, in their maturer work to add soul and grace to purely modern products."

For much of the merit of these works Mr. McKim must receive the credit. It was he who drew the attention of America to the riches of European architecture, by adapting foreign successes to American needs, especially in the application of Classic and Renaissance design to modern problems. A true patriot, like his father before him—James Miller McKim was an anti-slavery leader—he was above all a true artist. By adopting mural decoration for the halls of Boston Public Library, he may be said to have introduced it to America, and to have made for Sargent, Abbey, and Puvis de Chavannes the opportunities which they have known so well how to make use. He had a fine and true taste in sculpture as well as in painting, and he gave splendid employment to the talent of the sculptor Augustus St. Gaudens, a friend from student days. He gave many opportunities also to Martiny and McMonnies. The beautiful Bacchante, which is now the envied possession of the New York Metropolitan Museum of Art, was commissioned to McMonnies by McKim for the Boston Library, which lost it in consequence of an absurdly prudish objection to the nude by a puritanically prejudiced section of the community. The French Government ordered a replica of this statue for the Luxembourg.

It would not be correct to ascribe to Mr. McKim solely any of the work of the firm. It is safe to say, however, that none of the work ever went through the office without the benefit of his criticism and advice; but, of course, the other partners are to be reckoned with. When Mr. White died, his admirers were disposed to insinuate that the artistic spirit of the firm died with him; but since his death the work of McKim, Mead, and White has undergone no perceptible change of character! and, in fact, the partners worked so beautifully together, and saw things from so similar a standpoint,



CHARLES FOLLEN McKIM.

COLUMBIA UNIVERSITY LIBRARY. McKIM, MEAD, AND WHITE, ARCHITECTS.

that so long as Mr. Mead remains the good work will go on. If it be asked, who took the lead? the answer is, sometimes one, sometimes another; but if there was one who had the final determining word, whose judgment was deferred to by his associates, that one was assuredly Charles Follen McKim.

Mr. Francis S. Swales, from whose memoir for the forthcoming issue of the "Architectural Review" we have been permitted to extract the essence of this appreciation, concludes with the following tribute to the man he was privileged to know: "McKim's life was a full and busy one. Work, honours, distinctions, were crowded upon him; he was not less distinguished as a patron of art, connoisseur, and clubman, than as an architect. He was a friend and patron of Columbia University, and a founder of the American School at Rome. As a benefactor of art in the most material way he took a leading part, and deserved the greatest praise for what he accomplished.

R.I.B.A. EXAMINATIONS AND RECENT MODIFICATIONS.—III.

(*Continued from page 220, No. 763.*)

Subject V.—Specifications, Estimating and Professional Practice.

In this subject a knowledge of office routine and methods is of far more importance than the study of text-books, though something may be done by the latter. Our advice to such candidates as are still assistants is not to be contented merely to do that part of the office work which is allotted to them, but to study at every opportunity the conduct of every "job" from start to finish. The "special" candidate should not need any particular study for this subject if his practice is of a varied nature, but he should note the fact that questions often involve a detailed knowledge of special trades, and nearly always necessitate a sound and clear knowledge of practical construction and of materials old and new.

Section VI.—Construction (General).

Here it was necessary to answer four out of five questions, and the compulsory question was not quite of the usual type, perhaps, but still involved, as is usual in this question, a somewhat advanced knowledge of modern foundation construction, added, in this case, to a practical acquaintance with modern requirements in town buildings.

A note of warning may be usefully given. It is not sufficient to merely make your foundations and walls strong and secure: you must at the same time bear in mind the purse of your imaginary client. Economy is often as important as strength in construction, even in an examination question.

Lack of sufficient speed in working is, perhaps, the most frequent cause of failure. In this instance many candidates became engrossed in the first question to such an extent that justice could not be done to the remainder of the paper. This should be guarded against most carefully. Remember that it is not necessary to make complete or finished drawings, but only to display to the examiner your knowledge of the requirements. Avoid all repetition and concentrate your attention upon the salient features of the problem: allot a certain proportion of time to it, you can return to it if time permits at the end. It is to be noticed that the questions are generally not such as can be obtained direct from a text-book; practical knowledge is essential. As a rule the most important part of a constructive problem is in the jointing of the various parts, and this must usually be most clearly shown.

Section VII.—Construction in Iron and Steel Shoring, etc.

Though still urging the importance of observation, and taking illustrative notes of interesting pieces of practical construction in steel and iron, we believe that in this subject the knowledge obtained from text-books is of greater importance than in any other. We are here dependant upon theory to a great extent, and in so far as this point is important, we may refer our readers to the remark made upon subject V. in the Intermediate examination, as they apply in this case for the most part.

The paper set this time differs but little from previous papers except that perhaps the knowledge required is a little wider and less stereotyped, and the questions, as they have for some time tended to be, a little more complex. The shoring questions numbers 3 and 4 alone, perhaps, hardly illustrate the truth of this statement. Both could be readily answered from the illustrations in "Stock's Shoring and Underpinning." The mechanics of shoring is, as usual, not touched upon.

Even in this subject there is a great advantage in ready and quick sketching, and in both construction subjects the style of sketching is of some importance; it should never be laboured, and should in all cases be practical. It is generally left to the candidate to choose his methods of calculation, but probably the advice given to Intermediate candidates as to the choice of formulæ may be safely given here. The additional knowledge required in the Final mainly consists in such as can be obtained most readily by reference to the steel manufacturers' booklets, and the habit of observing the naked steelwork which abounds in all large cities, especially when in course of erection.

We cannot complete our remarks more appropriately than by urging the point emphasised in the advice to candidates given in the Kalendar, viz., at all times to carry a note book, and whenever an interesting point, whether æsthetic or constructive, is observed, to make a sketch.

BOSTON PUBLIC LIBRARY. McKIM, MEAD, AND WHITE, ARCHITECTS.

ELECTRICAL HOUSE WIRING: SOME RECENT DEVELOPMENTS, WITH A GLANCE AT FIRE INTERESTS.

A Rapid Change.

During the last two or three years the whole aspect of electric lighting as applied to interiors has undergone considerable changes. Progress has been rapid in many directions, and the general result has been to cheapen the cost of electric light and to bring it within the reach of many who previously could not afford its advantages.

Cheaper Light.

The principal improvements, taking them in chronological order, are the applications of the science of illuminating, engineering, the invention of metallic filament lamps, and the designing of new wiring systems. With the two first it is not now proposed to deal, except to note in passing that their effect to the consumer has been largely to reduce the cost of current, whilst providing a more pleasing form of illumination. To the electricity supply authority, on the other hand, they imply reduced revenue. In searching for fresh consumers to balance the losses, it became evident that there were many who could afford to pay for electric light, now that it is as cheap as gas, but who were still debarred from its benefits owing to the high cost of installing the wiring. This at once created a demand for a less expensive method of wiring—a demand which had always been dormant, but which could not previously be met owing to prohibitive rules.

New System of Wiring.

The electricity supply authorities having, however, relaxed their conditions from sheer necessity, new systems of wiring have recently been made available, by which the first cost of installing is reduced by a relatively large amount, so that the prospective small consumer is now in a position to obtain, and maintain, what was previously a luxury. It is proposed to describe briefly in these notes the more important of these new systems.

Wood Casings Obsolescent.

Formally, wiring was carried out mainly by laying the insulated wires in wood casings, or by running them through steel barrel, or by a combination of both methods. Wood casing is unsuitable for concealing beneath the plaster, as it affords little mechanical protection to the wires, and also because it necessitates too much cutting away and making good; therefore, it had to be run on the surface, and, if properly run; involved considerable expense,—this qualification including good joinery and æsthetic arrangement. Otherwise, there is little to complain of in regard to the wood casing method.

Steel Barrel,

on the other hand, has been proved, after many years, to have certain disadvantages, apart from the expense involved if this system is erected properly. The ordinary thin slip-joint tubes corrode in time, and also do not provide for an efficient electrical continuity (so important a factor of safety), in spite of the many continuity grips, etc., that have been devised. Heavy screwed barrel, however, whilst not deficient in electrical continuity, is expensive, and involves the use of expensive fittings; and in steel barrel of any kind, water, from moisture condensed from the atmosphere, collects, and in time rots the insulation of the wires.

The "Kalkos" Conduit System.

For those who can afford to pay for a conduit system, that known as "Kalkos" is excellent. In this system the barrel is of tinned brass, light gauge, and all the fittings are of the same material. Brass, by reason of its better heat-conductivity, combined (in this case) with the small amount of metal employed, does not condense moisture from the atmosphere, and, in consequence, the insulation of the wires does not perish. In addition, efficient electrical continuity is obtained by applying a stick of solder and a blow-pipe flame to every joint during the erection of the system, so that all the joints are soldered.

The Fire Offices and a Continental System.

In regard to cheaper systems, however, there was one which has been in use on the Continent for many years, but was not approved by the fire offices and other authorities in this country—namely, the Surface Flexible system. This consists essentially of heavily insulated twisted flexible wires, secured to insulators fixed on the walls and ceilings. The attitude of the fire offices was anomalous, because they permitted much smaller flexible wires to trail along the floor from wall plugs, where they could be trodden on at any time; and besides, there is much less danger, in case of a fault, if the wires are in full view and accessible. Another anomaly is that small flexible cords are permitted to take the weight of electrical light fittings. In Germany this is not permissible, a steel wire being employed in addition, for the purpose. The real objections to the Surface Flexible system are that the wires are unsightly, deposit dirt on the walls and ceilings owing to electrostatic action, and have to be pulled down in case of re-decoration. But these objections are of small account to the class of consumer whose custom was required by the electricity supply authorities. Several of the latter, and also some fire offices, will now pass this system, and it is also permitted by the wiring rules of the Institution of Electrical Engineers.

The "Facile" Lead Wiring System.

A system that involves very little new in principle, but only in detail, is that known as the "Facile" lead wiring system. It consists essentially of joint boxes and accessories of special design, by which lead-covered wires

TIFFANY HOUSE, NEW YORK. McKIM, MEAD, AND WHITE, ARCHITECTS.

RHODE ISLAND STATE HOUSE, PROVIDENCE, RHODE ISLAND. McKIM, MEAD, AND WHITE, ARCHITECTS.

(twin and triple) may be run in an economical manner. Such wiring is not new, and has been used in the past to a large extent, but formerly there was no proper provision for earthing the lead, and looping had to be employed at considerable expense. In the "Facile" system, china joint boxes are employed and arranged in such a manner that one box is required for each light point separately controlled, and for each group of lights controlled by one or two switches. Starting from the fuse board, each circuit consists of a twin wire, which runs to the nearest joint-box and then from box to box up to the full number of points in the circuit. A twin wire is run from each box to the light point, and another to the switch point. All wires entering a joint box have their lead sheathings connected by means of an "earth plate," and a similar plate is situate in the fuse-board, which is connected by a wire to an "earth clip" on the lead sheathing of the mains. The other end of the mains is connected in a similar manner to the nearest water pipe. The lead sheathings are all soldered to the earth plates or clips. When the wires are run under floors with the joists, they are fixed with saddles at the centre line of the joists, but where run across joists, a hole is bored on the centre line and the wires drawn through. The joint boxes are fixed to the joists by an ample plate midway between ceilings and floors.

When the wires are run on brick walls below the plaster, the brickwork is chased just enough to take the wires, a flat compounded tape is laid over the latter, and the whole is then covered with a hoop iron strip, 2ins. wide, which is fixed by nails driven into the joints in the brickwork at the edges of the iron. Thus the wires are well preserved from mechanical damage. It is claimed for this system that damp and condensation do not affect the wires and that perforation of the lead sheathing is prevented by efficient earthing. Also that the labour for fixing is low, and that when erected, it costs less than any tube system. No doubt it is an advantage to be able to use all the standard accessories on the market, such as switches, ceiling roses, etc. It would seem, however, considering the system as a whole, that whilst costing less, erected, than a tube system, it is more suitable for large buildings in course of erection than for existing small houses.

The Greenfield Flexible Wiring System.

Another system, which has not quite the same limitations, is that known as the Greenfield Flexible Wiring system, and emanating from America. Here, single, twin, or triple insulated conductors are armoured with flexible galvanised steel tubing, after the style of flexible metallic gas or steam pipes. The wires may be plain or lead covered. Various fittings are provided for joints, switches, etc. The tubing is made in two qualities, the less flexible for use in fireproof structures or for burying in concrete, and for drawing the wires through afterwards, the more flexible with threaded wires, for wiring existing buildings. It is claimed for the system that it is superior in mechanical strength to gas-barrel of equal internal diameter, and reduces the total cost of wiring on account of saving in labour and in bends and elbows.

The Simplex Flexible System.

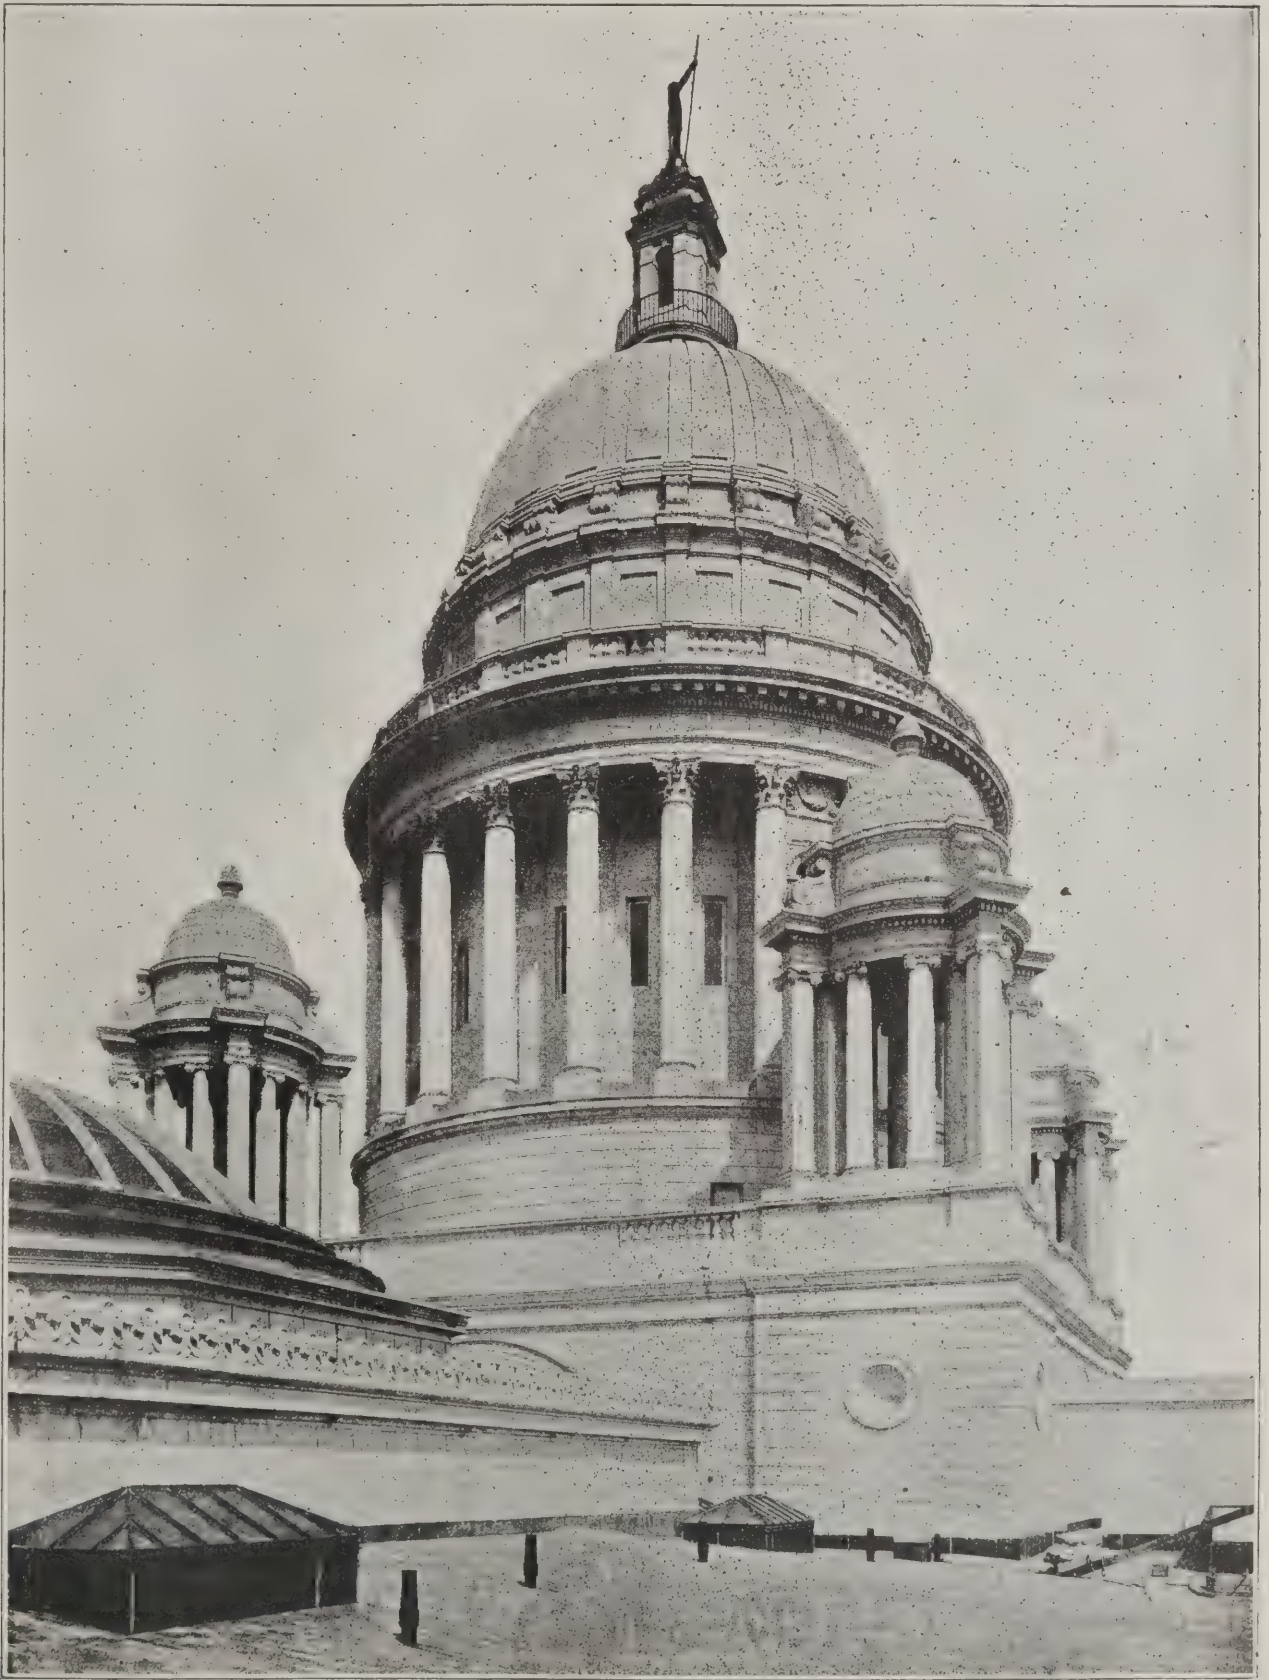
is another method for securing cheaper wiring. It consists essentially of twin small strand copper conductors, insulated with pure rubber and cotton, made up circular and armoured with small tinned iron wires. The armouring may be replaced by flame-proof or ordinary cotton covering combined with weather-proof material. The flame-proof quality may be painted after erection, and is not damaged by lime wash. These wires are for surface wiring only, and they are secured to walls and ceilings by means of spring clips on the principal of those used for billiard cues. Iron boxes are necessary for switches, ceiling roses, joints, etc., and "grip-nipples" are supplied for holding the wires where they enter the boxes. China interiors are employed for the latter for jointing purposes. It is claimed for the Simplex system that it has complete electrical continuity (the armoured type only) and flexibility, no condensation troubles, only one size of wire, readily removed, and therefore eminently suitable for temporary work, and low installation cost. Certainly the system must be cheaper in material and erection than those already described, and therefore meets the demand for inexpensive wiring in tenements, etc., where it is not necessary to combine economy with æsthetics.

The "O.S," Wiring System.

The last system to be discussed is that known as the O.S. wiring system. In this, so-called "Metacase" conductors are used, with or without Kalkos conduits (already described), according to the nature of the installation and the amount of expense that can be incurred on it. For the purpose in question, namely, an inexpensive installation, "Metacase" conductors alone are employed. These conductors consist of insulated copper wires surrounded by a tightly compressed sheathing of metal. The cheapest kind, namely, "Kuhlos" wire, is sheathed with brass with a mechanically joined seam, and is only slightly flexible, in that it cannot be bent too sharply. It is suitable for running on the surface only in dry interiors. "Stannos" wire is slightly more expensive; it is sheathed with tinned copper, with a soldered joint, and is watertight, and can be bent to quite small radii. It may be used in any position. These "Metacase" conductors do not require any joint or point boxes. All that is necessary is a metal backplate, with one of two kinds of clamps, for bringing in the wires from the side or back (as the case may be), and thereby establishing electrical continuity. These plates are fitted under wood blocks, on which may be mounted any of the ordinary accessories on the market. Continuity bus-bars are fitted in fuse boxes for the same purpose. These small fittings are very inexpensive. The conductors are fixed on the surface by means of very neat clips, which are bent over the wires by hand, and are almost invisible. It is claimed for "Metacase" conductors that, when erected, they form the cheapest, neatest and most reliable of all wiring systems. It is certain that they are extremely neat, being smaller in diameter than any other sheathed wires; they require a minimum of cutting away of joists, and when concealed wiring is employed, the plaster has only to be chased to the thickness of the wires, which does not necessitate touching the brickwork. If a private generating plant is available, or alternating current from the mains with a double-wound transformer, "Stannos" wires can be installed on the concentric system, the return current going through the sheathing. This implies using half the amount of wire, and under these conditions it is said that the wiring may be done reliably, including switches, lampholders, ordinary lamps and shades, for 10s. a point.

To Architects and Builders.

The systems described should be of considerable interest to architects and builders. To the former, as enabling them to arrange for wiring with a minimum of disturbance to the buildings, from both the structural and the artistic points of view. To the latter, as providing a less expensive means of installing the electric light, and so adding to the attractions of the smaller class of house property, which up to the present have had to be carcased for gas.



DOME OF THE RHODE ISLAND STATE HOUSE. McKIM, MEAD, AND WHITE, ARCHITECTS.

Our Plate.

House at Knaresborough.

This house has been erected on a site of about two acres, facing due south, together with stabling, coachman's cottage, conservatory, greenhouse, etc.

It is faced externally with Scotton stone, finely hammer scappled in irregular courses in thickness varying from 3ins. to 10ins., with larger quoins to the external angles, similarly dressed. The windows have stone mullions, glazed with lead lights, and fitted with Hope's iron casements.

The roof is covered with green Westmorland slates.

The open porch is of pitch pine, with seats on each side, the woodwork being treated with light coloured Solignum. The woodwork of dining-room is finished throughout with oak panelling, having waxed floor, panelled walls, fireplace ingle recess, with cupboards, shelves, etc., Well Fire Company's grate, plaster ceiling, with oak beams, etc.

The drawing-room has panelled walls and china cupboards each side of fireplace recess, also on the flank of wall near doorway. The fireplace has open dog grate in recess of Pilkington's hand-painted tiles, with Pewtal hood of ornamental design, and coloured enamels by Messrs. Spittle.

The central feature of the fireplace is a beautifully modelled plaster panel by Miss Frances Darlington of a subject taken from Omar Khayyam, the woodwork being treated throughout with white enamel.

The hall has marble floor, oak doors, with upper panels glazed. The decorative glass throughout, including a large staircase window, was designed and executed by Mr. George Walton.

The house has three reception and five bedrooms, with usual offices.

The conservatory adjoins the drawing-room with a glazed lobby, giving access to the garden or conservatory. This meets the objection somewhat of direct access to the conservatory or garden from a drawing-room, reducing to a minimum the objection to dampness and dirt.

The gardens are laid out formally, with the object of simplicity and breadth, from a design by the architect. There is a rose garden rising above the entrance court with good sized beds on each side of a central pergola terminated at one end by a flight of steps, with a sundial in the court, and at the other end with a seat. From the garden, by another flight of steps, the terrace level at front of the house is reached. Here are wide herbaceous borders, backed by a clipped beech hedge, enclosing a sunk garden and parterre centreing with a vista from the side windows of the dining-room. Beyond are a summer-house and a fair-sized rock garden, richly planted with a choice collection of Alpine and other suitable plants.

The whole of the formation and planting of the gardens was carried out by Messrs. Backhouse and Company, of York, who have supplied a very choice collection of hardy plants, many of which are seldom seen in most gardens.

There is also a bowling alley on each side with wide herbaceous border running parallel with the south front of the house, and at the right angles to the carriage drive.

The contractors were as follows :—Masons, etc., J. Simpson and Sons; Joiners, etc., J. Checkley; plumber, W. Bellerby; plasterers, Fortune and Calvesley; all of Harrogate; slater, W. Atkinson, Leeds; painter, M. Wood, Knaresborough; heating, etc., England and Robinson, Harrogate.

The whole of the works were carried out from the designs of Mr. Arthur A. Gibson, architect, 5, Prospect Crescent, Harrogate, and under his superintendence.

Eagle House, Mitcham.

The measured drawings of details from this fine old Georgian house show details of cornice, key truss to arch, archivolt, plaster cap, necking, and base. The elevation, and other details, have been already published in former issues of this journal. The work was measured by Joseph Seddon and L. F. Jones, and drawn by Joseph Seddon.

The western towers and spires of Truro Cathedral are rapidly approaching completion. The design, which has been somewhat modified in order to provide for a peal of bells in the north-western tower, is Early English, and the total height of the towers is about 200ft. The spires are alike in general design, though varied in detail, with open angle turrets and spire lights. The Cathedral School, begun a year ago, is practically ready for occupation. It has been designed to harmonise with the Cathedral and its surroundings, and when the cloisters, included in the plans, are built, the school will have a covered way into the church.

A PURELY PRACTICAL FIRE TEST.

Another striking example of the fire-resisting properties of concrete is at hand to substantiate the remarkable record of this material as shown by the conflagrations at Baltimore and San Francisco and recent fires in New York and Dayton. On this occasion the structure, which was subjected to a severe and practical test, an actual fire, was a reinforced concrete building, comprising part of the plant of F. W. Tunnell and Co., manufacturers of glue, at Wheatsheaf Lane and Gaul Street, Frankford, Philadelphia. Their building was tested from within and without by a fire so hot that wire-glass window panes were melted in their metal frames. In view of the attitude of some insurance companies on the subject of concrete building risks, it is interesting, if not amusing, to state, that the insurance experts called in to adjust claims had luncheon served to them in this concrete building, upon which no insurance was carried, while they estimated the loss sustained by the destruction of the surrounding buildings. What may be their views at present has not been ascertained.

The building was erected in 1906 by Ballinger and Perrot, architects and engineers, Philadelphia. It is a 3-storey structure 104ft. by 43ft., and is of reinforced concrete throughout. The second floor is supported on reinforced concrete columns spaced about 15ft., and the third floor and roof have a clear span of 39ft. supported on cross beams 12ins. by 26ins., the latter reinforced by eight 1¼-in. round rods. The slabs are 4½ins. thick, reinforced with ⅜-in. round rods on 6in. centres. The beams are 7ins. apart. The floors have a 2-in. cinder concrete base over the slabs, with a 1-in. cement top coat. The walls are reinforced concrete, 12ins. thick. The wall construction includes pilasters. The windows were of the metal frame and wire-glass pattern. Edison-Portland cement was used.

About this building, and comprising a part of the plant, were several frame buildings. It was in one of the latter buildings that the fire took place, due, it is said, to spontaneous combustion. Thus, when the fire was in full blast, the concrete structure at certain points was practically enveloped in flames. The contents of the factory made an intensely hot fire. As stated above, the heat was so intense that the wire-glass in the concrete building melted. That the wire-glass melted is attributed to the fact that the windows

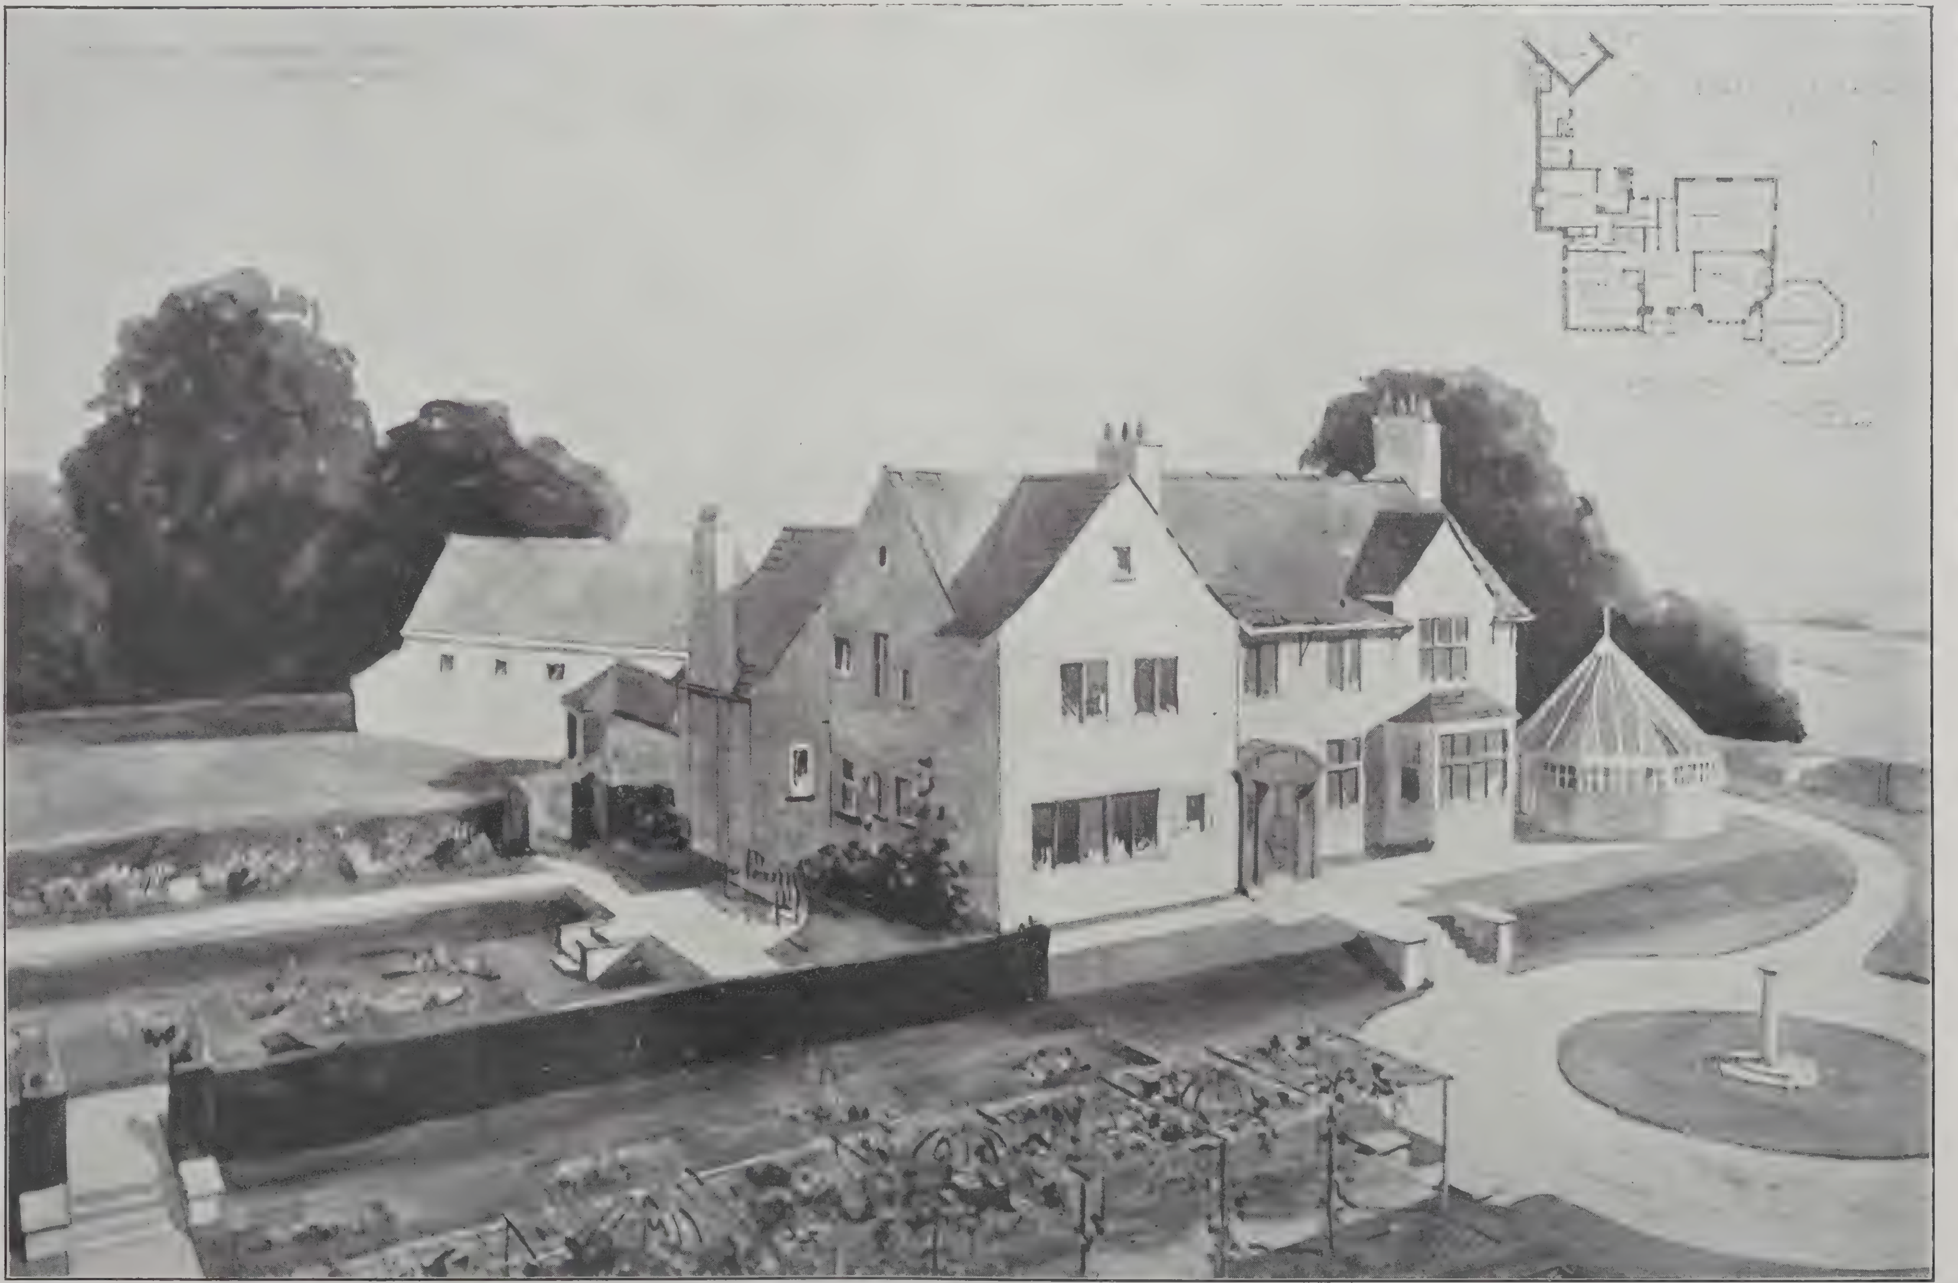
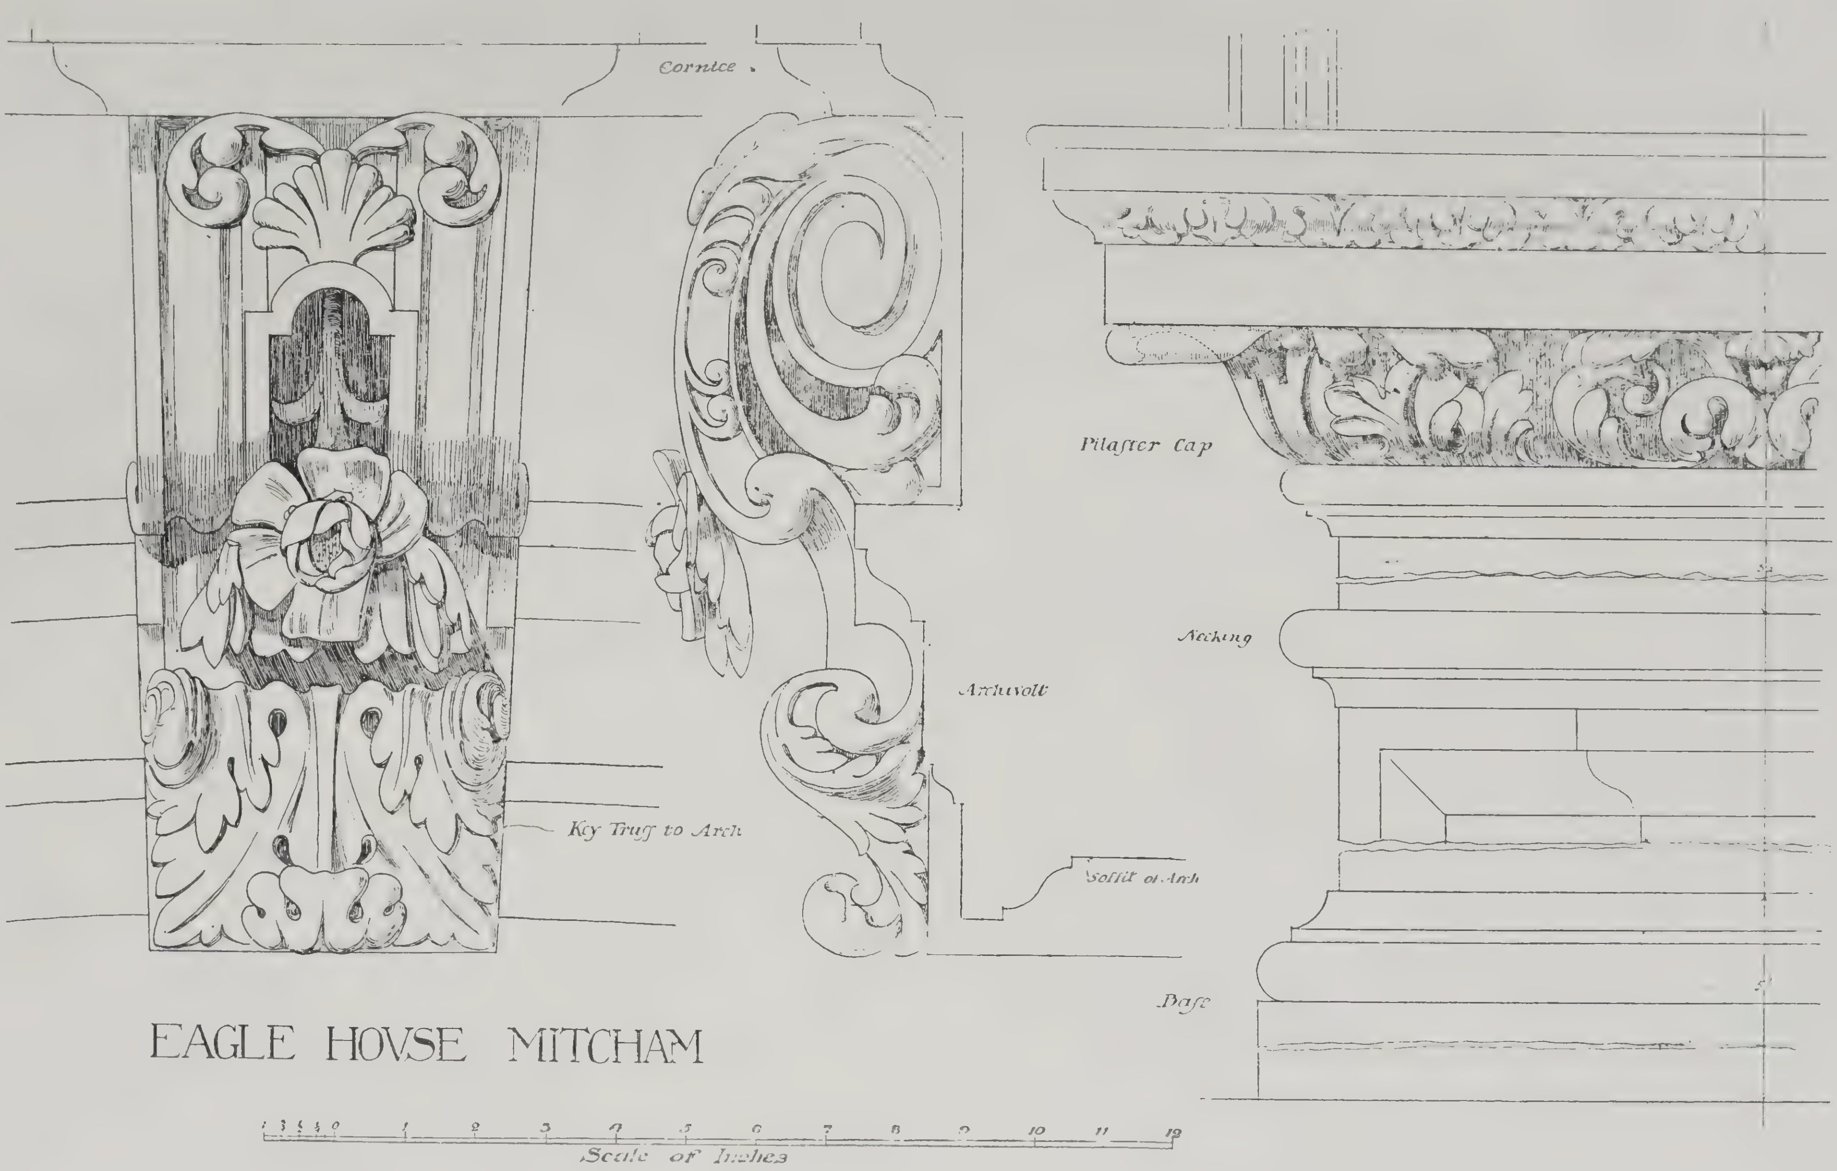
OF THE
UNIVERSITY OF ILLINOIS



HOUSE AT KNARESBOROUGH, YORKS. ARTHUR A. GIBSON, ARCHITECT.



EAGLE HOVSE MITCHAM

MEASURED BY JOSEPH SEDDON AND L. F. JONES, AND DRAWN BY JOSEPH SEDDON.

were open, thus permitting the flames to gain access to the interior, and to surround the glass. Judging from previous tests of wire-glass it would probably have withstood the heat with the flames confined to one side. Wooden drying racks in the concrete building took fire, and soon there was a mass of flames within and without. The buildings immediately adjoining the concrete structure were, with one exception, totally destroyed. Even a brick boiler house adjoining the concrete building was so badly damaged that it was necessary to take down the walls. The destruction of the brick structure affords an interesting comparison with the behaviour of the concrete building. The building that escaped destruction owes its survival to the fact that it was protected by the concrete building, the latter proving to be an effectual barrier to the fire.

When the fire finally subsided, it was found that the concrete building was practically uninjured. That it was thoroughly tested is indicated by the fact that a wire lath and plaster ceiling suspended from the roof beams was practically destroyed. The ceiling was not intended as a protective feature, but merely to prevent the beams from deflecting or interfering with air currents forced through the room during process of manufacture.

One end of the building was open, and through this the flames concentrated upon a concrete column which merely spalled. Shrinkage cracks here and there had widened under the stress. The bottom of a concrete cantilever had also spalled, but the damage can all be repaired at slight cost by patching. The vital parts of the structure remained intact.

The owners are so pleased with the behaviour of the building, that they promptly authorised Ballinger and Perrot to prepare plans for additional reinforced concrete buildings to replace the structure destroyed.

No practical purpose would be served by going further into the details of this fire. It only remains to be said that the result corresponds with practical tests of other concrete buildings subjected to the same conditions. The unusual circumstance in this case was the fact that the structure was attacked from within and without, but, as stated, the slight damage can be repaired at trifling cost. So far as this building is concerned, the business of the firm can proceed without interruption, and with the new buildings of reinforced concrete there will be established a plant upon which the item of insurance may be eliminated, to say nothing of the satisfaction of knowing that fire cannot harm it.

MADISON SQUARE GARDENS, NEW YORK. McKIM, MEAD, AND WHITE, ARCHITECTS.

OVERBUILT MANCHESTER.

Mr. M. K. North, a local Government Board inspector, has held an inquiry at the Manchester Town Hall into the application of the Corporation to be excused from the statutory obligation to build houses to take the place of those that have to be demolished in order that the Education Committee may build three new schools. Sir W. H. Talbot, town clerk, presented the case for the Corporation. Mr. Councillor Johnston opposed the application on the ground that, in his judgment, it will be better financially, as well as from a health point of view, for the Corporation to go on with the housing scheme at Cheetham.

This housing plan was agreed upon four or five years ago, and land was bought which is costing the city over £500 a year. Plans of houses to be built and estimates of cost have been prepared, but when the Council was asked for a final decision it decided that there are so many empty houses in the city that it would be a waste of money to go on with the housing scheme. Accordingly a deputation waited upon Mr. John Burns, President of the Local Government Board, and asked him to relieve the city of the necessity of providing new houses in lieu of the few that have to be removed to make way for new schools. The Education Committee wish to build three new schools. They have secured the sites. On these sites there are 36 labourers' dwellings. There are also several small shops, but the Working Classes Act, 1903, takes no cognisance of shops; it concerns itself with labourers' houses only. It has been found that in the three localities there are 732 empty houses within half a mile of the houses which it is proposed to demolish, and that these untenanted dwellings may be had at rents equal to those paid for the houses now occupied. In these circumstances the inspector was asked to advise the Local Government Board that there is no necessity to build more houses.

The Lord Mayor said he had personally visited the three localities, and was of opinion that a housing scheme was not needed because of the large number of empty houses at small rents.

Sir Thomas Shann expressed a similar opinion. Three schools are needed to accommodate the 2,000 children now attending the seven existing schools. The sites for the new schools have been bought and paid for with £19,830. "The children concerned," he added, "are among the poorest we have, and we think they ought to be put in better schools as quickly as possible."

Mr. C. H. Wyatt said he knew the district affected, and was convinced there is ample house accommodation within an easy distance of the 36 houses that are to be pulled down.

Mr. Alderman Copeland gave supporting evidence, adding that if the application is granted it will mean a saving of £16,000 or so. He also read a letter expressing approval of the application by the Retail Traders' Association.

This concluded the case for the Corporation.

Several persons who occupy shops that are to be demolished pleaded for compensation for disturbance. They said they had spent many years in these shops, and if they were turned out they would be ruined; they did not know where to go, and in any case they would have to build up new connections, which in these days of keen competition was a hard thing to do.

The inspector expressed sympathy with these people, but feared they were outside the scope of this inquiry.

Mr. Councillor Johnston appealed to the Inspector to advise that the housing scheme be proceeded with. In his judgment a serious loss will be sustained if it is not gone on with. Land on the Temple Estate has been bought. True, it can be sold, he said, but his experience has taught him that buying and selling land by municipal authorities are two different things.

Mr. Caminada said that many property owners are in distress and have petitioned the overseers for a remission of their obligations, "as it was impossible for us to meet their demands."

The inspector said he had spent nearly half a day in making himself acquainted with the districts in question. He also pointed out that the several tenants of the threatened houses and shops had had four or five years' notice that the houses were needed for a public work, so that it could not be said, he thought, that the Education Committee had hurried the business.

An international housing congress will be held in Vienna, May 27th to 30th, 1910. It is expected that about 300 delegates will attend.

* * *

The Lincolnshire C.C. have accepted the tender of Messrs. Andrew Handyside and Co., of Derby, for the erection of a new bridge over the Welland at Fosdyke, between Spalding and Boston, at a cost of £16,834. The old wooden bridge, which will now be demolished, was built 100 years ago, at a cost of £22,000, and was used for the passage of Scotch cattle from the North to the Eastern Counties and London.

* * *

The Vice-Chancellor of Oxford University has received an intimation from Mr. John B. Carrington, Hampstead, of his intention to contribute to the University the sum of £160 with a view to the completion of the carving in the coffers of the gallery niches in the new schools, according to a design and estimate furnished by the architect, Mr. T. Graham Jackson, R.A. Mr. Carrington has already contributed sums towards the carrying out of the decorative carving in the schools, amounting to about £570.

Fire Prevention Notes.

Steam Motor Fire Engines. A novelty of some importance in connection with motor fire engines, has been invented by Messrs. Merryweather and Sons, Ltd., whereby, it is claimed, a steam motor fire engine can proceed to a fire with the same celerity as a petrol machine, and with more certainty. The apparatus consists of a connection whereby steam can be kept in the engine boiler at 100lbs. pressure, this being suitable for pumping and for travelling. With the introduction of this new device, steam cars of the Merryweather and other types, especially those used for domestic purposes, the doctor's car, the ambulance, etc., can start instantly. The apparatus has been inspected by the London Fire Brigade and many of the Lancashire and Yorkshire brigades. It promises to be a desirable improvement in steam motor travelling, as the apparatus is also arranged for heating the engine-house and hose-drying towers.

Fire Prevention in Paris. At a three-days' conference of the French Fire Service Association held in Caen at the end of last month, considerable attention was paid to what may be regarded as "the previous question," that of fire prevention. The case of fire-service officials is comparable to that of enthusiastic doctors. Each exists by curing the evil that each is highly desirous of preventing, which would be a rather paradoxical position if cynically viewed, and if everybody were not most poignantly aware that, in spite of the utmost that can be done, neither fire nor disease will ever be wholly preventable. Much, however, remains to be done before we can even hope to reach the irreducible minimum of risk. Our French friends are apparently determined to go as far as possible in this direction, as they have decided to form a National Fire Prevention Council. A special commission, comprising about thirty members, was to be appointed with the object of preparing a scheme of organisation. M. Lépine, Prefect of the Paris Police, has consented to act as chairman, and several representatives of Government departments are expected to join. It is believed that the work of the council will be largely educative —that is to say, that an earnest attempt will be made to enlighten the general public with respect to the general, and especially the minor, means of fire prevention. This, it seems to us, is to begin at the right side. If, beginning with the school-children, the public can be induced to take an interest in the subject, a very substantial reform will naturally ensue. It is ignorance and apathy that lead to the perpetuation of risks and calamities that are quite preventable, and ought to be prevented. Those who devise or supply the ways and means of fire prevention need more than anything the support of an intelligent and a sympathetic public opinion. It is only in this way that, in process of time, the present apathy will be looked upon as something almost incredible and well-nigh criminal.

Fire at York Minster. It was mentioned in this journal a fortnight ago that a slight fire at York Minster had for a short time endangered the existence of that noble and beautiful fabric, which has on several occasions in the course of its long history suffered from fire, and was once set alight by a lunatic incendiary. On the occasion of the most recent outbreak, the first hydrants that are kept in the Minster were brought into play, and hose was taken on to the roof, as soon as it was discovered that some of the beams had caught fire, and the danger was soon averted. Happily, we are spared the pain of showing a damaged York Minster, for the fire has left no visible traces; but we cannot forego the pleasure of showing a view of a building that one never tires of seeing. The antiquity of the Minster is very respectable. The Minster that was begun by Edwin about 628, finished by Oswald about 635, and repaired by Wilfrid, was probably burnt down in 741, if this indeed is the church in the city of York that Richard Hovenden refers to in his chronicle as having suffered that fate. Albert apparently rebuilt the Minster in 767-80, and it was at least partly, and perhaps wholly, burnt in 1069. Thomas built the nave, the transepts, and perhaps the choir about 1080, and Roger rebuilt the choir and crypt in 1154-1181. The towers are all of the fifteenth century. The choir was injured by fire in 1829, and the nave in 1840. The Minster's experience of fire is, therefore, rather extensive—but hardly more so than that of most buildings of its age—and decidedly peculiar.

Printing Office Fire Precautions. Printers are, with excellent reasons, extremely keen on fire prevention. Last month we reproduced the substance of an excellent paper on fire prevention, written by a well-known printer, Mr. Ralph Hazell. We now note that another eminent firm of printers, that of Messrs. Bemrose and Sons, Ltd., have got to the length of holding a fire-brigade tournament and sports, the first of their kind in Derby. The object was to bring together all the private amateur fire brigades in the town, of which there are eight. Details of the tournament are not to hand, but as it is mentioned that Superintendent Thomas Breaks, of Nottingham, and Superintendent Melhuish, of Derby, were present as judges of the "open fire brigades event," it is to be supposed that some of the competitions were of a sufficiently serious and practical character. Some amateur brigades, indeed, develop very considerable skill and smartness, when, as is probably the case at Messrs. Bemrose's establishment, the men are allowed frequent opportunities for practice. The brigade at a large London printing office—Messrs. Cassell's, Ludgate Hill—used to drill regularly under professional supervision, and was often called out on test alarms. Nor was their exercise confined to mere display. Upon more than one occasion they had had to fight actual outbreaks, and they have always conquered. At this establishment, too, and doubtless at many others, the employees are—or were—periodically exercised in the use of fire-escape appliances. Messrs. Cassell's office, when built some five-and-thirty years ago from the designs of the late Mr. Chambers, was considered to be a marvel of fireproof construction, and in that respect was no doubt re-

STUDENT STRIKE-BREAKERS.

The work of rebuilding the new home for the Paris Students Association in the Rue de la Bucherie came to a standstill owing to a strike of ironworkers. The students took up the job. When this photogra was taken they had hardly discarded the character of students. (*See page* 267.)

presentative of the best that was possible in those remote days; the main staircases being of stone or of iron, the window-frames of iron, while iron doors divide the various departments It must have been one of the first buildings in London to adopt a complete sprinkler installation; and at every turn there are hand grenades, extincteurs, and rows of red pails kept constantly replenished with water for fire service. The fire dangers to such a building come mostly from without, and we believe that of the several outbreaks that have been speedily suppressed at Cassell's, nearly all have been communicated from neighbouring buildings. Upon one occasion the amateur brigade at Cassell's remained on the roof all night quenching the sparks and embers that fell from an adjacent building that was completely destroyed. Amateur brigades, therefore, are not to be despised, but deserve the stimulus and encouragement that Messrs. Bemrose seem disposed to mete out to them.

Fire Panics. Cinematograph exhibitions have been, at home and abroad, provocative of so many fires and panics—the latter usually more serious in their consequences than the former—that it is not surprising to find the Sheffield licensing justices imposing such stringent regulations as to suggest that these magnates are themselves suffering from a sort of panic. They have decreed almost prohibitive conditions. All such places of entertainment are to be connected by telephone with the fire station, and the licensee is to pay the cost of a city fireman's being in attendance during every performance. In every case the chief constable is to be satisfied that all reasonable precautions have been taken against accident and danger to the public. The cinematograph is to stand in a box constructed entirely of metal and asbestos, fitted with automatic doors and shutters; and the machine is to be cleaned and examined every day. That is all very well; but the city fireman and the chief constable must be indeed of the more or less mythical race of supermen if they are able to prevent panic. Their very presence is about as encouraging as the sight of the ambulance corps on the field of battle. The way to inspire confidence and prevent panic is to familiarise the public mind with the knowledge that the building is thoroughly fireproof and that the exits are ample. But this assurance cannot precede the fact. Old buildings should be so modified, and new ones so planned and constructed, as to inspire the public with full confidence in the efficiency of the provisions for safety against fire or blocked exits. The means are available; and it only remains for the authorities to insist in their application; instead of which they call in the city fireman and the chief constable, both of whom might be more worthily employed.

STUDENT STRIKE BREAKERS.

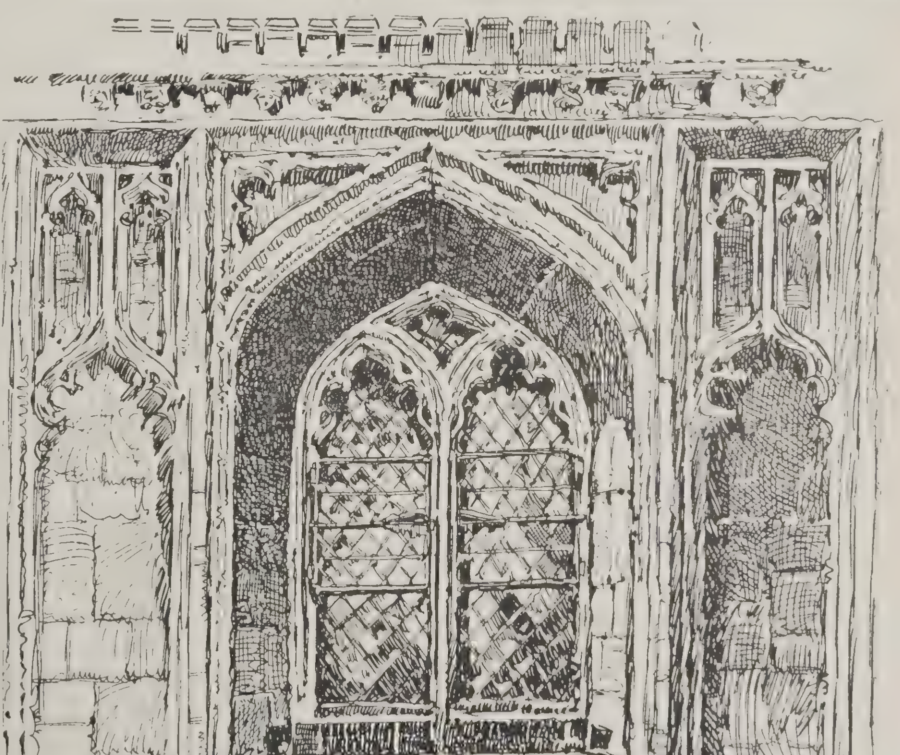
In consequence of a strike of Paris ironworkers, the work of erecting the new building for the Paris Students' Asssociation (Rue de la Bucherie) came to a standstill. The students, fearing that the completion of the building might be delayed so as to prevent its being ready for occupation at the recommencement of their term, determined to take the matter into their own hands. Accordingly, a group of them, under the leadership of their president, M. Jullien, set to work and put up the iron supports at the summit of the building. That having been accomplished, the work in the rest of the building is going ahead without interruption. The illustration not only serves as a souvenir of this curious incident, but has an inherent interest as a characteristic example of French methods.

Mr. Philip P. New, a retired architect, of Clement Royds Street, Rochdale, who has died suddenly from heart failure, was 61 years of age.

THE RENOVATION OF LONDON'S GUILDHALL.

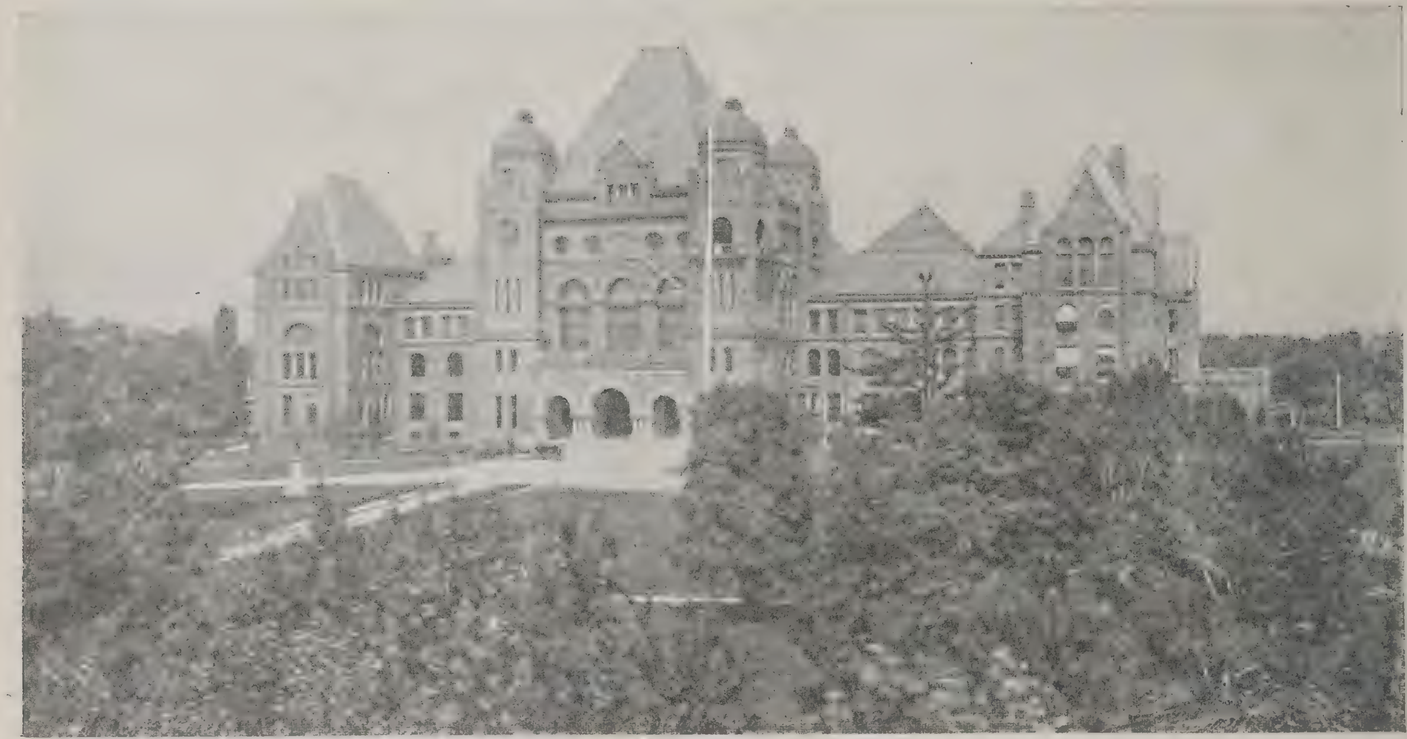
Discovery of Fifteenth Century Window.

The work of removing by means of high-pressure steam the dust and grime of centuries from the columns, panels, and walls of the Guildhall has been completed, the result being that the interior of the Great Hall has undergone quite a transformation. The work has been an unqualified success, the appearance of the building having been vastly improved by the removal of a great deal of dirt and the wash work, which not only to a large extent detracted from the dignity of the hall, but was the means of concealing much of its architectural beauty. The bare stone in its original colour has been disclosed to view, and in some places evidence of the ravages of the Great Fire of London, which left only the bare walls standing, can be seen. The removal of the silicate paint which has so long concealed from view the original masonry promises to have results which were in no way anticipated by the City Lands Committee when, acting on a suggestion by the City Surveyor, Mr. Sydney Perks, F.S.A., they entered upon the work. Quite by accident Mr. Perks discovered, hidden behind a mass of plaster, one of the original windows with which the home of the City Fathers was equipped in the days of the fifteenth century. While superintending the removal of the plaster covering in one of the recesses, he discovered that the masonry behind, instead of running at right angles, travelled in a diagonal direction, and this caused him to continue the investigation, with the result that in a short while a casement was brought to light. The committee, whose chairman is Mr. W. Hayward Pitman, C.C., were, says the "City Press," immediately made acquainted with the discovery, and Mr. Perks received instructions to go forward with the work, and open up the complete window. This has now been done, and the window can be seen in all its original charm of outline, the tracery of the arches into which it was built being of a beauty which will excite the admiration of all qualified by knowledge to form an adequate opinion of the importance of the find. First, the window was covered in with wood, the recess being entirely blocked up with brickwork and plaster. The casement is believed to be of fifteenth century construction, and the hasps of a shutter which covered it in are still in position on each side of the window. It is 9ft. 6in. in height, and 6ft. 6in. in width. The glazing is not thought to be of any great age, and, in fact, the Surveyor, who has taken the advice of authorities on glass, entertains the view that it is only of nineteenth century date. The "find" induced the Surveyor to continue his labours on the other side of the Great Hall, where there was a similar panelling of plaster; and it was not long before the masons discovered the remains of another window contemporary with that previously revealed. Unfortunately, the architecural features of the ancient casement are missing with the exception of the arches springing from the top, the mullion having been destroyed. It is a matter of regret that the hand of Time should have thus dismantled so interesting a relic of the fifteenth century. The further discovery is, however, of considerable importance in an archæological sense, and further investigations will probably be fruitful of additional discoveries in connection with the really ancient fabric of the Guildhall. In the



A NEWLY DISCOVERED FIFTEENTH CENTURY WINDOW.

This window was recently discovered by Mr. Sydney Perks, F.S.A., the City Surveyor, while superintending the renovation of the Guildhall, London. It was hidden behind a mass of plaster.



THE PARLIAMENT BUILDINGS IN TORONTO.

The west wing of this building, which has been burnt, is on the left side of this picture. An enlarged view, taken from the rear of the building, is shown on the opposite page. The illustration here shown is reproduced from the magazine called "Canada."

meantime the Surveyor may be congratulated on his interesting find, which adds immensely to the value of the work originally undertaken. The accompanying illustration of the window is reproduced from the "City Press" by the courteous permission of the proprietors, Messrs. W. H. and L. Collingridge.

THE GREAT FIRE AT TORONTO.

The Ontario Parliament Buildings at Toronto, of which the west wing was destroyed by fire at the beginning of the present month, are situated at the south end of Queen's Park, Toronto. They consisted of a massive block of buildings erected during the years 1888 to 1892 from the designs of Mr. Waite, of Buffalo. The block cost approximately £260,000, and the damage is estimated at a million dollars. The west wing is that shown on the left of the illustration, which is reproduced by courteous permission of the editor of "Canada," a magazine devoted to the interests of the Dominion. A further illustration shows the extent of the damage. The second floor of the extreme west wing contained the library, consisting of 300,000 volumes, and the Law Offices, where the judges have been engaged in making a most thorough revision of the Statutes of Ontario. In the west wing, too, were the quarters of the Clerk of the House, the rooms where the records of committees were kept, and the committee rooms. At the back were the Speaker's apartments, the Ministers' dining-room and smoking-room. Other offices in the block were the Labour Bureau, the Registrar-General's office, and that of the Inspector of Insurance. In the block were housed the housekeeper and his family. Until recently, the building was not insured, but about May this year negotiations were completed for an insurance of $1,000,000 fortunately. At the back of the central building there was building construction going on.

Mr. Thomas Barnsley, J.P., of Edgbaston, Birmingham, retired builder, who died on June 19th, aged 78, left £79,972, including £10 to each female servant of twelve months' service.

Correspondence.

The Budget and the Builder.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with interest your leader, "The Last Straw for Brickmakers," in your number of the 22nd inst. I am afraid it will be a sorry thing for the building trade, but the Budget proposals effecting the trade unfortunately do not stop here, as in addition to the brick clay, which of course includes terra cotta and paving and roofing tiles, and the coal which burns them, it is proposed to tax lime (so largely used for mortar and plasterer's stuff, and also for cement), slates, stone, lead, copper, iron, and, of course, zinc, incidentally, unless imported; timber, glass, and paint are all that are allowed to go free, and in view of these things we are asked to believe that these proposals will *benefit* the trade.

As regards the proposals of the taxation of undeveloped land, I have no doubt that the effect will be for all those owners of undeveloped land who are men of substance, that each annual tax which may be paid will be added to the capital value of the land, and as a consequence make undeveloped land (which we may regard as a builder's raw material) still dearer.

I am convinced that if all who are associated with the building trade fully realised what these proposals mean, there could not possibly be two views upon the question as to whether the Budget is good or otherwise for the building trades.

S. COOPER STEVENS, architect.

Birmingham.

[It will be noted that the proposal to tax brick earth has been abandoned.—ED.]

NEWBURN NEW COUNCIL OFFICES.

A special meeting of Newburn Urban District Council was held at Newburn to receive the report of Mr. R. J. Leeson, the assessor, on the sixteen competitive plans sent in for the proposed new council offices. In his report Mr. Leeson stated that he had no hesitation in advising that first place be awarded to the set of plans No. 15. The second premium he would award to the author of No. 3. He explained that No. 15 complied with all the council's requirements in an economical and satisfactory manner. The author suggested the squared frontage.—which Mr. Leeson thought wise—and all his public offices were entered from a well-lit hall. On the first floor the council chamber and committee-room were thoughtfully arranged. The author also showed how a large council chamber could be obtained if required. The caretaker's house had been placed on the lower ground floor, taking advantage of the slope of the ground. The elevations were excellent on all sides, being well proportioned, and would in execution give a dignified character suitable to the purpose of the building, and this in an economical manner. The set of plans No. 3, Mr. Leeson considered, ran the design placed first very closely. The council examined all the plans, and unanimously decided to adopt the assessor's recommendation, accepting plans No. 15, and appointing the author of these—who proved to be Mr. Edward Cratney, Wallsend—as the architect to carry out the work, and awarding the premium of £10 to the authors of No. 3, Messrs. Marshall and Tweedy, Newcastle.

Proposed New Works.

COVENTRY.—The proposed new church of St. Margaret's is estimated to cost about £6,919. The site, which is at the junction of Walsgrave Road and Argyll Street, has cost £556.

CROYDON.—Application has been made to the Local Government Board by the Town Council for sanction to borrow £10,800, a sum which is to be used in connection with additions to the Borough Hospital for infectious diseases.

HAMBLEDON, SURREY.—At a meeting of the Hambledon Rural District Council, a letter was read from Messrs. Charles Russell and Co., asking for the Council's approval of proposal for constructing bridges connecting up different portions of Witley Court. It is proposed to construct a bridge over the existing road close to Furze Field

Wood. It is suggested that the present road level shall be eased down at this point by about two feet, and that a full headway of 12ft. should be kept beneath the bridge. The bridge is to be formed of steel girders, joists, cement concrete, masked entirely in oaked boarding and with high oak parapets. It is proposed to form the abutments of the bridge in cement concrete, faced, as far as may be necessary, with Bargate or other hammer dressed rubble stone. The existing boundary wall at the north side would be maintained and underpinned as necessary, the opposite bank not to be interfered with. It is also proposed to form a bridge near Brook. It will be constructed of stone parapets, arches, piers, and facing walls, the actual bridge being formed in reinforced concrete, the roadway to be over a bridge of its full width and with a rise with the length of the bridge of 20ins. A temporary bridge is to be constructed to carry traffic during the construction of the new bridge. The intention is to form a new private road running beneath the road leading to Brook and Hindhead Common. The matter was referred to a committee.

MATLOCK.—A scheme for the development of Matlock as a pleasure resort is vaguely estimated as being likely to cost anything between £10,000 and £20,000.

OBAN.—A portion of the proposed new Episcopal Church is shortly to be erected. When completed the church will consist of a central nave, choir, chancel, and sanctuary, having aisles at each side, terminating in fine transepts, in height and width equal to the nave. Mr. James Chalmers is the architect.

RADCLIFFE, MANCHESTER. — Towards the £1,500, the estimated cost of the proposed sanatorium for consumptives in Radcliffe and district, the promoters of the scheme have received promised contributions amounting to £1,000, and they are hopeful that very shortly they will be in a position to determine a definite scheme.

ROTHESAY.—The Town Council now has under consideration the question of providing a pavilion, which it is proposed to erect for the accommodation of 1,000 persons at a cost of £3,500.

SWANSEA.—A Local Government Board inspector has held an inquiry into the Council's application for a loan of £2,800, for the purpose of a new scheme for the provision of houses for the working classes.

WEST BROMWICH.—It has been proposed to erect a new Council school here for 1,280 children, at a cost of not more than £12 10s. per head. A local architect and a local builder are, it is believed, to be selected for the work.

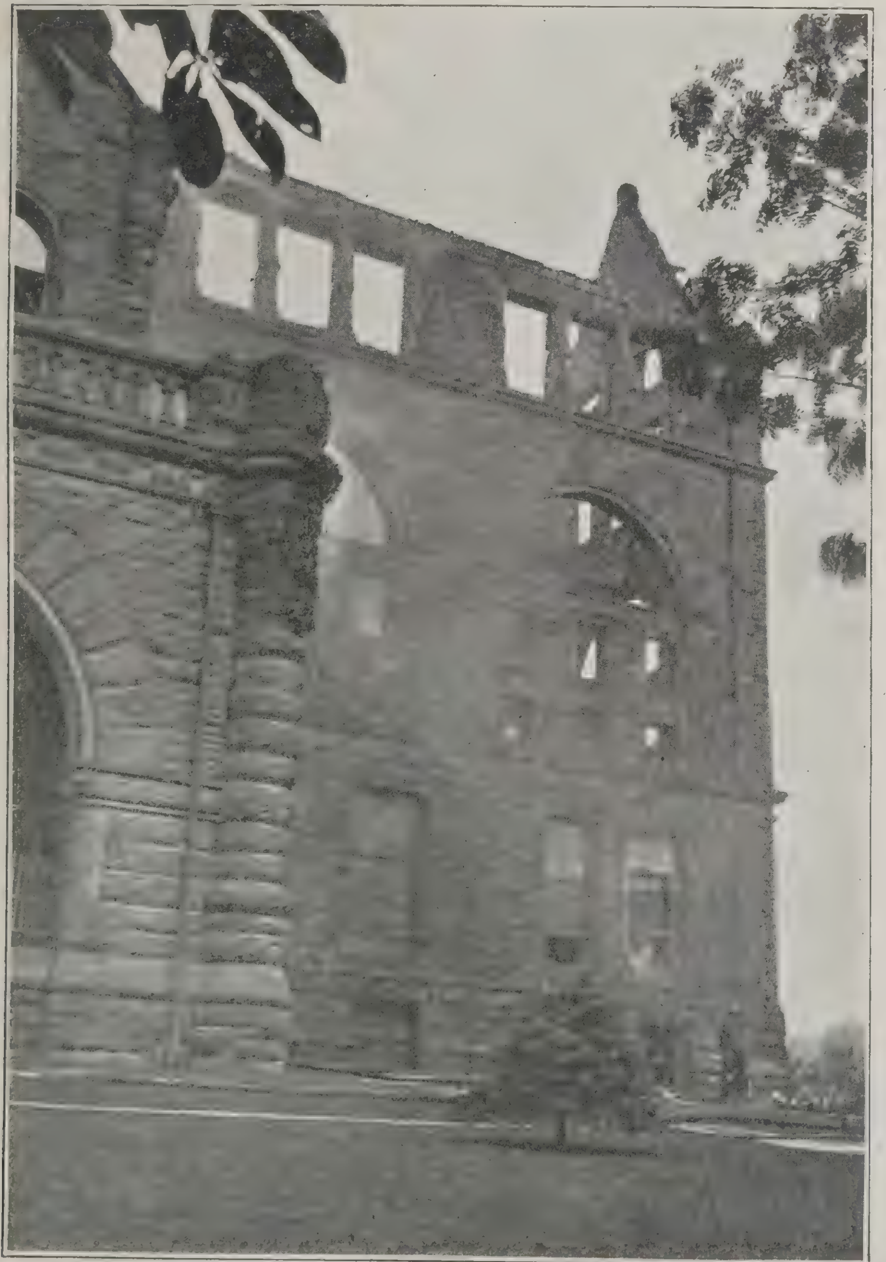

Photo: Topical.

WEST WING OF THE PARLIAMENT BUILDINGS, TORONTO.

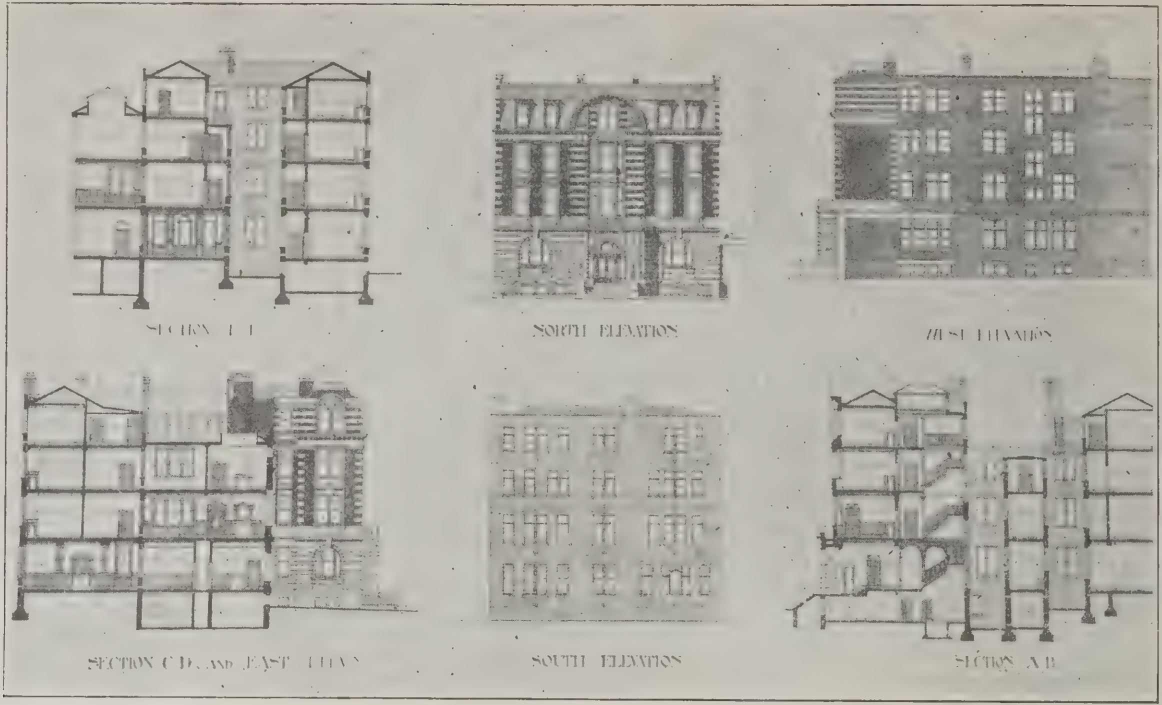
An account of the fire, and a view of the complete building, are given on page 249.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Nov. 1.	TECHNICAL SCHOOL. The Corporation of the Borough of Kendal invite architects residing and practising in Westmorland to submit a competitive design, together with a written description and estimate for the erection of a technical school. Premiums of £15, £10, and £5, are offered: the designs to become the property of the Corporation. Particulars may be obtained free from the Borough Surveyor.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30. and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas respectively will be awarded for such two designs as shall be judged of sufficient merit by the Council, and placed by them as first and second; the premium of twenty-five guineas to be afterwards merged into the usual commission payable to the architect, provided the work is carried out by such competitor. Plan of the site and copy of the conditions may be obtained on application to the undersigned on and after the 24th instant on payment of one guinea, which will be returned on receipt of a bona-fide design. Drawings to be deposited at the Clerk's Office, Town Hall, Herne Bay, not later than noon on the 30th November next.—Joseph Jubb, Clerk to the Council, Town Hall, Herne Bay.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly. Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist and advise the committee in deciding the competition. The competition will be for the educational block and for the general laying out of the estate including the position of the various hostels, swimming bath, laundry, sanatorium, principal's house, vice-principal's house, lodges, gardens, playing-fields, roads, etc. On the payment of a deposit of £2 2s. (which will be returned on receipt of a bona-fide design) each competing architect may obtain a copy of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings. Designs to be delivered to the undersigned not later than 12 o'clock noon, on Saturday, 18th December, 1909. James Graham, Secretary for Education, Education Department, Leeds.
Jan. 31, 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., which will be returned on receipt of a design in accordance with the conditions, or if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.



BERKS COUNTY COUNCIL OFFICES. SECOND PREMIATED DESIGN. E. J. SHREWSBURY, ARCHITECT.

BERKS COUNTY COUNCIL OFFICES.

This week we show the second premiated design in this competition, the first having been illustrated last week.

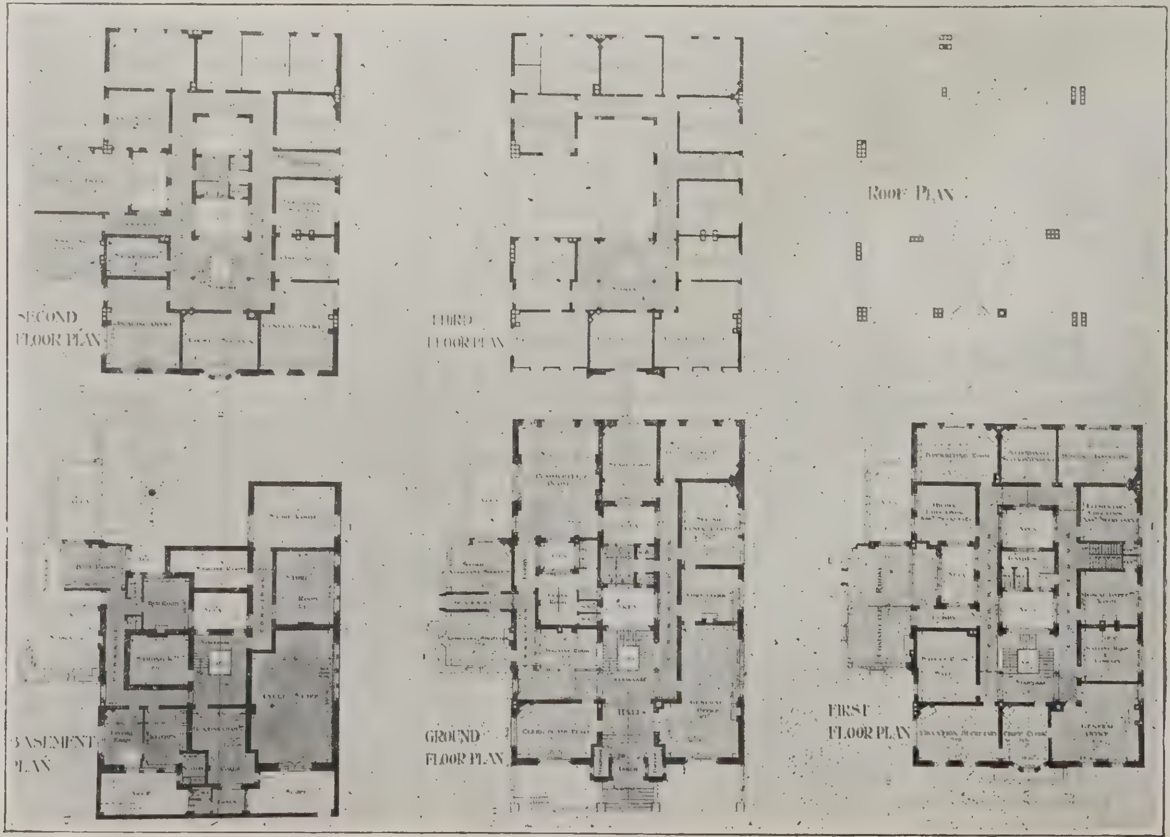
In the second premiated design—that of Mr. E. J. Shrewsbury, of Maidenhead, the various departments are arranged on separate floors, and in distinct blocks, and direct communication is provided for between the heads of each department and their assistants.

All the general offices and waiting-rooms are close to the main staircase and lift, which are centrally placed, immediately opposite the entrance. A secondary staircase is provided from the first to the third floor. Access from the Assize Court to the new buildings is arranged on the ground floor, and also on the first floor.

The committee-rooms are so placed as to be in direct communication with the court. Both rooms have a considerably larger area than is required by the conditions, and the Education Committee room is arranged to be divided into two rooms, each having its own fireplace and entrance door. The provision of central areas allows for efficient lighting and ventilation of the whole of the corridors and lavatories, and there is direct and simple connection with the main drainage

Separate cloak-room and lavatory accommodation is provided for (1) members of committees, (2) officials and staffs of the various departments, and (3) ladies. The caretaker's apartments in the basement have a separate entrance, are self-containing, and can be cut off completely from the rest of the building. Storage for 40 bicycles is also obtained in the basement, with a separate entrance, and so arranged that all the machines can be separately placed.

For the elevations, Lawrence's Bracknell facing bricks would be used, with Portland stone dressings. The roof to be covered with Silberthwaite Westmorland bright sea-green slates. The floors to be in reinforced concrete, with metal lath ceilings suspended under. The buildings throughout to be warmed by radiators, fireplaces also being provided in all principal rooms and ventilating flues carried up in chimney stacks.



BERKS COUNTY COUNCIL OFFICES. SECOND PREMIATED DESIGN. E. J. SHREWSBURY, ARCHITECT.

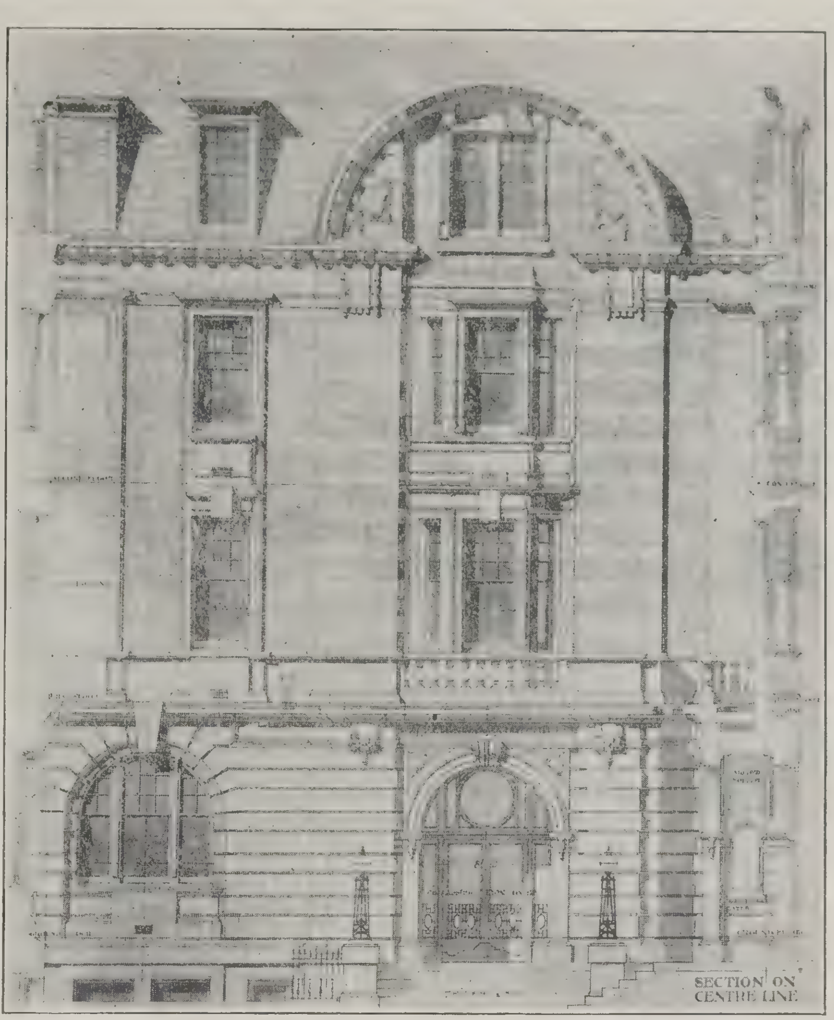
BUILDERS' BURNING QUESTIONS.

Hull Contract and Trade Practice.

At the meeting of the Yorkshire Federation held on September 17th, two or three matters of trade interest arising out of the relations of members with architects were carefully considered. Mr. E. Quibell, president of the Hull branch of the Federation, stated that they desired to call attention to what in their opinion was a hardship that had been suffered by one of their members. The member referred to had sent in a tender as subcontractor for the joiners' work in connection with a Council school, and amongst the several materials required was some floorboarding. This was specified to be of pitch pine, American first quality, *special selected straight grained*, free from sap, knots, and all other defects. In working out his quotation the joiner had obtained from various timber merchants prices to supply to this specification. A sample of the boards was submitted, and so far as the joiner was aware everything was satisfactory. The clerk of works saw the boards and had raised no objection. Upon delivery, however, they were ultimately rejected, the architect stating that he wanted *rift-sawn* boards. The joiner approached the timber merchant, whose price had been accepted, who of course refused to supply such boards at his previous quotation. A consultation then took place between the joiner and the city architect, when the joiner stated that he had not estimated for rift-sawn boards, and further that the specification did not provide for this quality. Some considerable delay ensued, and repeated interviews occurred on this matter. Finally the joiner proceeded to supply rift-sawn boards, on the understanding that at the finish of the contract he would have consideration shown to him.

Upon the final statement being presented, the joiner was unable to make any satisfactory settlement with the architect, and he approached the local association to assist him. He stated that the difference in price between the quality estimated for and that actually supplied was about one hundred pounds. The case was considered, and a deputation of joiners and timber merchants appeared before the Education Committee in support of his case. The deputation expressed the opinion that the specification was not definite, and would not be interpreted by them, with their practical experience and expert knowledge of the trade, to mean that rift-sawn boards were intended to be supplied. They further contended, as evidence on behalf of this, that rift-sawn boards had not been required for previous contracts, under similar conditions, and that the city architect, on issuing a specification for another school shortly after this dispute arose, altered the specification to read as follows: "The pitch pine to be American specially selected first quality, the flooring boards to be best quality specially selected pitch pine, *straight grained*, *rift-sawn*, free from sap, knots, and all other defects." This, they argued, on the face of it proved that the architect saw the necessity of altering the specification, and consequently the joiner ought, in view of all the circumstances, to have his claim allowed. After hearing evidence, the Committee asked the deputation to retire. As the statements were not controverted by the city architect, they were of the opinion that their ideas had been favourably received, and were subsequently considerably disappointed to learn that the Education Committee could not see their way to allow the additional amount claimed.

The Hull Association considered that the sub-contractor had been harshly treated, and, having regard to the expense of opening litigation with the Hull Corporation (especially bearing in mind that by the contract agreement the city architect was sole arbitrator), the contractors engaged on the work had agreed to share the loss in order that the retention money which had been outstanding for some time might be certified and paid



BERKS COUNTY COUNCIL OFFICES. SECOND PREMIATED DESIGN.
E. J. SHREWSBURY, ARCHITECT

Several members held very strongly that the joiner was absolutely correct in his interpretation of the quantities, as the quality insisted upon, being dearer in price, was consequently never calculated for by the trade unless explicitly described in the specification and quantities. Strong emphasis was again placed on the absolute necessity of contractors continuing their agitation for the more extended recognition and use of the contract form adopted by the R.I.B.A., and the paramount necessity devolving on all members to loyally decline to sign any contract which does not provide for the reference of all disputes to an independent arbitrator.

Dewsbury Dispute as to Extras.

At the same meeting of the Federation particulars were reported of a dispute which had arisen between a member of the Dewsbury Association and a local architect with respect to extras. Although the architect was a member of the Royal Institute of British Architects, he used a contract form in which he was appointed sole arbitrator, and by which the contractor became responsible for the accuracy of the quantities. Several members referred to the anomalous position of some architects' placing the onus of the accuracy of the quantities on the contractor, although they were compiled by the architect.

It was reported that the officers of the Federation had unsuccessfully endeavoured to obtain an interview with the architect with a view to arriving at a settlement if at all possible. The architect had, however, written to say that he was under the contract appointed sole arbitrator, and on no account would he surrender that position.

The Federation decided to call the attention of the trustees for the work under consideration to the recent legal decisions, and also to the fact that the architect was not using the contract form adopted and recommended by the Institute of which he is a member. It was further decided that the Federation should give every assistance in order to bring the matter to a friendly and successful issue.

Priced Schedules with Tenders.

The recommendation of the National Federation with respect to priced schedules with tenders was read. As this is in accordance with the custom and practice of the Federation for many years past, the president emphasised the necessity of members loyally co-operating in the strict observance of the recommendation, both in their own interest and that of the trade generally.

The Engineer as His Own Arbitrator.

The president drew the attention of the Federation to a decision by which the appointment of a city architect as sole arbitrator had recently been set aside by the Court of Appeal. The action was R. W. Blackwell and Co. v. the Mayor, Alderman, and Burgesses of the Corporation of Derby. The contract was for laying down a tramway, and the general conditions of contract contained a clause of inordinate length giving the borough engineer every conceivable power, and making any award by him final and binding on both parties. The date of completion was fixed, with a penalty of a certain sum per week failing completion at the time named. Although the time for completion was extended by about three months, the work was not complete at the expiration of this time, and consequently a deduction of £1,500 was made as liquidated damages for delay. The plaintiffs alleged that there was constant changing of plans from the time the contract was signed; that the Corporation delayed its decision as to certain interlacing lines and other important matters; and that the order in which the work had been agreed to be carried out was subsequently altered, thus rendering the material in hand useless, and necessitating the obtaining of other material before the work could proceed; that a reasonable amount of material was not allowed to be placed on the footpaths ahead of the work; and that an unusual number of samples of sand were rejected, apparently in an unreasonable way. In giving judgment, Lord Justice Fletcher Moulton expressed the view that any case of this kind must be decided on the facts, and that, where the nature of the dispute arising from the facts which were subsequent to the contract was such that the tribunal was not likely to be able impartially to deal with the dispute, it was open to the Court, and would usually be their duty to refuse to enforce the arbitration clause. In the present case the dispute was as to whether the engineer had not from the first acted unreasonably towards the contractor. It could not be said that the arbitrator was an unfit judge merely because he was an officer of the Corporation; but if facts subsequent to the signing of the contract had given rise to a substantial dispute involving allegations of continued unreasonableness on his part, the Court would not be acting in the spirit of the law if the dispute were referred to arbitration. In his opinion Corporations were often too fond of putting their officers in the position of arbitrators under a contract. Lord Justice Buckley, in giving judgment, remarked that the matter to be determined was whether the contractual referee was an unreasonable person. The worst possible referee on the question of unreasonable conduct was the person who was accused of being unreasonable. It was not human nature to suppose that he could properly determine whether he himself was an unreasonable person.

Warrington Corporation and Arbitration.

In a recent arbitration between Mr. Lawson and the Warrington Corporation, the usual clause declaring the engineer to be the sole arbitrator if any dispute arose was inserted in the contract, but the Corporation agreed to waive the condition, and consented to the appointment of an independent engineer for the purpose of ascertaining the amount in dispute.

The president and several members expressed satisfaction at these decisions, and hoped that they would have a beneficial effect in preventing architects and engineers being appointed sole arbitrators.—J. DAVIDSON.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns

By-laws for Building Inspectors.

SOUTHPORT.—SIDNEY writes: "I require the by-laws of the Local Government Board for the use of a building inspector in a large town. What should I ask for in order to get what I understand to be a comprehensive volume on the subject?"

Knight's Annotated Model By-Laws will probably best serve your purpose. Write for catalogue to Charles Knight and Co., Ltd., Tooley Street, S.E. It would be advisable also to apply for lists to Messrs. Eyre and Spottiswoode, New Street Square, E.C., and to Mr. B. T. Batsford, 64, High Holborn, stating your special requirements.

Stress Diagram for Hammerbeam Truss.

ORMSKIRK.—C. B. writes: "Enclosed is a frame diagram for a hammerbeam truss, loaded as shown, with reaction on left-hand side, vertical in order to obtain a maximum thrust on the right-hand side. The force diagram works all right until the nodes ringed round are reached, when point x on the force diagram cannot be found. There is evidently something inconsistent. Will you tell me what? If the reaction on the right be taken vertical obtaining the thrust on the left-hand side, there is no difficulty; but ought not the force diagram to be obtainable for either way?"

The elevation of the hammerbeam truss is shown in Fig. 1, and the frame diagram with loading as given by querist as in Fig. 2. Querist's inability to get the stress diagram to close up is easily accounted for by the fact that he did not obtain the true reactions. The correct diagram is shown in Fig. 3. Besides the stresses there shown, there will be bending moments on the curved members.

HENRY ADAMS.

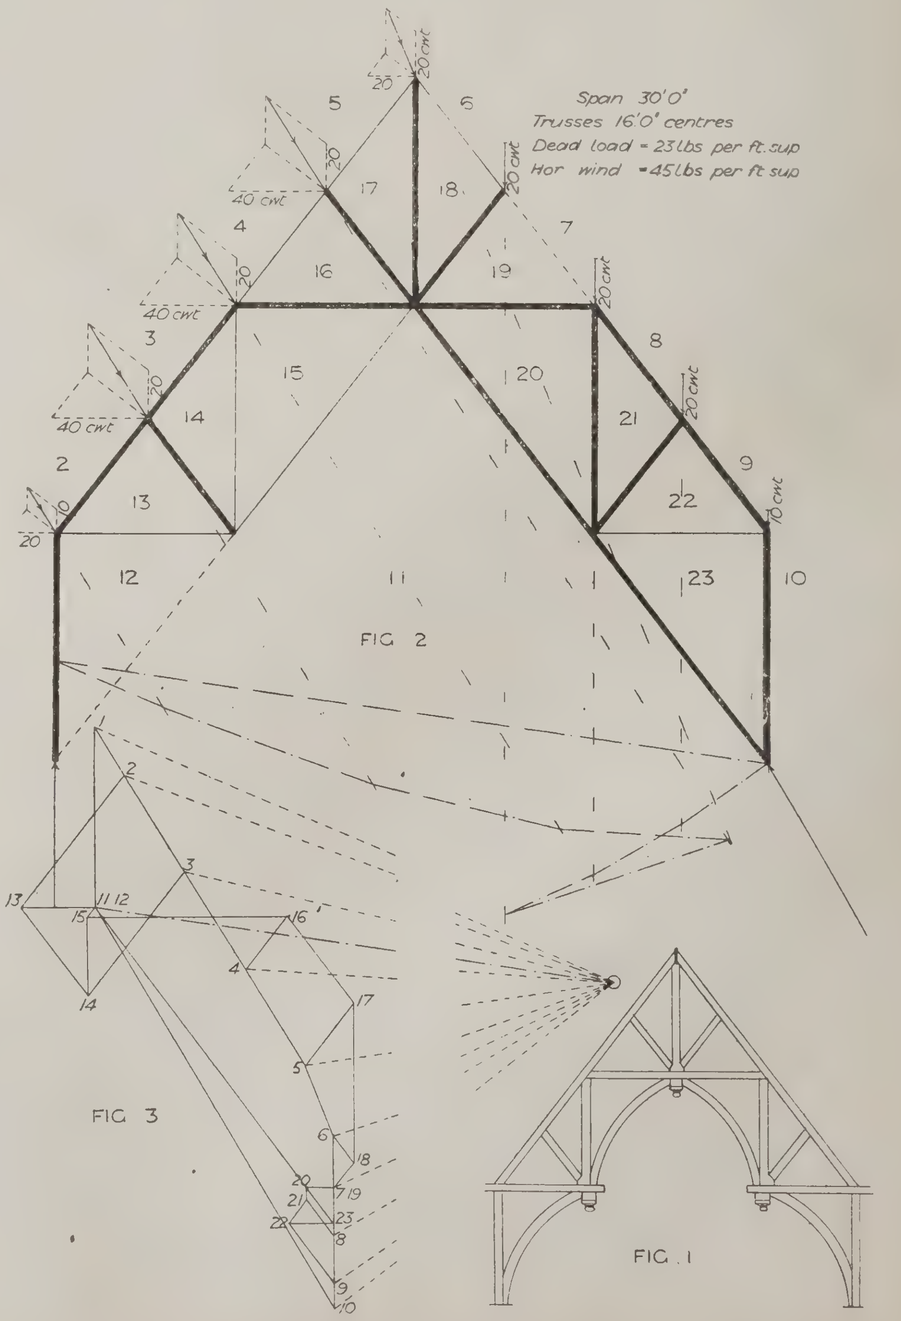
Brick Clay as a Mineral.

An interesting point in last week's discussion on the Finance Bill was the admission by the Attorney-General that the Government had doubts as to the advisability of including clay as a mineral for taxation under their proposals. Only a few hours before this announcement was made, the Secretary to the Treasury informed the House as he had done on a previous occasion, that the Chancellor of the Exchequer was not prepared to introduce a special exemption for brick clay. The Government, not unnaturally, have declined to define the term "mineral." At present the courts are trying to do so. One appeal is under the consideration of the House of Lords—who are expected to give their judgment before Christmas—and the question involved relates to the working of sandstone.



STRESS DIAGRAM FOR HAMMERBEAM TRUSS. SEE ANSWER TO "ORMSKIRK."—C.B.

Refuse Destructors and Depreciation.

Mr. Samuel Roberts asked the Chancellor of the Exchequer whether land which had been depreciated in value or rendered valueless for building purposes by refuse destructors, smallpox, fever, or consumption hospitals being placed in close proximity to it by local authorities, would be subject to the proposed land taxes.

Mr. Hobhouse, Secretary to the Treasury, in reply said clause 14 of the Finance Bill provided that for the purposes of the land taxation provisions of the Bill, the value of the land would be its market value, which would allow for any depreciation due to surroundings.

Removal of Statues from Dublin Museum.

Mr. T. M. Healy asked the Secretary to the Treasury whether the Board of Works had taken down 12 statues of heroic size by the late Sir Thomas Farrell, P.H.A., which ornamented the façades of the Dublin National Library and Museum; when were these statues erected, and at what cost; was this an important element in the architectural scheme of these buildings, and were they to be replaced; were several of the statues damaged in course of removal; what expert advice was taken on the allegation that the statues were in danger of falling; was it the fact that only one statue had suffered dilapidation, and, if so, why, instead of restoring the injured statue, were they entirely taken away, unless it was intended to replace them by work equally graceful and ornamental?

Mr. Hobhouse, in a printed reply, stated: I am informed that the position of affairs is as follows:—The statues were erected in 1889. Pieces of them began to fall down about five years ago, and inspections were made from time to time by the architectural staff of the Board of Works to ascertain the condition of the stone, which was found to be bad in all three statues of each of the four groups. The parapet and other parts of the building were damaged by the falling pieces of stone, and finally it was decided in July last, after a further inspection, which showed that the stone could not be preserved or repaired, to take the statues down, as they constituted a grave danger to the public. All the figures showed signs of considerable disintegration, some very much more than others, and, though the operation was carried out with all possible care, the condition of nine of the 12 figures made further damage unavoidable. The original cost of these statues was about £800, and at least an equal sum would be required to erect groups now. The question whether or not similar groups should now be erected is under consideration.

Walmer Castle.

Sir John Benn asked the First Commissioner of Works whether he had suggested the free opening of Walmer Castle and grounds; whether objection to this was raised by the Walmer District Council; whether the Deal and Walmer Chamber of Commerce, representing the commercial interests of the whole district, had approved with practical unanimity of the free opening; and whether, in view of the fact that Walmer Castle was a building of national and historic interest, he could see his way to carrying out his original intention of removing the present restrictions to the free enjoyment by the public.

Mr. Harcourt, in a printed reply, stated that the answer to the first three questions was in the affirmative. In view of the unfortunate difference of local opinion, he did not intend to take any immediate action in the matter, but he hoped that the Walmer District Council might eventually find themselves more in accord with what he believed to be the general sentiment, so that he might be enabled to open this castle with its interesting historic associations to the public.

Housing and Town Planning Bill.

The amendments in the House of Lords of the Housing and Town Planning Bill have been described—for electioneering purposes—as "mutilation," "destruction," and "hopeless crippling"; but it is nevertheless evident that so far the really useful principles in the Bill have not been touched as yet by any item in the thirty-eight pages of amendments that stand on the order paper. The Peers have carried an amendment substituting independent inquiry for Local Government Board authority with respect to the compulsory acquisition of land against the will of the owner. A similar limitation was insisted on with respect to the compulsory enforcement of housing schemes. The Bill said that the Local Government Board could compel the local authority to "carry out such works and do such things" (in the way of pulling down houses and building others) "as may be mentioned in the order." The Peers decided that, before being enforced, the order must lie on the table of both Houses, and if either House within thirty days presents an address against the draft, the order of compulsion is null and void. This was carried by ninety-six to twenty-four, the Government vainly resisting. Nearly all the amendments have for their object the safeguarding of the individual from the oppressive exercise of compulsory powers.

FIREPROOFING AGRICULTURAL BUILDINGS.

One direction in which fire-prevention precautions have been greatly neglected is with respect to agricultural buildings, which, commonly constructed of wood, and sometimes stored with highly inflammable materials, fall an easy prey to the flames. In America, a newer tradition is being established. The barn and silo shown in the accompanying illustrations (see page 255) were designed by J. M. Madison, Caledonia, N.Y., for Mrs. John Jay Chapman, Barrytown, N.Y. The steel construction for the barn is of the truss frame type, anchored to concrete piers, carried from foundation to top of second floor. The floors on the second storey are of reinforced concrete with 12in. I beams, Clinton wire cloth being used as a reinforcement, the steel used in the structure being furnished by J. B. and J. M. Cornell Company, New York City. The concrete block used, both in the construction of the barn and silo, were made on the Hercules block machine, made by the Century Cement Machine Company, Rochester, N.Y. The second storey of the barn is designed to have a storage capacity for 200 tons of hay. The structure, as designed, is practically fireproof, and from this standpoint represents an economy in the erection of buildings for farm purposes.

THE LATE M. AUGUSTE CHOISY.

The sudden death is announced of M. François Auguste Choisy, the distinguished French architect and archæologist. Born at Vitry le François on February 7, 1841, he entered the Ponts et Chaussées, of which he became engineer-in-chief and finally Inspecteur Général Honoraire, and he was also professor of architecture in the Ecole of the corps. He was especially known for his studies in the history of architecture, and he did much to elucidate the methods of construction employed by the ancients. His works, which were remarkable for their clearness and conciseness of expression as

FIREPROOFING THE RAILWAY PLATFORM.

An interesting example of the extensive adoption of reinforced concrete for strength and fire-prevention at the Union Stock Yards, Chicago.

well as for the wealth of facts embodied in them, included a series of three treatises on the art of building among the Romans, Byzantines, and Egyptians respectively, and a volume of "Etudes épigraphiques sur l'architecture grecque." But his chief work was a "History of Architecture," which took him more than 20 years to bring to completion. He was also the author of two books of travel. M. Choisy's work was well known to architects and archæologists in this country, and in 1904 he was present in person to receive at the hands of Sir Aston Webb the Royal gold medal which was conferred on him by the unanimous recommendation of the Royal Institute of British Architects.

In presenting M. Choisy, on June 20th, 1904, with the gold medal of the R.I.B.A., the president, Mr. (now Sir) Aston Webb, recalled the titles of the works that have made M. Choisy famous wherever interest in such subjects is taken. They are "L'Art de bâtir chez les Romains," 1873; "Le Sahara," 1881; "L'Art de bâtir chez les Byzantins," 1882; "Etudes Epigraphiques sur l'Architecture Grecque," 1883; Histoire de l'Architecture," 1898; and "L'Art de bâtir chez les Egyptiens," 1903, together with other smaller works. The first of these great works, therefore, was "L'Art de bâtir chez les Romains," published in 1873; the last, "L'Art de bâtir chez les Egyptiens"—which, as one may say, has put a crown to M. Choisy's life work—was published so recently as the year 1903. In "The Art of Building among the Romans," M. Choisy first introduced us to the Roman search for an economical method of building vaults and domes. Alberti had already discovered how walls were built by the Romans, but he went no further, and the great marvels of the building of vaults and domes were still undiscovered. He has shown us, amongst many other things, how experience enabled the Romans to abolish the open network which kept the green centering in place, and how to adapt a single brick for the thickness of these great vaults of eighty feet span by inserting pieces of a second course to secure the corners at the junction, and by using the rubble or concrete filling in horizontal courses, the means probably adopted to equalise the pressure in the dome of Hadrian's Pantheon; all this is clearly shown in M. Choisy's illustrations. In his "Art of Building Among the Byzantines" he shows how the Romans, with diminished means, were enabled to build vaults without centering. M. Choisy's great work, the "History of Architecture," is a masterly exposition of the treatment of a subject from a single point of view. The result of fifteen years' strenuous labour, it is the history especially of architectural construction from the earliest times to the present. The innumerable line illustrations are nearly all the work of his own hands, drawn for the most part in isometric perspective in the inimitable manner of the French draughtsman. In his "Art of Building among the Egyptians," he has developed the theories set forth in the Egyptian section of his history, and concludes his researches into the methods employed for centering their great arches and in lifting their great monoliths. His work on "Greek Inscriptions" contains a series of studies in Greek inscriptions in the Arsenal of the Piræus, and the walls of Athens, and the Erechtheum. A marble slab was discovered with a complete specification for the building of the Arsenal. A noticeable point in M. Choisy's work is the clearness and conciseness of his style; for M. Choisy puts in three lines what many would have taken three pages to describe. M. Choisy's works are not merely historical accounts and records of buildings, but are the result of entirely original research and thought. It was on account of these invaluable scientific researches into the history of architectural construction contained in those volumes that M. Choisy received the Royal Gold Medal.

Federation News.

The Yorkshire Federation.

A meeting of the Executive Council was held at the Council Chamber, Town Hall, Bridlington, on Friday, September 17th. Mr. W. R. Thompson (president), occupied the chair, and was supported by 29 delegates from the associationns.

Councillor C. G. Southcott, Mayor of Bridlington, accompanied by Councillor J. V. Mainprize, Deputy Mayor, was present, and extended a hearty welcome to the Federation.

The president (Mr. Thompson), in tendering thanks to the mayor and deputy mayor, acknowledged the appreciation of the Federation for their kind welcome, especially bearing in mind the onerous duties of their office, which entailed much self-sacrifice for the services devoted to public affairs. He asked to be permitted to use the opportunity of inviting their kind attention and enlisting their sympathy in one or two matters of principle which had recently engaged the serious attention of the Federation. They were glad to hear that the Bridlington Corporation had not established a works department. The Federation had abundant testimony that these departments in other towns had resulted in serious loss to the ratepayers, while the efficiency of the work was in no case greater, but in many cases considerably less, than similar work carried out by contract. The Federation thought it was most unfair that the prestige and credit of public authorities should be used in direct competition with the interests of private traders. They were strongly of opinion that municipal trading should be exclusively confined to the recognised monopolies, i.e., tramways, gas, etc.

The Federation also strenuously objected on principle to the appointment of city engineers or architects as sole arbitrators. This was distinctly opposed to the recognition and enforcement by local authorities of standard conditions, as the Royal Institute of British Architects published an approved form of contract which contained an arbitration clause, together with other conditions which were fair and equitable for the proprietor, the architect, and the contractor.

The Federation further objected to the requirement of some engineers that the bills of quantities should be returned duly priced with the tender. In the opinion of the Federation, the proper course was for the contractor whose tender was accepted to be furnished with a further set of quantities, with a view to his filling up and completing same for deposit with the engineer or architect.

The Mayor informed the president and members that the matters to which their attention had been drawn would receive careful consideration as occasion required.

On the motion of the president, seconded by Mr. J. Biggin, the best thanks of the Federation were tendered to the mayor and deputy-mayor of Bridlington for their cordial welcome, and for placing the Council Chambers at the disposal of the Federation for the meeting.

Apologies for absence were reported from Alderman W. H. Jessop, J.P. (Huddersfield), Councillor W. Nicholson (Leeds), and Messrs. A. Moulson, and T. E. Taylor (Bradford), and P. Rhodes (Leeds).

The treasurer reported receipt of £40 16s. 6d. towards the National Reserve Fund. The Finance Committee reported that they had examined the accounts and recommended payment. On the motion of Mr. W. 1. Ledgard, seconded by Mr. A. J. Forsdike, it was resolved that accounts amounting to £39 3s. having been examined and certified as correct be approved, and that cheques be drawn in payment thereof. The treasurer reminded the members that the Federation had already entered on the last quarter of the financial year, and that the subscriptions to date were considerably less than the estimated expenditure for the year. He further pointed out that only six associations had sent remittances on account of the National

A FIREPROOF BARN AND SILO.

This barn and silo were designed and erected by Mr. J. M. Madison, of Caledonia, N.Y. It is built of machine-made concrete blocks on a steel framework. The second storey has a storage capacity for 200 tons of hay.

Reserve Fund, and that he still required a large sum to meet the payment of £190 0s. 10d. due by the Federation on or before December 31st. He earnestly appealed that these matters should receive urgent and earnest attention, in order that the Federation might honourably meet its obligations and maintain its record in this respect.

The president reported that the Finance and Emergency Committee, at a special meeting, had carefully considered the written observations of the local association with respect to the draft sub-contract form submitted for their consideration. After taking these carefully into account, the committee had made several alterations, additions, and amendments, and recommended a revised form for the consideration of the Council. The various clauses were read and considered in detail. It was ultimately resolved, on the motion of Mr. W. T. Ledgard, seconded by Mr. R. Raper, to refer the revised agreement to Mr. W. H. Hope, solicitor, for consideration, with a view to embodying the principles which were generally approved by the Federation in the said agreement.

It was reported that, in accordance with the invitation of the Federation, the National Conference of Secretaries would be held at the Hotel Metropole, Leeds, on Tuesday, October 19th. On the motion of Mr. A. J. Forsdike, seconded by Councillor W. G. England, J.P., it was decided that the Federation should provide tea for those who are present, and the Council earnestly urged that the secretary of each local association should be authorised and make arrangements to be present, and further requested the officers to attend as the official representatives of the Federation.

Mr. A. J. Forsdike reported that the Sheffield Association had given notice to the bricklayers' and joiners' societies, to expire on March 1st, 1910, for alteration of rules. The notice was: (1) to abolish walking time; (2) reduction of wages by ½d. per hour; (3) alteration of any other rule which might be necessary or advisable.

Correspondence was read with respect to the National Federation's opposition to Clause 30 of the Housing and Town Planning Bill. It was reported that the clause had been struck out in Committee, and that an attempt had been made on the report stage for its re-introduction, but the Speaker had ruled the amendments out of order.

The Federation considered the proposals of the Government with respect to unemployment, insurance, and labour exchanges.

It was pointed out that the building trade will be most seriously affected by any legislation dealing with these subjects, and it was resolved, on the motion of the president, seconded by Mr. A. J. Forsdike, to request the National Administrative Committee to take these matters into earnest consideration, and inform their members as to any action which should be taken for the protection of the trade generally and for the furtherance of employers' interests; especially bearing in mind the expressed intentions of members of the Labour party to obtain if possible provision in the labour exchanges for meetings of trade unionists, differentiation of unionists and non-unionists, and practically a suspension of the exchanges during trade disputes; and also their endeavour to secure that unemployment insurance shall be non-contributory so far as workmen are concerned.

Mr. Rushford, president of the Grimsby Association, stated that a local architect was in the habit of giving the final certificate to the building owner, instead of to the contractor, and asked for an expression of opinion as to the prevailing custom in other towns. The secretary was instructed, on the motion of Mr. A. J. Forsdike, seconded by Councillor J. Dawson, to obtain information as to whom the final certificate is usually sent by architects—the proprietor or the contractor; and to ascertain whether this point is covered by any agreement with the R.I.B.A. or any other institute.

Mr. Rushford, president of the Grimsby Association, asked for information as to experience of builders in other towns, where the tenure is leasehold, as to charges for licences for converting dwelling-houses into business premises. In Grimsby, agents of landowners are enforcing surveyors' and solicitors' charges in addition to increasing the amount of the ground rent, and these charges were now becoming very onerous.

Information on this matter will be much appreciated by the Federation secretary.

It was reported that the Selby Association had invited the Federation to hold the next meeting in that town. The invitation was cordially accepted, and the meeting was arranged for Thursday, October 21st.

The president and members of the Bridlington Association entertained the delegates to tea, and a hearty vote of thanks was accorded for their hospitality.—J. DAVIDSON.

Lancashire, Cheshire, and North Wales Federation.

The quarterly meeting of the plasterers' trade committee of the Lancashire, Cheshire, and North Wales Federation was held at the George and Dragon Hotel, Ashton-under-Lyne, on Wednesday, September 22nd, when Mr. James Higson, J.P., Manchester, presided. The attendance was only very moderate.

Matters of general branch trade interest were discussed, the most important being the Government price list and schedule for daywork. It was pointed out by several members that this list was much below the current rates for labour and materials, and the secretary was instructed to endeavour to obtain copies of the said lists and measure bill, so that the matter could be further discussed at the next meeting.

It was decided to hold the next meeting in Liverpool.

A paper on "The Sub-contract Form" was to have been read, but owing no doubt to unforeseen circumstances, the gentleman who had promised to prepare it was prevented from attending.

The representatives were afterwards entertained to tea by the local employers, to whom a very heartly vote of thanks was recorded.—JOHN TOMLISON, secretary.

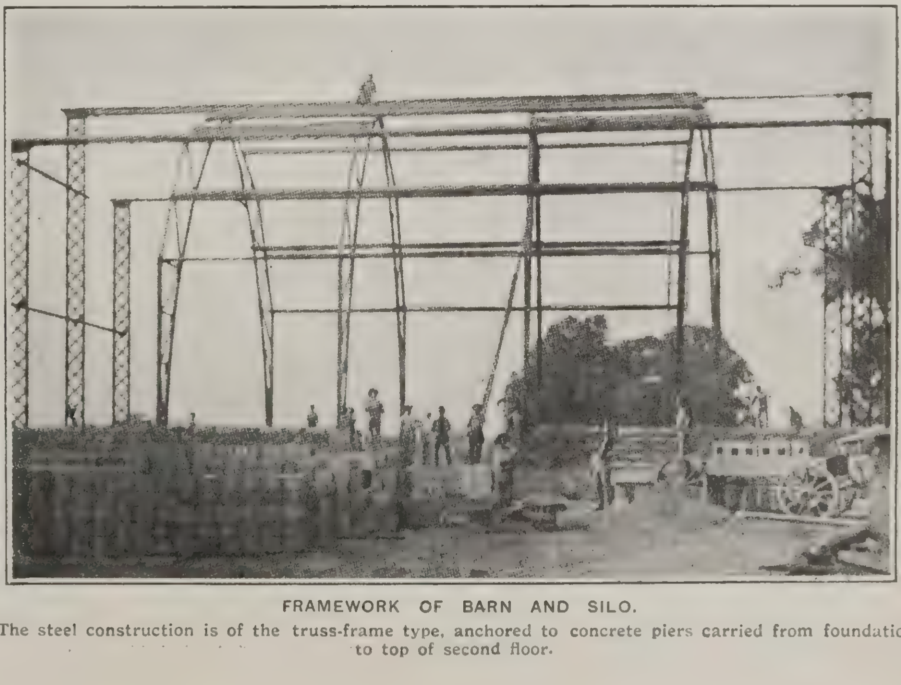
MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The monthly meeting of the General Committee of the Manchester, Salford, and District Association was held at the Boardroom, Blackfriars Street, on Thursday afternoon, September 16th, at 3.30 o'clock, when the president (Mr. Samuel Gerrard) presided over a well-attended meeting.

Five new members were elected.

Some discussion took place on the question of municipal trading by the Manchester and



FRAMEWORK OF BARN AND SILO.

The steel construction is of the truss-frame type, anchored to concrete piers carried from foundation to top of second floor.

Salford Corporations, but ultimately it was decided to place the matter on the agenda for discussion at the next meeting.

It was reported that as the result of an advertisement appearing in the local Press for priced schedules to be sent in along with tenders for the erection of an underground lavatory in the city, a deputation from the association waited upon the City Surveyor at the town hall a short time ago, and after discussing the matter with them, he had consented to withdraw the condition.

It was reported that the Master Stonemasons had now disbanded their separate organisation in favour of this general association, which was considered satisfactory.

OLDHAM AND DISTRICT ASSOCIATION.

Secretaries: Cowper and Dean.

About 35 members of the Oldham and District Master Builders' Association attended the annual picnic, the place selected being Nottingham. After luncheon at the Victoria Hotel, the party went by coaches over Trent Bridge to Radcliffe, visiting Tollerton Hall, Cockgrave, and other places of interest. After four hours' drive, the party arrived back in Nottingham about 4 p.m., and in the interval before dinner various places of interest in Nottingham were visited, including Nottingham Castle, Arboretum, and the famous market. After dinner at the Victoria Hotel, the party left Nottingham at 7.17 p.m. The Picnic Committee comprised Messrs. Wm. Rose, R. C. Fletcher, and E. Dean (secretary), and the arrangements were carried out by Messrs. Cook and Son, the tourist agents. During the outing several photographs were taken by Mr. John Smethurst, son of the president, Councillor Samuel Smethurst, J.P.

Law Case.

Japanese and Austrian Oak.

In the City of London Court, at the Guildhall, Judge Lumley Smith and a jury concluded the two days' hearing of a case in which Messrs. W. W. Howard Brothers and Co., timber merchants, sued Turpins Parquet Floor Joinery and Wood Carving Company, Limited, of Bayswater, for £46 7s. 3d. for Austrian quality parquet flooring supplied. The defendants counter-claimed for £58 9s. 4d. as damages for breach of contract on the part of the plaintiffs in not supplying "perfectly seasoned oak flooring," and they said that instead of sending Austrian oak the plaintiffs had supplied Japanese timber. The plaintiffs said they had never undertaken to sell Austrian logs. They undertook to supply "Austrian quality" oak, and Japanese was now taking the place of Austrian oak. Austrian oak had now become almost impracticable for trade purposes. It was exceedingly dear, the quality had greatly changed in the last few years, and there was very little of it used. Japanese was in every respect equal to Austrian oak. The defendants called experts to show that Japanese oak was not as serviceable as Austrian, that it took much longer to dry, and that it had been imported only during the last three or four years. Austrian oak, it was said, was infinitely superior to any other for flooring purposes.—Judge Lumley Smith said he hoped English oak was still being used, and he was told it was. The jury found for the plaintiffs on the claim and counter-claim.

Trade and Craft.

"Aston" Electric Radiators.

Now is the time of year when heating engineers are busiest, and, very opportunely, Messrs. Veritys Ltd., of 28 and 31, King Street, Covent Garden, and of Bristol, Birmingham, Manchester, Liverpool, Newcastle, Glasgow, Dublin, and Leeds, have published a compact little booklet showing, with copious illustrations, their "Aston" luminous and non-luminous type electric radiators. These are of many patterns, some of which are really elegant; and they are of diverse materials—copper, bronze, antique silver finish, brass, and wrought iron; and, by size, shape, and appearance, they are severally fitted for almost every kind of environment, from business office to boudoir. It is a very serviceable list.

Uralite Fireproofing Specialities.

The British Uralite Company, Limited, 16, St. Helen's Place, London, E.C., have recently added to their ordinary manufacture of uralite and asbestone (cement slate), fireproof plaster partitions of the following sizes: width, 12ins.; length, 4 or 6ft.; thicknesses, ⅝in. to 2ins., ¾in. to 2½ins., 1in. to 2¾ins., 1¼ins. to 4ins., 1½ins. The main ingredient of this partition is asbestos fibre, which renders it absolutely fireproof and sound proof. The use of reeds is avoided, and consequently vermin and moisture are not harboured. The material has great strength, is readily erected, and can be sawn and nailed in the same manner as ordinary boarding. We are promised further particulars of these partitions. This firm's products are fireproof, non-conducting, clean and dry, and can readily be fixed to roofs, walls, ceilings, partitions, etc., by an ordinary carpenter. The fact that the London County Council, H.M. War Office, H.M. Office of Works, and H.M. Admiralty, have adopted them to a very large extent, partly accounts for their increasing popularity. Uralite and asbestone are made in flat sheets up to 6ft. by 3ft., and from 1-16in. to 1in. in thickness. The company report a rapidly increasing output of asbestos-cement roofing tiles. So great has been the demand for these tiles, 200,000 having been shipped in one consignment to the Argentine, that the company have been obliged to install an additional machine capable of producing 1,000 tiles per hour. A roof constructed of these tiles is shown at the Uralite Pavilion, which is situate outside the Machinery Hall at the Great White City.

The State of the Timber Market.

Messrs. Denny, Mott, and Dickson, Ltd., in their wood market report, dated September 2nd, state the landings in the docks in London during August consisted of 563 loads of logs and 479 loads of planks and scantlings, or a total of 1,042 loads, as against 476 loads for the corresponding month of last year. The deliveries into consumption were 387 loads of logs and 183 loads of planks and scantlings—together 570 loads, against 385 loads for August, 1908.

Mahogany imports during August were very light, being, however, somewhat augmented by the recent arrival of small lots of Honduras and Tobasco. There were no public auctions during the month, and the market was generally stagnant and depressed. The market for Canadian waney pine has been necessarily quiet, the stocks being so small. Prices are very firm, as there is little or no prospect of any further shipments coming to hand this season. Elm has been quiet, but prices are well maintained, as the stock is modest. Oak of good dimensions continues to be in demand.

The demand for spruce for the outports has been good, and both landed and c.i.f. prices show a tendency to stiffen. The demand for pitch pine has been dull, and although the landed stock continues to be moderate, prices have been slightly easier notwithstanding that shippers demand higher c.i.f. prices for cargoes, owing to the increasing home demand in the United States for this wood. The Oregon pine market has been without feature, but prices are well maintained in face of the higher c.i.f. cost. The bulk of the season's supplies of Odessa oak having been shipped direct into consumption, the landed stocks are now very small, necessitating a hand-to-mouth class of business at very firm prices. A renewal of activity in this market can only come with next year's fresh season's shipments. Last month business in Baltic and White Sea goods was unusually active for August on account of the strong market. A distinct rise has taken place in the lower qualities of White Sea goods. Shippers have practically sold out redwood, except for small and unattractive balances. The labour troubles in Sweden still dragged on, though to some extent shipping still continued at certain ports. Should a settlement not be arrived at in time to remove goods sold, the result will be a big shortage in supply during the winter months. The actual consumption does not show any great improvement, although there is promise of much improved business after the holidays. The volume of business during such a holiday month as August has been better than might have been expected, and there are growing signs of sounder all round business, although the improvement is too gradual to be very perceptible. Perhaps this fact is encouraging rather than otherwise, as it minimises the chance of any set-back.

Rumoured Brick Trade Combine.

There are rumours of a proposed "combine" among the brickmakers of the United Kingdom. The report is denied by several large firms, but the present condition of the trade is such as to suggest some kind of remedial measure. It is reported that the output is at present less than it has been for thirty or forty years, the demand being so low as to employ only 50 per cent. of the total working capacity of the country. This superfluity of capacity is accounted for by the present slump in the building trade, and also by the great number of yards in existence. These works sprang up at the time of the great boom in the building trade some years ago, and now that the building trade has sunk practically to zero the supply is more than double the demand. As a result, many yards have had to be closed, whilst in those which have continued working millions of bricks have accumulated. There is much competition for the little trade obtainable, and the works have to accept orders almost at a loss in order to keep their yards employed.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have been sent to the following:—

NOW READY!

THE NEW EDITION OF

SPECIFICATION

(No. 12, 1909-10.)

Price 3/6 Net.

BY POST, 4/-.

A well-known Architect writes:—

"SPECIFICATION IS SPLENDID and to any Architect or anyone engaged in the Building Trades invaluable."

(*Signed*) C. E. MALLOWS, F.R.I.B.A.

Special Points about the New Edition:

1. It has been very drastically revised and brought up-to-date in conformity with the opinions and suggestions of many well-known Architects and other professional men.

2. A general Index of Special Articles on Planning and Equipment which have appeared in previous issues is included.

3. The information has been rigidly condensed in order to reduce the bulk of the volume, and to make it easier for reference.

List of Sections.

The information in each section is contributed by a Specialist.

Division I.—Building Construction.

1. General Conditions.
2. Excavator.
3. Drainlayer.
4. Concretor.
5. Bricklayer.
6. Mason.
7. Terra Cotta & Faience Worker
8. Structural Engineer.
9. Fireproof Constructor.
10. Pavior.
11. Carpenter.
12. Joiner.
13. Ironmonger.
14. Roofer.
15. Ventilating Engineer.
16. Heating Engineer.
17. Founder.
18. Smith.
19. Plumber.
20. Bellhanger.
21. Mechanical Engineer.
31. Art Metal Worker.
22. Electrical Engineer.
23. Marble Mason and Mosaic Worker.
24. Plasterer.
25. Glazier.
26. Painter and Decorator.
27. Paper Hanger.
28. Horticultural and Landscape Architecture.
29. Blind Maker.
30. Furnisher.

Division II.—Municipal Engineering.

32. Roads.
33. Sewerage.
34. Water Supply.

Supplied by all Newsagents or direct from the Publishers.

TECHNICAL JOURNALS, Ltd.,
Caxton House, Westminster.

Publisher's Notices.

Why is one Man a Foreman another a Superintendent,

Another a General Manager—and the hundred others mere mechanics? He may have no better brain-equipment than the hundreds of workers under him, but he has the necessary technical equipment and thorough training in the science of his work.

It is this thorough training—in every item of technical and commercial work — which the International Correspondence Schools supplies so thoroughly and practically. An I.C.S. Course will give a practical workman a knowledge of his line which he could never get **at his work,** but which he gets twice as quickly because he is studying the reasons —the science—of his work while he is actually at it day by day.

We have thousands of letters from I.C.S. students who have promptly achieved commanding positions and high pay in different lines of work. Let us send you some of them. Let us show you what employers say about I.C.S. men as well Surely they will convince you.

If you have any ambition at all to rise higher you cannot afford to put off finding out about this practical, salary-raising work being done by the I.C.S. the country over.

Architectural Refinements.

The controversy on architectural refinements—as to whether, as claimed by Mr. W. H. Goodyear, certain observed bulging and recessing is, like entasis, due to deliberate design, or whether, as his opponents contend, it is the result of mere accident—drags its slow length along. In the October issue of the Journal of the R.I.B.A., Mr. Goodyear replies to Mr. Bilson's rejoinder, and brings forward a mass of data in support of the contention that the early builders were keen on optical effects, and deliberately abjured the plumb-line in order to achieve an appearance of plumbness by correcting optical illusions. They had, apparently, what Mr. Aymer Vallance would call "a letch for vistas." We will not enter into a controversy that seems likely to go on for ever; but we cannot help remarking that both parties to it seem disposed to push matters to extremes. It is fatally easy to become obsessed either of a theory or of the negation of a theory; and it seems to us that the parties to this controversy are rather too uncompromising, the one side in assertion, the other in denial. We hardly venture to doubt that the principle of entasis, or of optical correction, may have been occasionally employed, but this admission does not commit us to the theory that every bulge is intentional; nor, on the other hand, can we admit the validity of the argument that because such phenomena are often due to settlement, this accident invariably accounts for them, and utterly destroys the theory of refinements. This, we admit, looks like trimming, but we venture to suppose that it comes very near the truth. As a last word on a rather arid subject, we would gently hint that the somewhat excessive refinements observable in the arguments appear to be occasionally derogated in the language in which they are expressed; but the whole controversy is so bewildering that we really do not know whether to attribute the occasional split infinitives to accident or design. Perhaps these also are sometimes intentional, but more often accidental. We should not have mentioned so trivial a matter if it had not seemed to us to be rather significant of possibilities in architecture proper as well as in what the London County Council Education Committee calls "word-architecture." If the writers had succeeded in absorbing our attention in their yawning fissures, we should have had no eye for the splits. *De minimis non curant* when there are bigger things toward. But we certainly admire the pluck and thoroughness with which Mr. Goodyear has thrown himself into his rather thankless task.

Labour Exchanges.

Very opportunely, a writer in the "Contemporary Review" for October gives a most instructive account of the inception and progress of the Central-Verein für Arbeits-Nachweis, which may be more conveniently called the Berlin Labour Exchange. As there can be no doubt that our own labour exchanges will be largely based on the Berlin model, authoritative information on the subject is very welcome, and we have ourselves made arrangements for first-hand investigation of the history and methods of an institution that, through its offshoots, seems destined to have an important bearing on the industrial economy of our own country. The writer in the "Contemporary" has nothing but praise for the exchange. He describes it as "the missing link between employer and employee—between work-giver and work-taker." It began in a very small way in 1883, when possession was taken of five railway arches in the city, which were used as registry offices for unskilled workers of both sexes, and for locksmiths, plumbers, and painters—that is, apparently, for the skilled workmen with whom employment is apt to be peculiarly intermittent. It was found to be doing such excellent work, that the National Insurance Institution agreed to assist its development into a labour exchange. The central authority offered to erect a building at a cost of £55,000, provided the Berlin Municipality would give an annual subsidy of £1,000. A site was found in the Gormann-strasse, not far from the Bourse, and the Labour Exchange proper was opened in 1902. There seems to be not the smallest doubt as to its success. The number of applications has risen from 42,829 in 1902, to 158,098 in 1907, and the municipal subsidy has been increased to £3,000. The administration is in the hands of a Board of 21, who are assisted by a special executive committee representing both employers and employees, and it is added that the virtue and strength of the Exchange arise from the fact that it is thus officered by men of practical knowledge and experience. The Exchange is perhaps unique among German institutions in its freedom from red tape and from all harsh forms of officialdom. The business is conducted with the utmost kindliness and courtesy, so that the persons using it are not in the smallest danger of losing their self-respect. The Exchange building, which accommodates about 4,000 persons, is in fact a sort of club-house for the unemployed, who find in it a welcome refuge from the streets, and who can obtain at its canteen bar a satisfactory meal for 3¾d., "winding up with a cigar!" The visitor was much struck by the cleanly and cheerful appearance of the frequenters, and as we have said, he has full confidence in the utility of the institution. Of course, it is not a panacea for the many and various causes of unemployment. It does not create work, but it saves much unnecessary waste of time and effort on the part of both employer and employed by providing a fixed rendezvous where the twain may easily find each other, and in many ways it is undoubtedly an excellent industrial asset, to say nothing of its mitigation of the hard lot of the unemployed.

The Town Planning Bill in Danger.

There has been a good deal of wild talk about the amendments to the Town Planning Bill that have been carried in the Lords. It has been declared that the Lords have "wrecked the Bill," that they have "completely knocked the bottom out of it," and so forth. Whether or not one approves of the action of the Lords, it must be acknowledged that this description of it is grossly inaccurate. So far, the Lords have left the vital principle of the Bill absolutely untouched. They have simply revised the methods of procedure in the case of compulsory purchase, so as to safeguard the interests of the individual against the possible tyranny or caprice of the oligarchic few who happen for the time to control or direct the action of the Local Government Board. The reception of the Bill in the House of Lords has been, on the whole, very far from antipathetic. The real peril comes from the unscrupulous political partisans who are ever ready to sacrifice the welfare of the community to the exigencies of the political situation —who will, in short, do or say anything in order to catch votes. If the misrepresentation of these opportunists are allowed to prevail, upon their heads, and not upon the House of Lords, will rest the guilt and the odium of destroying a measure that is on all hands acknowledged to be rich in promise for the well-being of the community. As to the ultimate fate of the Bill, much no doubt will depend upon the temper of Mr. John Burns. If he keeps a cool head, and takes the Lords' amendments philosophically, all may yet be well. If, on the other hand, he hearkens to those who, for obvious reasons, are striving to convince him that he is being flouted and contemned, and that the years of strenuous labour he has devoted to the Bill are being brought to naught, we may witness the indefinite postponement of much-needed reforms. We can only trust that wise counsels will prevail, and that Mr. Burns will persevere in the firmness and moderation that during recent years have won for him a reputation for sound, solid state-craft.

California and Architectural Credentials.

They have done it, those practical and downright Americans. We shall never do it, but shall for ever keep on talking about it, and threatening to do it. They have convicted a man for practising as an architect without having first obtained a certificate from the State Board of Architecture. It was in California. They did not lynch him. Perhaps his offence was merely trifling and technical. We are hardly in position to judge of that, the language in which it is described being too severely technical to admit of exact interpretation in this country. He "had a shingle out." That was his offence. Then he had to have it out with the police-court president, who let him off with a nominal fine. That was last year. He appealed, and "while his appeal was pending, he took the required examination and secured a certificate." He took nothing else by that deal. possibly his tardy act of repentance may have prevented his being lynched or electrocuted. It did not win his appeal. Judge Willis, of the Superior Court, was inflexible. That is not surprising. We also have a Judge Willis, and should rather like to swop ours for theirs; for their Judge Willis's decision "establishes for the first time the right of the State Boards to prosecute architects not holding proper credentials" and yet daring to have a shingle out. The culprit's attorneys vainly sought his acquittal on the ground that "the Act calling for certificates is unconstitutional, and that it grants special privileges," including, it may be assumed, that of having a shingle out. In England this line of argument has hitherto prevailed, insomuch that the uncertificated might with impunity not only have a shingle out but build a cathedral in the Grand Manner. We are afraid, however, that this shingle instance from California is not likely to help forward the Registration movement very materially.

The Architect in Farce.

The ingenious authors of the A.A. plays have a serious (but no; the adjective is inappropriate; let us say formidable) rival in F. Anstey, the author of the new and diverting fantasy of "The Brass Bottle," now being performed nightly at the Vaudeville Theatre, London. The playwright has chosen, for good and sufficient reasons, to make his hero an architect. This gentleman, one Horace Ventimore, of the somewhat unappreciated firm of Ventimore and Pringle, has nothing better to do than to examine with leisurely curiosity a large brass bottle that has been bequeathed to him by an adventurous relative. He is curious to see what, if anything, is inside it, and he breaks the seal. In the act he releases a regulation Arabian Nights genie or Djin, who forthwith becomes his devoted and overwhelmingly obsequious slave. Is there anything that the architect earnestly desires? Well, for once in a way, he would like to experience the novel sensation of having a wealthy client. Bang! Wackerbath, a stupendously rich man, is precipitated through the window of the architect's office, and a commission for a £100,000 house is at once given. The result is the construction, on hey-presto but unhygienic principles, of a palace showing so much oriental feeling that the client is moved to complain of its slavish imitation of the Brighton Pavilion, while the architect points out that it is entirely lacking in modern conveniences, and that the sanitary arrangements are scandalously inadequate — no local authority, however lax, would dream of passing them. Irritated by these criticisms, the Djin causes the palace to melt away, and punishes the captious client by making him run on all fours and bark like a dog. Finally, the architect is threatened with annihilation unless he will consent to seal up again in the brass bottle the disappointed and disgusted Djin. It is a very merry little play. Purple Patch, the immortal of the A.A. annual, will have to look to his laurels. In this competition the first premiated design is that submitted by the Djin. The fact that it is impracticable does not weigh with the assessor.

Bricks and Victory.

Apparently Mr. Lloyd George has thought discretion the better part of valour. The Attorney General has announced, in the House of Commons, that "the Government doubted if it would be advisable to include clay as a mineral." As we are not of the Yellow Press, we do not claim full credit for this change of front; yet it is a curious (we do not say a significant) coincidence that the Attorney-General surrendered this point in the evening of the very day on which our emphatic protest appeared! The credit of the victory belongs chiefly to Mr. H. Greville Montgomery, M.P., who had organised opposition to such good purpose that he not only enlisted almost the entire Press of the country on his side, but had received promises of support from about fifty members of Parliament, and would certainly have challenged a division on his amendment to exempt brick clay from the operation of the clause. As to the question of whether clay is or is not a mineral, it is odd to note, as one of life's little ironies, that the very persons who have of late been most strenuously contending that clay is not a mineral were not so long ago trying hard to prove that it was a mineral. That was when they were claiming compensation for it when the land containing it was to be compulsorily acquired for railway construction. Although their position seems at first sight paradoxical, who shall say that they are not justified in both contentions? But, as old Kaspar said, it matters not how that may be—"it was a famous victory," and Mr. H. G. Montgomery deserves at least a life-membership of the honourable "Association of Cemented Bricks," if that select organisation is still in existence. Jubilation over this victory, however, does not render us oblivious to the fact that there are other battles to fight. The price of bricks is likely to be affected even more seriously by the enhanced price of coal than it would have been by the preposterous tax on clay. The exemption of other materials is recorded on p. 266.

THE OLD BATH CONTROVERSY.

The controversy over the proposed extension of the Grand Pump Room Hotel at Bath is being revived. The proposed extension, it will be remembered, necessitated the demolition of the colonnade on one side of the street, thus destroying a vista that is characteristic of the best period of Bath architecture. Messrs. Waring, who are closely interested in the project, have stated their views to a representative of the London "Standard." "The question which has arisen," Mr. Waring is reported as having said, "is one which profoundly interests me from many points of view. As proprietors of the hotel the development of our scheme of extension has been delayed by the agitation which has arisen to spare Bath Street. We have been pained by an unwilling association with proposals which involved the destruction of a piece of architecture which was held in high esteem not only by the citizens of Bath, but by a large and influential body of architects and antiquarians representing the best artistic sentiment of the day. As you are aware, the blame has not been directed at my firm, but at the members of the corporation of Bath for sanctioning the plans, and we were really under no obligation to modify the plans in the least. These plans, of course, gave us the maximum space for extending the hotel by the addition of the largest number and biggest possible rooms, but we felt obliged notwithstanding the loss, to bow to the wave of feeling which has been evoked, at least to the extent of deferring the demolition of the colonnaded houses until the question had been thoroughly debated. The matter, however, has not progressed in the least, so we have gone to an eminent architect, whose name carries great weight in the profession, and he has prepared a design which retains the arcade which is the destinctive feature of Bath Street, and the essential characteristics of the Georgian facade, by means of a coupled colonnade, out of which spring arches supporting the walls of the upper floors of the buildings. The introduction of a double colonnade was necessary to sustain the extra weight of the new superstructure." The architect referred to was Mr. R. Frank Atkinson, F.R.I.B.A.

Looking at the design then produced by Mr. Waring, a feature of which is that extra top light is provided for the new corporation baths, on the ground floor, and comparing it with the elevation which had been submitted and approved by the Bath Council, the "Standard" representative pointed out the loss of space involved in the new plan by the setting back of the top three floors, so as not to interfere with the light to the opposite houses. Mr. Waring said that this meant a loss in the cubic capacity of the block throughout the length of the street, but a more serious consideration was the additional cost of building an arcaded street as compared with the conventional pattern. He was prepared, notwithstanding, to make the sacrifice in both directions in the public interest, provided the corporation would cooperate with him; and in doing this he felt there could no longer be any justification for the charges of vandalism or the imputation that he was on the side of those who cared nothing for the beauty or for the historical associations of the city of Bath.

"Throughout all that has been said and written on the subject," Mr. Waring complained, "not one practical suggestion for treating Bath Street so as to retain its beauty and harmony has been put forward, and it is essentially a matter for the municipality."

The Old Bath Preservation Society contend that the whole plan of Bath Street, with its well-balanced colonnade on either side, should be maintained in its entirety, and that any attempt to mutilate or deface any portion of the unique thoroughfare must be strenuously resisted. It is therefore very doubtful whether the latest suggested solution of the difficulty will be accepted.

Architects of the Day.--V.

Mr. D. H. Burnham, of Chicago.

Daniel Hudson Burnham, probably now the foremost of American architects, was born at Henderson, Jefferson County, New York, September 4th, 1846. Hs is a grandson of Samuel Hopkins, of Vermont, who made himself famous in the war for American Independence. In the year 1855 his family moved to Chicago, which was then a mere border town of a few thousand inhabitants. In the year 1864 he commenced his architectural studies in Massachusetts; and in 1867 returned to Chicago and entered the office of Messrs. Loring and Jenney, where he received his first eighteen months' professional experience. In October, 1871, he was engaged by Messrs. Coster, Drake, and Wright, in the rebuilding of the city which followed the great fire. Those were not days of monumental city planning, and the refinements of life are not the first things to be thought about after a great catastrophe. The buildings first erected were only a stage in advance of those which had been just burned down—the advance was in engineering rather than architecture; the buildings were better designed as regards construction, and perhaps also as to means of escape in case of fire, but it was not until some years later—one might say at least not until after the Centennial Exposition of 1876, held at Philadelphia—that the idea of building beautifully—for effect as well as strength—took hold of the people of Chicago.

In 1873 Mr. Burnham and John Wellborn Root commenced the practice of architecture under the firm name of Burnham and Root. An examination of their very early work reveals only undeveloped—but developing artistic ability, and their later work, such as the "Chicago Herald" building and the Monadonock office building, the twenty-storey Masonic Temple, and the building of the Women's Christian Temperance Union, all of which designs were well in advance of what was being done by their contemporaries, though proving artistic perception in their designers, were all expressed through the medium of a style little suited to the orderly and rather Latin taste of Mr. Burnham. The Monadonock, though a plain commercial structure—absolutely unornamented—attracted much attention on the part of the public and "the profession" alike, because of its good proportions and excellent lines, and may be said to be the first evidence of classic taste in the design of office building structures.

The earliest architectural development of Chicago is centred in the work of these two men, who "laid to" with the optimistic spirit so well expressed in Kipling's lines:—

> "Ye've left a glimmer still to cheer the man
> —the arrtifex!
> *That* holds, in spite o' knock and scale,
> o' friction, waste and slip,
> An' by that light—now mark my word—
> we'll build the Perfect Ship."

MR. DANIEL HUDSON BURNHAM OF CHICAGO.

Mr. Burnham has attained a world-wide renown for his great town-planning work in America, notably in the schemes he has prepared for the cities of Washington, Chicago, and San Francisco.

The beginnings of modern American architecture may be said to have taken place when in September, 1890, Messrs. Burnham and Root were appointed "constructing architects of the Columbian Exposition," and a month later Mr. Burnham was made Chief of Construction. The following January Mr. Root, who had been studying the design while Mr. Burnham was busy organising the construction department, died, and Mr. Burnham was appointed Director of Works, with sole responsibility for the artistic and practical result of the whole work connected with the buildings and grounds. It was due principally, if not entirely, to his efforts during the period of inception, that the arrangement was made to place a Board of Architects in control of the scheme and assign the separate buildings to different architects.

This Board of Architects included most of the conspicuous artistic talent of the day—two of its members, the late Richard Morris Hunt and the late Charles Follen McKim were the only Americans who have ever been presented the Royal Gold Medal of the R.I.B.A.—McKim, with his partners Mead and White, Messrs. Peabody and Sterns, the late Dankmar Adler and Mr. Louis Sullivan, Mr. Geo. B. Post, the late Henry Van Brunt, and Mr. Howe, the late W. L. B. Jenney, Mr. Solon, S. Beman, and the late Charles Bowler Atwood. The last-mentioned was chosen by Mr. Burnham to become his chief assistant, and later taken into partnership. Mr. Ernest Graham, another assistant, renowned for executive ability, was made Assistant Director of Works, and afterwards a partner. In thus drawing about him the ablest and most influential members of his own profession and putting in their hands the check upon his own ideas and undertakings, Mr. Burnham displayed a diplomatic skill for which he has always since been distinguished—not only among architects, but when dealing with the great "captains of industry," "masters of finance," "railway magnates," and able politicians with whom he has been in constant contact since the days when the Exposition was first projected. To an acquaintance he was once described, by a late United States Senator, as "a great artist, a great engineer, a great organiser, and a great diplomat." When this was repeated to an engineer who had worked with Mr. Burnham during the Exposition days, the reply was even more pleasantly interesting: "He has a cold head and a warm heart, which never mix, but are always in touch with each other. In meeting him I always felt a thin sheet of ice was between us, but a generous man on the other side." These are the sort of things one sometimes hears said of a prominent man after his demise—and then usually by his personal friends—but the above comments were made by men who knew Mr. Burnham in business only, to another who they knew had at that time met him but once.

The reason the better characteristics of prominent men are not more frequently mentioned—except, of course, during after-dinner speeches—is doubtless due to fear on the part of their acquaintances of hurting the susceptibilities of the subject. But when that subject is separated from the writer by a distance of about one-quarter round the world, one may put it in its true perspective with sufficient propriety.

The Columbian Exposition brought together not only the best architects, but also sculptors, painters, engineers, "landscape architects," and workers from all over the United States. Perhaps no other Exposition anywhere ever aroused such widespread interest, such sectional pride, or such local enthusiasm. This was a monument to commemorate the four-hundredth anniversary of the discovery of America, a memorial to the peaceful progress of the American people, a milestone marking the course of development of the great "Middle West," the "Coming-out reception of Chicago."

One of the most disastrous conflagrations of modern times had swept the city of

Chicago out of all but existence only twenty-one years before, and its rebuilding had gone on amidst national financial panic, wild struggles with a semi-organised and desperate anarchy, which was insidiously sapping the mind and energy of local labour, and in the face of lack of faith in its enterprises on the part of investors in the Eastern States. Chicago was spoken of as the "city of slaughter-houses," of "pork packers," "the city of magnificent prairies"—alluding to the numerous spaces unbuilt upon—and otherwise generally slurred. But in 1893, when the Columbian Exposition was thrown open to the world, everybody who could journeyed thither, and the real Chicago began to be known. Her enterprise, her ambition—to be larger than London and more beautiful than Paris—her great optimism and her financial solidity, became subjects of world-wide discussion. And to-day in Europe, whenever Chicago is mentioned, the great "World's Fair" becomes a topic of conversation. The immediate influence which the Exposition had upon the architecture of the country is too well known to require more than mention of it here. As the mainspring—we might say—of the effects produced by that Exposition, the name of Burnham is permanently associated with it—with one of the greatest architectural achievements of modern times. It is worthy of note that aside from his mere honorarium, which did not refund his expenses, the Director of Works did not profit financially from any work connected with the Exposition, but devoted his time to the undertaking as though he had been a paid servant of the Exposition Company. When the buildings of the Exposition were completed a public dinner was tendered to the chief architect in New York, given directly to the man whose genius had been the guiding force, and as a grateful recognition of his services. At this dinner were gathered as hosts a notable company of men highest in all the arts. On no occasion previously had a member of the artistic profession been so honoured, publicly, in the United States.

Harvard University recognised the importance of his labours by conferring upon him the honorary degree of Ph.D. The following year he was elected President of the American Institute of Architects, and was re-elected in 1895, and following his second term was elected a Director of the Institute for three years.

The Exposition over, Mr. Burnham returned to his large private practice, already one of America's most distinguished architects. But still greater tasks to perform for his profession and his country awaited him in the not distant future. For a few years continuously, and more or less ever since, he has been obliged to devote himself principally to conducting the architectural work of such commercial undertakings as the Ellicott Square buildings, Buffalo, N.Y., Fisher Building and Great Northern Hotel annex in Chicago, Youngstown (Ohio) Bank, the Illinois Trust Company's Building, Chicago (Fig. 1), the Pennsylvania Railroad Station at Columbus, Ohio, the Marshall Field Retail Stores, the Land Title and Trust Company's buildings at Philadelphia, the Majestic Building at Detroit, the Traction Building at Cincinnati, the Union Trust Building at Pittsburg, the Continental Building at Baltimore, the Mills Building at San Francisco, the "Flat Iron" Building, New York (Fig. 2), the Frick Building and the Pennsylvania Railroad Station at Pittsburg (Fig. 3), the First National Bank of Chicago (Fig. 4), Keith's Theatre and the Wanamaker Stores at Philadelphia, the Real Estate Exchange, Chicago, the Wanamaker Store at New York, the Ford Building at Detroit, the Commercial National Bank at Chicago (Fig. 11), the First National Bank of Pittsburg (Fig. 5), the People's Gas Company Building at Chicago (Fig. 6), and Gimbel Brothers' Store in New York (Fig. 7), the two latter being at present in course of construction. His first columnar design for the Selfridge Building in Oxford Street was perhaps the finest design that has yet been made for a commercial structure, and a subsequent re-study—made after a re-study of the original design had been made by another architect in London—was shown two years ago at the Royal Academy by means of a large beautifully rendered water-colour drawn by Mr. Lawrence Buck, of Chicago (Fig. 8). This has been somewhat modified in execution.

It is probable, however, that with the exception of the bank buildings solely devoted to banking, none of these great commercial structures appeal very strongly to Mr. Burnham's æsthetic sense. His great design for the Field Columbian Museum at Chicago seems to be more to his feeling for architecture. It may be classed with the New York and Boston Public Libraries among the very best of American architectural productions. Another work almost as fine and equally important is the great Union Station at Washington, D.C. (illustrated in our issue for September 9, 1908), which arose out of Mr. Burnham's action as a patriotic American citizen in asking a railroad company to give up certain of its rights in the interests of the beauty of the nation's capital, in the planning of which Mr. Burnham has taken a part second only to Major L'Enfant, who made the original plan.

Plan of Washington.

In March, 1901, the Senate of the United States "Resolved that the Committee on the District of Columbia be, and it is hereby, directed to consider the subject and report to the Senate plans for the development and improvement of the entire park system of the District of Columbia. For the purpose of preparing such plans, the Committee may sit during recess of Congress, and may secure the services of such experts as may be found necessary for a proper consideration of the subject," etc.

About a fortnight later the sub-committee having the matter in charge met the representatives of the American Institute of Architects and agreed to the proposition of the latter that Mr. Burnham and Mr. F. L. Olmstead, jun., be employed as experts, with power to add to their number. These gentlemen accepted the task, and subsequently invited Mr. McKim and Augustus St. Gaudens to act with them. Mr. Burnham was elected Chairman of this Expert Committee.

At the call of their professional brethren, and at the request of this committee, these men virtually put aside their large and profitable private work, and for nearly a year devoted their time, their experience, and their technical training to the service of the nation. These sacrifices were made without pecuniary reward, and at a time when success and fame were already secure.

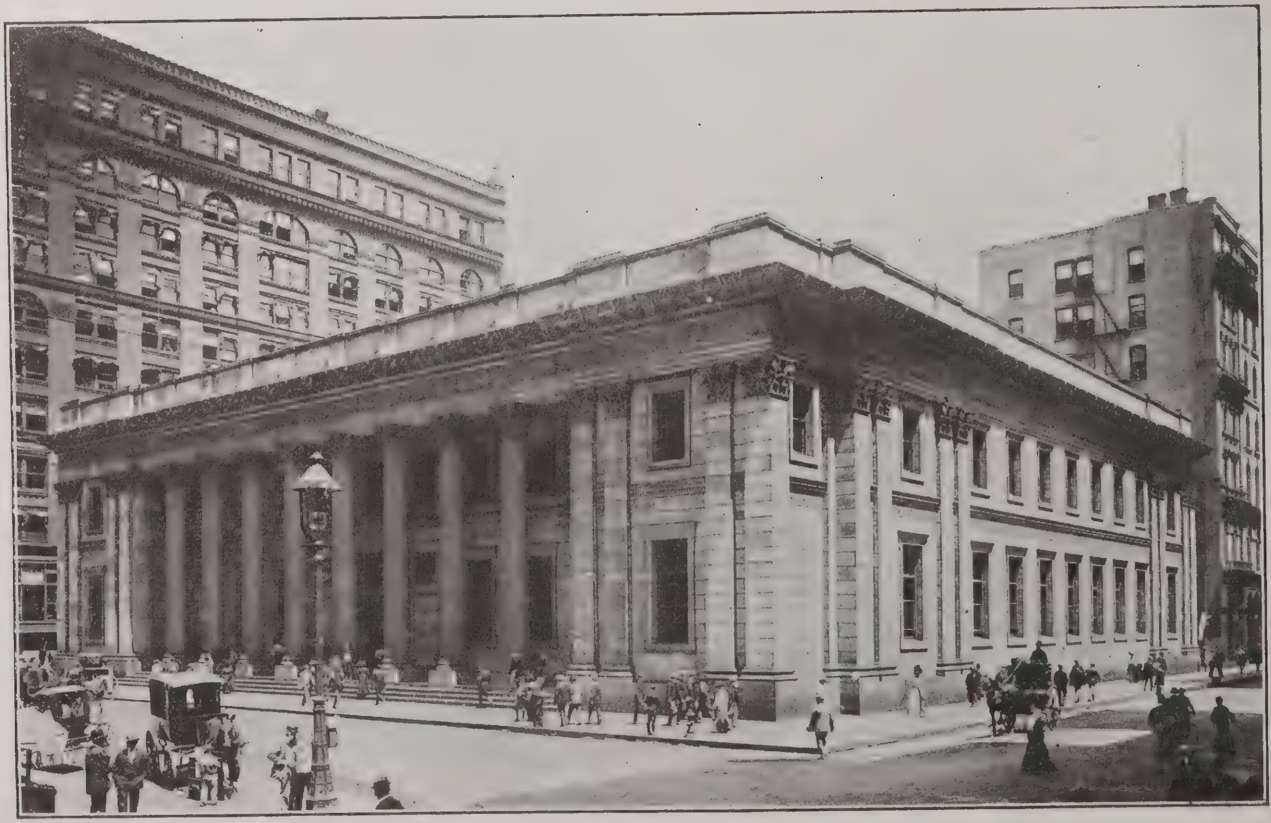

FIG. I.—THE ILLINOIS TRUST COMPANY'S BUILDING, CHICAGO. D. H. BURNHAM AND CO., ARCHITECTS.

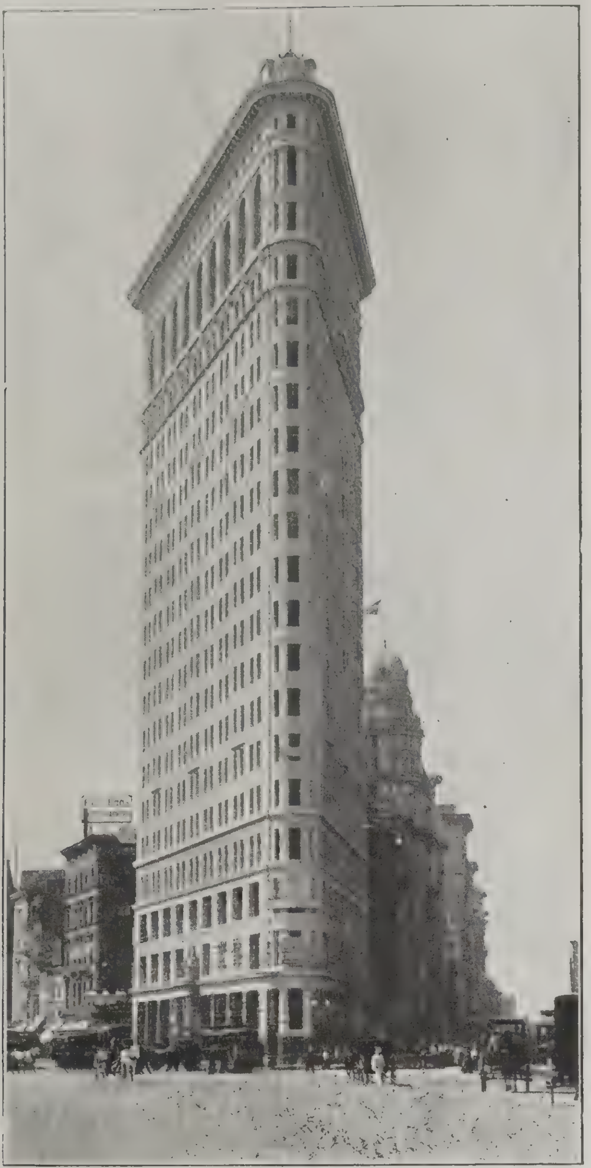

FIG. 2.—THE "FLAT-IRON" BUILDING NEW YORK. D. H. BURNHAM AND CO., ARCHITECTS

The work done by this committee resulted in the adoption of a plan following closely the original plan made by Major Pierre Charles L'Enfant in 1791, its object being to prepare for the City of Washington such a plan as should enable future development to proceed along the lines originally planned—namely, the treatment of the city as a work of civic art—and to develop the outlying parks as portions of a single well-considered system.

After detailed examination of the topographical features of the District of Columbia, the Commission drew up preliminary plans. They were then forced to the conclusion that an adequate treatment of the park system depended upon the exclusion of the Baltimore and Potomac Railroad from public grounds, so as to allow that dignified approach to the Capitol for which the Mall was originally designed. The occupation of the Mall by the railroad dated back to 1872, when it was granted by the then local government of the District of Columbia and confirmed by Congress. The railroad therefore held the right to use the property by a title good in law and equity, and by virtue of a later Act of Congress the railroad space had been enlarged in consideration of the surrender of street trackage and the proposed elevation of tracks in the City of Washington.

Mr. Burnham was architect of the Pennsylvania Railroad's new station at Pittsburg, and he had also drawn for the Pennsylvania Railroad the preliminary plans for the then proposed new Baltimore and Potomac station in the Mall site. He went to the President of the Pennsylvania and asked that the station be built on the south side of the Mall and lands adjoining. The architectural and other advantages of the proposed site were set forth with such vigour as to command serious consideration.

During the summer (1901), Mr. Burnham, with other members of the Commission, made a brief trip to Europe, and while here—in London—President Cassatt, of the Pennsylvania, announced to him his willingness to consider the question, not of moving the station to the south side of the Mall, but of withdrawing altogether from that region and uniting with the Baltimore and Ohio Railroad Company in the erection of a Union Station, provided suitable legislation were secured to make compensation for the increased expense such a change would involve, and provided, also, that the approaches to the new site be made worthy of the building the railroads proposed to erect.

The Commission proposed a site on Massachusetts Avenue, which was finally accepted by the railroad companies. Mr. Burnham was charged with the designing of the new station, which was intended to be superior to any structure ever erected for railway purposes.

It is seldom, even in these days of town planning—or talk of it!—for an architect to be charged with the planning of a city, but to have planned two or three capital cities surely must be a record. Such, however, has fallen to the lot of the subject of this article.

The Plan of Manila, Philippine Islands.

In 1898 differences between the United States and Spain resulted in the acquisition of the Philippine Islands by the former. No sooner had these islands come into the possession of the United States than the War Department set about adapting the capital city of Manila to the changed conditions brought about by the influx of Americans who are accustomed to better conditions of living than had prevailed in the Philippines. In 1905 Mr. Burnham, assisted by Mr. Pierce Anderson, was instructed by the Secretary of War (the Honourable William H. Taft, now President of the United States) to visit the city of Manila and prepare a report and plans for the future improvement of the city and harbour. The report was completed on June 28th, 1905. It deals briefly with the history and general conditions prevailing, political, topographical, building, and population. It was accompanied by two plans—the plan of Manila, showing proposed improvements, and plan of Manila Bay, showing a proposed sea boulevard.

The aim of the proposed plan is stated to provide:—

(1) Development of water front and location of parks and parkways, so as to give proper means of recreation to every quarter of the city.

(2) The street system, securing direct and easy communication from every part of the city to every other part.

(3) Location of building sites for various activities.

(4) Development of waterways for transportation.

(5) Summer resorts.

The proposed development of the water front includes the construction of an ocean boulevard or continuous parkway along the bay to the south side of the city; planted drives along the shores of the river, which runs, approximately, east and west, and divides the city into halves; a new Luneta—or island pleasure park—formed upon made ground in the shallow part of the harbour, parks, parkways, playgrounds, gardens, and fountains.

The street system deals with the sanitation of the old quarter, and attempts to connect it with the ideal plan proposed for the future extension of the city that the existing streets, bridges and harbour works may be left substantially unchanged, and no demolition of buildings or changes in the direction of streets are suggested, except such as were imperatively called for to relieve present congestion and provide for the future needs of traffic. It also considers carefully the advantages and disadvantages connected with the old city walls, and recommends their retention, suggesting the cutting of arches through same to allow the extension of streets. It also proposes that the old moat shall be filled in, and treats scientifically the problem of the width of streets. Of the street system in the new quarter, it provides:

Avoidance of either north or south or east and west orientation of building sites.

Fan-shaped grouping of radiating streets.

Diagonal arteries allowing direct communication from any city district to any other.

The avoiding of north and south, or east and west orientation of streets allows each of the four sides of the house to have the advantage of direct sunlight at some time during the day, with consequent gain in ventilation and sanitation.

The location of building sites for various activities is discussed in the report in groups consisting of the Government or National group, the Court House or Halls of Justice, the group comprising the Library, Museum, and Exposition buildings (which might be

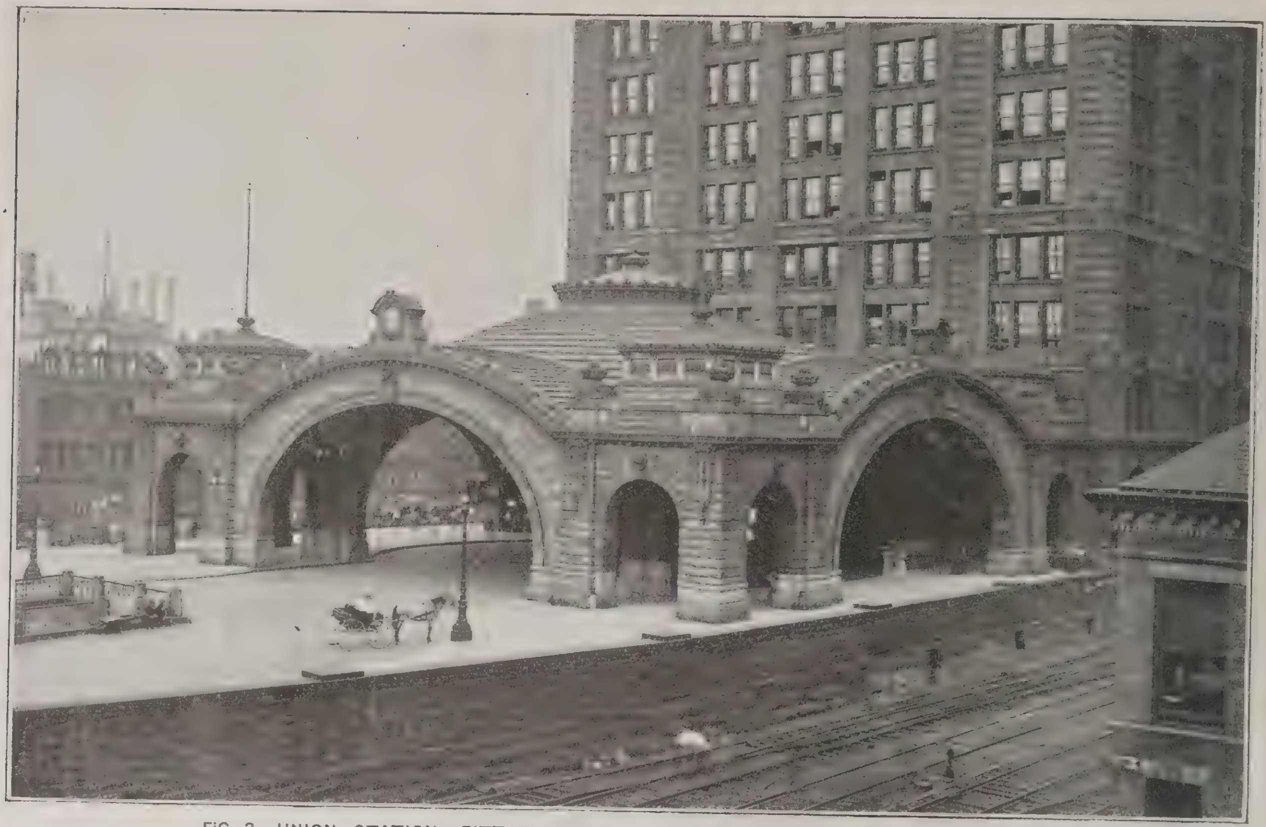

FIG. 3.—UNION STATION, PITTSBURG, PA. D. H. BURNHAM AND CO., ARCHITECTS.

termed the group of Public Instruction), the Post Office, the Railway Station and approaches, the Municipal group, the official Residences, the hotels, the Casino, public baths, and boat clubs (public recreation), the school centres, and the charitable institutions. The Development of Water Transportation considers additional harbour facilities, *esteros*—narrow canals—ramifying throughout Manila, and the establishment of open quays along the riverside.

The climate of Manila made it necessary to give special consideration to the subject of establishing accessible summer resorts on high ground, and led to the interesting study of the suburban districts.

Not the least interesting point in connection with this report was the recommendation that buildings should be constructed of reinforced concrete for the purpose of resisting earthquake shocks.

Plan of Bagnio, the Summer Capital of the Philippine Islands.

The necessity of providing for a summer capital for the government of the Philippines led to the creation on the hills of Bagnio, about one hundred miles from Manila, of a city laid out on a plan similar to that made by L'Enfant for the city of Washington, in that it provides for such public buildings as may be needed for Government offices, for the service of the city itself, and for the healthfulness, convenience, and recreation of the people, and all these functions are so arranged as to make a unified and orderly city.

Plan of San Francisco.

This brilliant monumental study in town planning was made by Mr. Burnham, assisted by Mr. Edward H. Bennett, in the year 1904, for the Association for the Improvement and adornment of San Francisco. Unlike Washington, Manila, and Bagnio, San Francisco is not a capital city, but a great seaport commercial town. It is consequently less monumental, and possesses fewer centres of interest than those cities. The plan prepared by Messrs. Burnham and Bennett is remarkable, principally as showing how it would be possible to convert the inconvenient and uninteresting plan of San Francisco into one that would be both convenient and beautiful by cutting a few diagonal avenues and widening a few streets. The increment in property value throughout the city alone would well justify the necessary expenditure for nearly all the work proposed. The sketches were most interesting, and the treatment of focal centres, as Telegraph Hill (Fig. 10), and the Athenæum looking to the sea (Fig. 11), are most valuable compositions and suggestions. The charming and domestic side of the design was suggested by the treatment for existing street frontages, and the strength of the planner was apparent in the plan of the new centre for the city.

The Plan of Chicago.

The Columbian Exposition of 1893 was the beginning in our days and in the United States of the orderly arrangement of extensive public grounds and buildings. It stamped itself indelibly upon the memories of all who saw it, and it continued to live in the memory of the people and dwell upon the minds of the architects who had created it. To the people of Chicago it called for some permanent memorial of itself. It suggested the improvement of the water front of Chicago. The year following the Exposition, the Park Commissioners proposed the improvement of the lake front from the site of the Exposition—Jackson Park—to Grant Park, a distance of about seven miles. A plan was prepared for the Commissioners, and subsequently exhibited at a dinner given by the Commercial Club. Many of the business men who were present at this gathering were emphatic in expressing their conviction that the scheme would be of the greatest value to Chicago and should be adopted and carried into execution. This was the inception of the project for a park out in the lake, having a lagoon between it and the shore, and for several years Mr. Burnham and his assistants worked along developing the design.

In 1906 the Merchants' Club arranged for the preparation of a complete project for the future development of Chicago. The following year this club merged with the Commercial Club under the name of the latter, and the work has continued under the auspices of that association. As proving the intensity of interest in this plan, it must be noted that the committee met several hundred times during the progress of the work; during many weeks meetings took place daily, and throughout the entire time no week passed without at least one meeting.

In perparing this enormous design the Commercial Club undertook the following task:—

In preparing this enormous design the physical conditions of Chicago as they now exist.

Second, to discover how those conditions may be improved.

Third, to record such conclusions in the shape of drawings and texts which shall become a guide for the future development of Chicago.

It is quite impossible to go into even the most general details of a project so vast as this. If the idea were proposed for any other city on earth it might be put down as a most extravagant dream. But with Chicago nothing is impossible. Anything that is really worth doing is probable of execution. The people of Chicago are so accustomed to results beyond their most sanguine predictions that they hope easily, believe easily, and accomplish easily. They are a people trained in intense commercial activity, who understand that great success cannot be attained unless the special work in hand be entrusted to those best fitted to undertake it. It is the habit of Chicago's business men to select some one to take the responsibility in every important enterprise, and to give to that person earnest, loyal, and steadfast support. In the preparation of this plan, which is perhaps the most gigantic work ever placed in the hands of an architect, Mr. Burnham was selected to take the principal responsibility. The plan, which as a scientific and artistic treatment of the city as a whole is unrivalled by that of any existing city in the world, is now complete, and with the many beautiful drawings of details, has been published this year in a magnificent quarto volume by the Commercial Club of Chicago. The conception of this plan of itself—had he done nothing else—is enough to give to its author a permanent place among the greatest architects of his or any other century. We have, however, an abundance of monumental works by him which might be regarded as details of this plan, and anyone of these "details" would be sufficient to make a reputation for most architects.

In the above notes it has been attempted to gather together in brief review the more important works of this architect; more than that it is impracticable to do in these pages—it is impossible in an article as short as this to do so much as even give a list of the numerous houses, many of which are remarkable for charm and dignity, or of the gardens, park shelters, small club-houses, etc., built from his designs; nor to mention more than the best known of his many good deeds done in behalf of his art, his confrères, and of the younger men. It is almost needless to recall his famous letter to the secretary of the Treasury—Carlisle—during the period of his Presidency of the American Institute of Architects, or the importance of his influence in bringing about reforms in the office of the Supervising Architect of the United States Treasury Department, and placing a competent architect in charge of the designing of the smaller post offices, custom houses, etc.

Two things which he has done are, however, especially worthy of note and grateful remembrance: First, by his fellow citizens, as regards the important duties he has performed, *as a citizen*, in giving gratuitously his time and thought to the planning of cities in order that posterity may enjoy advantages beyond those of the present generation—a labour which somebody ought to perform for nearly every city, and a task which Mr. Burnham has undertaken in the instances mentioned. Second, by good sportsmen, the world over, who love fair play in all things, and by that numerous band of men who are to be classed with,

"Full many a gem of purest ray serene," whose worth is never generally known, but who can applaud the breadth of character in a man who brings to light some of their number by sharing the credit for his work with those of his subordinate co-workers who are his principal assistants upon a given work. It is due to this generous trait that the "and Co." ordinarily appears after Mr. Burnham's name. It is, therefore, in a sense not a commercial title, and is due honour as well as respect, in this unique case—it relieves the necessity of an explanation of the association, upon a design, of a number of artists and engineers, most of whom are in his employ, but whose identity he chooses to reveal rather than conceal, and whose names he has coupled with his own. He is always the real designer of the work which bears his name; and except in those instances when the name of the assistant is fully acknowledged, may be always safely regarded as the sole architect.

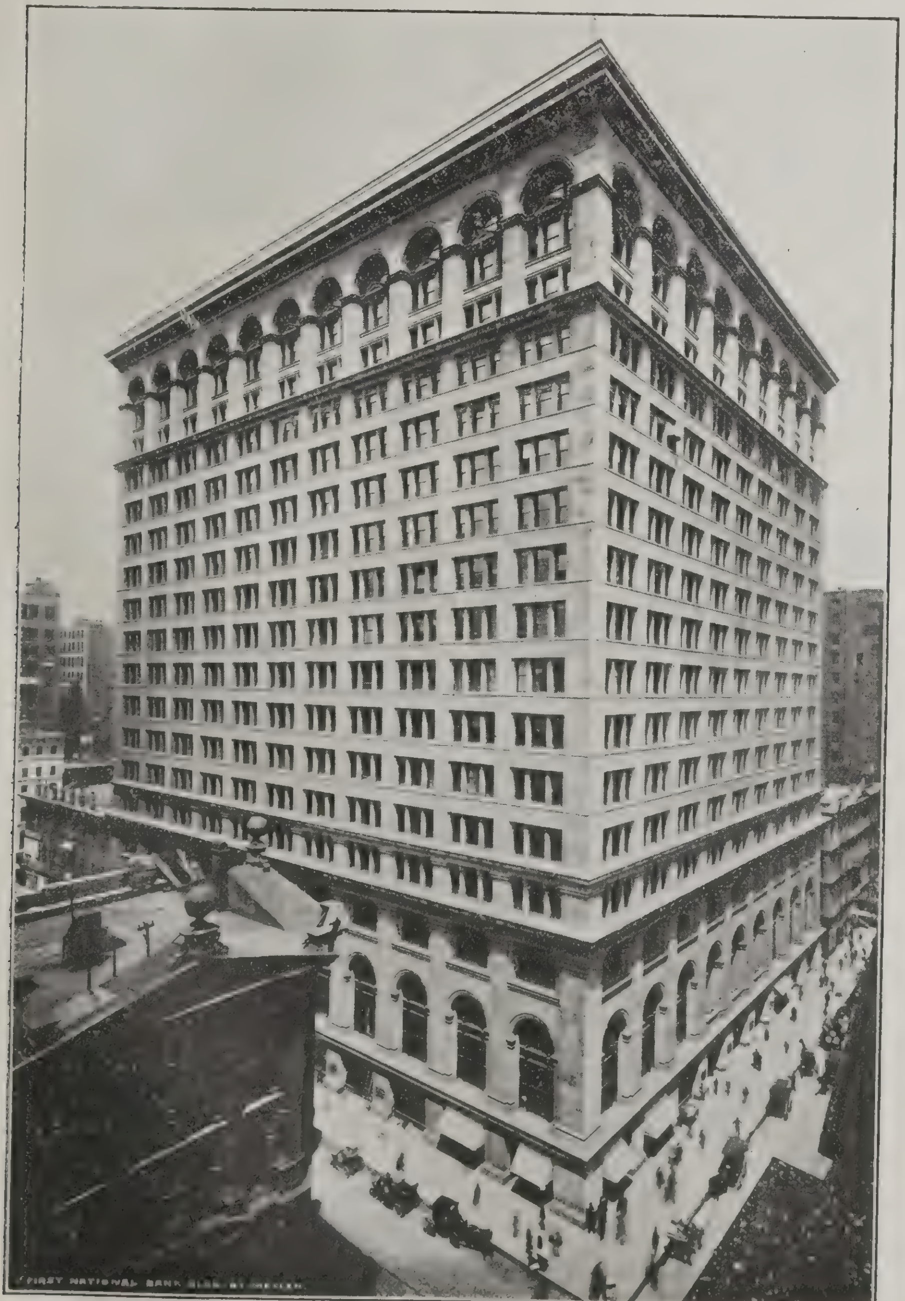

FIG. 4.—FIRST NATIONAL BANK, CHICAGO.

SOME PRINCIPLES OF RESTORATION.

Since, whenever a cathedral is restored, protests and controversies are sure to arise, it may be worth while, says the writer of a leading article in the "Times," to consider what principles ought to be followed in the restoration or repair of ancient buildings. The first and the most frequently ignored is this, that any copy of a fine old building or of any expressive part of it is sure to be a dull absurdity. A great Gothic Cathedral is a work of art, just like a great picture or statue, and a work of art produced in conditions and expressing a state of mind which now no longer exists. It was produced, of course not by one man, but by many; but that fact makes it no easier to imitate. Gothic architecture was a growth, not a game, and an imitation Gothic building is as little like a real one as an imitation tree is like a real one; that is to say, it has a superficial resemblance, but lacks all the qualities which make the original beautiful and interesting. This is not mere theorizing, it is a fact proved by all the imitation Gothic buildings and all the purely imitative restorations which have been produced since Horace Walpole first started the Gothic revival with his ugly toy at Strawberry Hill. Nothing proves it more thoroughly than the imitation Gothic sculpture and stained-glass windows with which so many cathedrals both in England and France have been defaced. The windows are more fiercely ugly than the sculpture; but both have the inevitable dulness of imitation so close that it implies a complete lack of inspiration.

The objection to this kind of restoration is not that it is modern, as many people suppose. Every great work of art is modern when it is produced; and no doubt the greatest look their best when they are new and just what the artists meant them to be. The objection is that these imitations are neither modern nor ancient. They have not the character of any age or the stamp of any individuality. The extreme opponents of restoration seem to hold that we have no right to touch a cathedral except to prevent it from tumbling down. But that view implies an utter despair of all modern art, and it is not a view that has been held in any age of living art. The builders of each successive age of Gothic architecture were quite ready to take liberties with the work of their predecessors. But they were not ready to imitate that work so soon as it belonged to the past. Nor were they afraid of any incongruity between the past and the present. Even when Gothic architecture was superseded by the Renaissance, the Renaissance architects continued to make additions to Gothic churches, and many of these can only look incongruous to a pedantic eye. What does look incongruous is the mixture of imitative with original work, and this is an incongruity which has been reserved for the timid purism of modern times. Perhaps the best we can do, where the fronts and porches of our cathedrals lack their original sculpture or only keep a few broken and battered remains of it, is to leave them alone and to make only such structural repairs as are absolutely necessary. The next best is to supply them with sculpture designed entirely by living artists, and without any attempt to imitate old work. Such sculpture has at least the chance of being expressive. But the sculpture which has no aim except to avoid incongruity is sure to have the worst incongruity of all—the incongruity of death compared with life. It is the same with all ornament that is a mere joyless imitation of originals that were produced with joy and conviction. With these dicta of the "Times" writer few architects will disagree.

The architects of Westminster Cathedral are at present engaged on the design of a mosaic of Joan of Arc, which is the outcome of an idea originated by the Catholic Women's League.

Societies and Institutions.

University of London.

An Appointments Board has been constituted by the University of London. The terms of reference to the Board are "to assist graduates and students of the University in obtaining appointments, and to coordinate and supplement the work done by the schools and institutions of the University with this object." It is hoped that, through the medium of the Press, the objects of the Board may be brought to the notice of graduates as well as of those who are able and willing to assist in furthering the work of the Board, the aim of which is to encourage the selection of University men for all posts in the work of which the possession of a University training on scientific methods is an advantage. They wish to assist graduates to find employment, and to assist employers to find, in the University ranks, suitable men for vacancies. It would assist the Board if, whenever readers know of any vacant appointments suitable for University men, they would communicate with the Secretary of the Board, so that he may put forward selected candidates. In this way the work of the Board as an employment exchange would be greatly helped.

University Extension Guild Lectures on Architecture.

Mr. Banister Fletcher, F.R.I.B.A., commenced a course of 24 University Extension lectures on "Ancient Architecture," at the British Museum, by permission of the trustees, on Tuesday, October 5th. The lectures will deal with Egyptian, Assyrian, Persian, Greek, Roman, Early Christian, and Byzantine Architecture, and will be fully illustrated with lantern slides and photographs. The objects in the Museum will be explained in the class held after the lecture. The course is continued every Tuesday afternoon, at 4.30.

Sheffield Society of Architects and Surveyors.

The twenty-second annual report has been issued of the Sheffield Society of Architects and Surveyors, which was founded in 1886, and was in 1889 the first provincial society to avail itself of the scheme of alliance with the Royal Institute of British Architects. The meetings of the society are held at the University, Western Bank, and its library is placed in the room allocated to the Department of Architecture at the university. During the twelvemonth dealt with in the report, one hon. member, one fellow, and nine students were elected, and three associates, one student, and one lay member having resigned, the membership now stands as follows: Honorary members, two; fellows, thirty-nine; associates, fifty-one; students, twenty; lay members, seventeen; total, 129, as compared with 123 for the previous year. During the session, several members of the council were invited to join a committee appointed by the Chamber of Commerce to consider the new building by-laws and regulations.

Society of Engineers.

The fourth vacation visit of the present session took place on Wednesday, September 22nd, when, by the courtesy of Messrs. Wm. Hill and Son, facilities were given for a party of members of the Society and their friends to inspect the organ building works of that firm at Camden Road, Islington, N. Wm. Hill and Son are the oldest firm of organ builders in this country, being descended from John Snetzler, whose business, founded in 1755, passed into the possession of Thomas Eliot, and then to his son-in-law, William Hill, the distinguished organ builder, in the earlier part of the nineteenth century. For nearly a hundred years, therefore, the business has been in the Hill family. Many of the principal organs in the United Kingdom and the Colonies have been built by the Hills, including some of the most celebrated instruments in the cathedral and parish churches of the country, besides those in secular buildings. The present works in York Road, built in 1873, consist of offices, a large hall, 80ft. by 40ft. (in which the organs are erected after the different parts have been prepared), and an engineering shop where, in addition to the ordinary work connected with organ building, the firm make their own hydraulic engines for organ blowing. Outside the workshops is an extensive timber yard, where a large stock of hard and soft woods is stacked and kept to mature. The machinery connected with the works is driven by a 30-h.p. gas engine.

Northampton Polytechnic Institute.

The new building of this Institute, which was in process of erection at this time last year, has since been finished, and is now available for the extending work of the Institute. It provides a much needed enlargement of the mechanical engineering workshop and of the mechanical laboratory, besides two entirely new power laboratories. This increased accommodation will materially assist the work of the mechanical engineering department, as already established, as well as the new departure in the direction of aeronautical engineering, which is being made in the coming session. In addition to the above, the extension provides a new classroom capable of accommodating 280 students and 13 other class-rooms of various sizes for the numerous classes of the Institute in all departments. Besides the new classes in aeronautical engineering in the mechanical engineering department, there will be in the electrical engineering department a new class on the testing of electrical plant conducted by Dr. C. V. Drysdale, in place of the advanced class on electrical instruments, which will not be held this session. There will also be a new class on electrical engineering quantities and estimates, conducted by Mr. E. Kilburn Scott. Developments in various directions have been made or are in contemplation.

Municipal School of Art, Birmingham.

The programme for session 1909-10 of the Central School of the Birmingham Municipal School of Art includes particulars of the Day School of Architecture, of which the object is "to provide architectural students in the Midlands with a thorough training in all the branches of their profession, and to prepare them for the examination of the Royal Institute of British Architects." The school course extends over four or five years. The first two years are spent at day classes, and are intended to take the place of the first two years of articled pupilage. The latter two or three years are spent at evening classes, and run concurrently with articled pupilage. The teaching staff is as follows: General director, J. L. Ball; assistant director and lecturer in design, E. F. Reynolds (Soane Medallist, 1903); lecturer in history, W. H. Bidlake, M.A., A.R.I.B.A. (Pugin Scholar, 1885); lecturer in physics, etc., F. B. Andrews, A.R.I.B.A.; assistant, John B. Surman, A.R.I.B.A.

Glasgow and West of Scotland Technical College.

The Calendar for the one hundred and fourteenth session (1909-10) of the Glasgow and West of Scotland Technical College includes, very prominently, architectural and building interests, there being special committees on architecture, on new buildings, and on plumbing classes, besides the joint-committee on the Glasgow School of Architecture. In the School of Architecture, the director of architectural studies and professor of architectural design is Mr. Eugene Bourdon, B.A. This school comprises the Technical College and the School of Art, in the former of which there are classes in the history of architecture, on constructive and historical design, and mathematical and other sciences; while in the latter there are classes in architectural design, and in drawing, modelling, and decorating. Professor Charles Gourlay, B.Sc., A.R.I.B.A., is at the head of the department of architecture and building construction, in which both day and evening courses are conducted; Mr. James S. Boyd being lecturer and assistant. There are also courses in carpentry and joinery, masonry, brickwork, quantity surveying, decoration, modelling in clay and wood carving, and perspective. The Calendar, which is a substantial volume of about 500 pages, is published by Robert Anderson, 142, West Nile Street, Glasgow.

Institution of Municipal Engineers.

At a meeting of the Council of the Institution, held at 39, Victoria Street, Westminster, on September 22nd, 12 applications for membership and seven for studentship were considered. Of the former, nine were accepted, of the latter six. The roll of the Institution now stands at 612 members, and 82 students, making a total of 694. A design for student's certificate was approved, and the secretary was instructed to put the matter in hand. It was decided that three Council meetings during the present financial year should be held on Saturdays at 2 o'clock. Notice of the following motion was given: "That the existing classification of members be reconsidered on a wider basis."

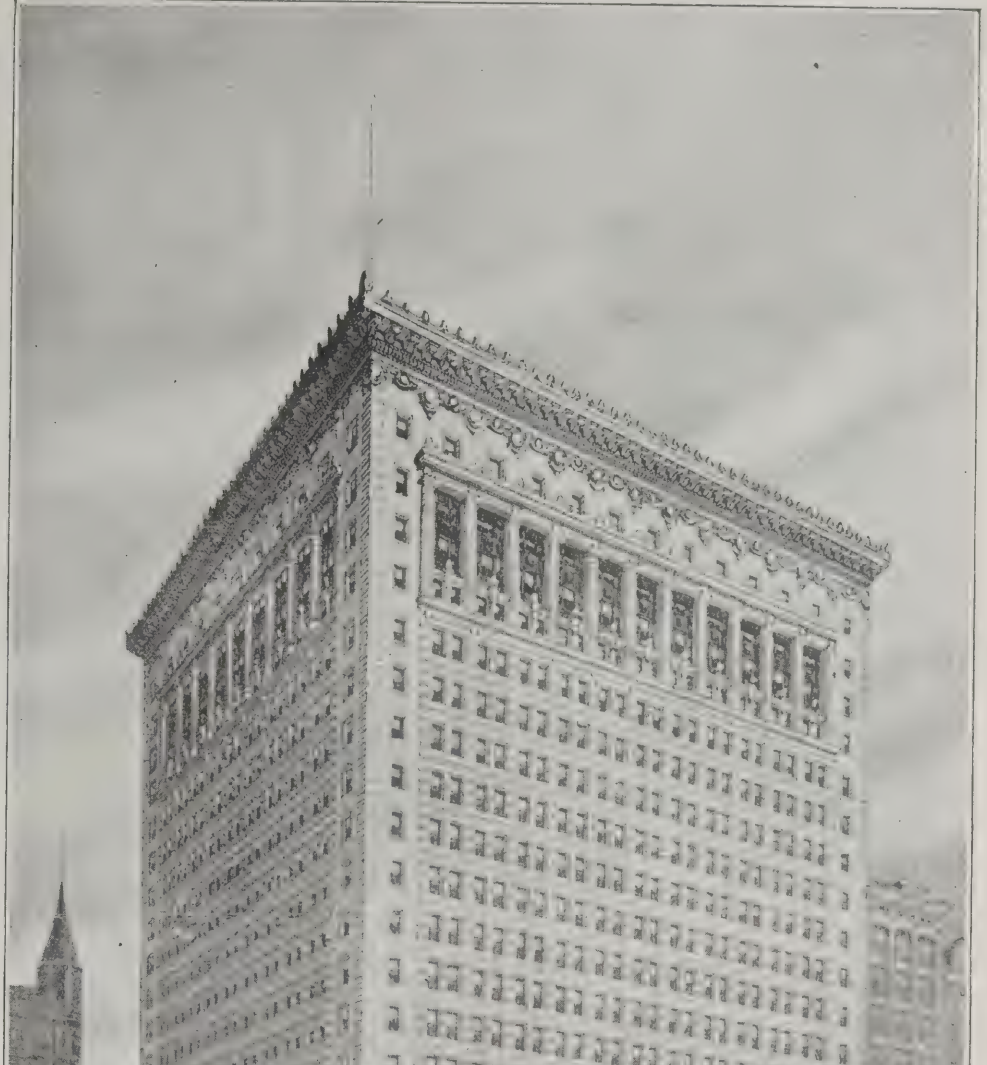

FIG 6 THE PEOPLES' GAS COMPANY BUILDING, CHICAGO. D. H. BURNHAM & CO., ARCHITECTS.

R.I.B.A. Examinations, Autumn, 1909.

The examinations will be held as follows: The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., is to take place on November 8th and 9th. The Intermediate Examination, qualifying for registration of Student R.I.B.A., on November 8th, 9th, 11th, and 12th. Further, the Institute's Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., from November 18th to 26th inclusive. Applications must be sent in on or before Saturday, October 9th. The Testimonies of Study, etc., with the necessary fees, must accompany the applications, and be addressed to the Secretary R.I.B.A., at the Offices of the Institute. Examinations qualifying for the office of District Surveyor in London (pursuant to the provisions of the London Building Act 57 and 58 Vict. c. ccxiii. s. 140), and of Building Surveyor under Local Authorities will be held by the Royal Institute on October 14th and 15th, 1909. All applications must be made on the official forms, to be obtained from the Secretary R.I.B.A.

THE TAX ON "MINERAL" MATERIALS.

GOVERNMENT CONCESSIONS.

In the House of Commons on September 28th and 29th, considerable discussion took place on the question whether clay, chalk, and stone were fit subjects of taxation under the mineral duty clauses of the Finance Bill.

Mr. F. Newdegate proposed to exclude minerals of a less value than 4s. per ton. He sought to exempt from the tax gravel, sand, rough stone, granite used in road making, chalk, refuse banks at collieries, road metal, common clay, and so on. He complained that the Government had been asked for a definition of minerals, and the Committee had never received a straightforward answer. He understood that the tax would fall on sand for brickmaking. A short time ago he sold a bit of land to a building syndicate, and part of the stipulation was that they should have the right to work the sand in connection with that piece of building land. It surely could not be the case that the Chancellor of the Exchequer would expect those people who had bought the land to pay mineral duty, or that he (Mr. Newdegate) as vendor should pay increment duty or other duties in connection with it. There was a quantity of rough stone about the country of no great value, and it was used for building houses. That might come under the definition of minerals, and the owner of the stone might be taxed. Pit heaps were often used for making a common sort of brick, and it would be an absurdity to charge such pit heaps. Road metal cost at the quarry banks about 1s. 6d. per ton, and surely it was not the Government's intention to increase the cost of road metal at a time when they were talking of developing roads throughout the country. In the same way it would not be to the benefit of the community to tax chalk. As to common clay there was a strong feeling throughout the country, and brickmakers felt that they could not stand more taxation. He had had a letter from a brickmakers' association protesting against common clay being subject to the tax on minerals, and the Chancellor of the Exchequer had received a deputation on the subject.

The Chancellor of the Exchequer, interposing, said he had stated the other night that brick clay would be exempt.

Mr. Newdegate said that in any case he was very glad that owing to the representations made to the Chancellor of the Exchequer common sense had been instilled into the brains of those responsible for the Bill. He hoped the other minerals he had spoken of would be taken out of the Bill.

Mr. Balfour protested against the action of the Government in not letting the Committee know what they considered was included in the word "minerals."

Mr. G. H. Lamb wished the exemption to apply to brick clay, brick earth, sand, gravel, and epecially chalk. Chalk was essential to the existence of the cement industry of this country, and it was known that the cement industry was working on a very narrow margin. The Committee ought to bear in mind that this taxation on chalk would be a very small contribution to the Exchequer, and it would mean all the difference between success and failure in many of the cement works of this country.

The Chancellor of the Exchequer said that the Attorney-General had already told the House that the Government had considerable doubt as to the advisability of including clay. The difference between a tax on clay and chalk and a tax on coal was merely a question of administration. It was a question of the revenue which was to be raised—a question whether it was worth all the trouble and inconvenience and cost to the taxpayer in view of the amount of money the Exchequer received. It had been urged upon him from both sides of the House that a tax on clay and chalk would harass certain industries, and would not produce much revenue, and that they ought to be exempted There was a precedent for that, and it was a Conservative precedent, namely, the Irish Land Act. It was a precedent where, after a general statement that all minerals were subject to certain conditions, stones, clay, gravel, and sand were excluded. There was a great deal to be said for that, and when they came to the amendment later on he would be prepared to give favourable consideration to all of them. He would consider them from the point of view that it was not worth while to go to the expense and trouble of collecting the small sums which would be available in those cases. It was a value created by the labour and expense put into it. It was not like coal, which was a valuable mineral.

Mr. Lane Fox suggested lime as being different from coal.

The Chancellor of the Exchequer: I should say that lime and chalk would be pretty much in the same category, but I would like time to consider that point.

Mr. Newdegate mentioned stone.

The Chancellor of the Exchequer said that was a totally different thing. They might have ordinary common stone of no value except the value which labour put upon it, but they might also have very valuable granite. He would have to consider the point. Valuable granite was really a mineral in the essential sense of the word, but when they came to the cheaper substances he thought a good case had been made for the exemption of sand, chalk, and common brick clay. It was possible to draw some distinction in the case of clay, certain qualities of which were valuable minerals, such as china clay and fire clay. If it was possible to draw a distinction between common stone for roads and the more valuable stone, he was prepared to consider it.

Mr. Bonar Law pointed out that the Chancellor of the Exchequer had argued that the tax on royalties could not reach the industry, but would be paid by the royalty owner, yet here he was making exemptions because the tax would reach the building trade.

Mr. R. Whitehead was grateful for the concession of the Government.

Earl Winterton remarked that if the exemption had not been made scarcely a farmer would have escaped the taxation, because on nearly every farm there were chalk, flint, gravel, and clay which was taken and worked. It was stretching a point to say that they were grateful to the Chancellor of the Exchequer. He did not know why the concession was not made months ago, as the proposals of the Budget had had a serious effect on the building industry and the brickmaking industry.

Mr. Scott Dickson urged that Scotch granite should be exempted from the tax.

Mr. Markham declared that in some cases the royalty on clay amounted to 8d. and 9d. per ton, and he did not see why the owners of such royalties should escape. In the town of Mansfield and adjoining towns there were sand quarries where the sand sold for a great deal more than the coal, and in some cases the owners got enormous royalties. He regretted that the Government had given way.

Mr. L. Hardy suggested the exemption of marl.

At a later stage the Attorney-General moved an amendment exempting from the mineral rights duty common brick clay, common brick earth or sand, chalk, limestone, or gravel.

Mr. Pretyman moved to include in the exemption granite, building stone, or road stone. He thought that if limestone were exempted so also should be building stone.

The Chancellor of the Exchequer said they must draw a rough line somewhere. Granite was a very valuable mineral, and the tax upon it did not interfere with industry. The people who received the royalty had nothing to do with the industry except to share the profits. In the case of chalk it was the people who put their money into the development who owned the royalties as a rule. He did not think it possible to draw a distinction between road stone and granite and those other stones. The Government had gone very far to meet the case of road stone, and it was not possible to go any further, though he would consider the matter.

Mr. Pretyman then withdrew his amendment, and the exemption from the tax of common brick clay, common brick earth or sand, chalk, limestone, or gravel was agreed to.

Works in Progress and Completed.

ABERGAVENNY.—Extensions are to be carried out at Holy Trinity Church, Abergavenny, and plans have been prepared by Mr. E. A. Johnson, architect. These provide for the erection of a north aisle to correspond with the south aisle, and a vestry. The estimated cost of the work is £1,250. Messrs. J. G. Thomas and Sons, builders, of Abergavenny, commenced the extensions in July, and it is expected that the work will be completed by the end of the year.

ABERYSTWYTH.—The new premises of the London and Midland Bank have just been completed. The building is Georgian in style, and is the design of Messrs. Woodfall and Eccles, Castle Street, Liverpool. The builder was Mr. Peter Edwards, of Dodleston, Chester.

ANDSELL.—The institute and public hall which have been erected here are the design of Mr. G. H. Willoughby, F.R.I.B.A., of Manchester and St. Annes, the estimated cost being £5,000. The planning of the building provided for two complete sections, a public hall and an institute. The former is 75ft. by 34ft., with seating accommodation for 400 people, artistes' retiring-rooms, catering-rooms, and cloakrooms. In the institute portion three large class-rooms, divided by folding partitions, have been obtained on the lower level, and on the main floor provision has been made for a large reading-room, a library and billiard-room. The architecture is a simple rendering of Elizabethan.

BRAY, IRELAND.—At a public meeting of the Bray Library Committee it was stated that Mr. Carnegie's private secretary, writing from Skibo Castle, Sutherland, required assurance from the Committee that the library would cost, ready for occupancy, and for the purpose intended, not more than the £2,000 promised. As the Committee had accepted a tender for £1,867, and had cut matters so fine, where did they propose finding the money to meet the inevitable deficit? Mr. MacDonnell, Town Clerk, stated that he had replied that if the £2,000 which Mr. Carnegie so kindly promised should be exceeded, the excess would have to be met out of the amount of the penny rate, which had been accumulating for the past three years, namely, now £368, and with the current year's amount making £498. There has been promises of subscriptions for books from various councillors and prominent local people, and one ex-councillor, Mr. Edward Lee, promised to give £100 towards this object. The council had no hesitation in thinking that a considerable sum will be subscribed for this purpose.

BETHNAL GREEN.—The foundation stone of the new municipal buildings has just been laid. The cost of the building, including £8,560 for site and furnishing, will be £35,510. There is a frontage to Cambridge Road of 77ft., and to Patriot Square of 131ft. The Council chamber is a rectangular apartment on the first floor, with a floor space of 2,000ft. super. There is a public gallery overlooking the council chamber, and this has its own staircase to the ground floor. The architects are Mr. P Robinson, F.R.I.B.A., and Mr. W. Alban Jones, and the builders Messrs. Brand, Petit, and Co.

DUDLEY.—The foundation-stone of a new high school for girls, to cost nearly £24,000, has been laid.

DUNDEE.—The new Technical College, which is now nearing completion, will cost approximately £70,000, of which sum Sir William Ogilvy Dalgleish, Bart., has contributed £11,000.

ELY.—Lightning conductors were first fitted to Ely Cathedral about the year 1859, to the specification of Sir William Snow Harris, F.R.S., Advisor on Lightning Conductors to the Crown, but doubts were entertained as to whether these were still in an efficient condition. Mr. Alfred Hands, F.R.Met.S., was therefore instructed by the Dean and Chapter to make tests and report as to the advisability of adopting more modern methods. It has been found necessary to instal an entirely new system of copper tapes. This comprises two conductors on the western tower, with branches from the flagstaff and four turrets, two from the towers over St. Catherine's Chapel, and

(*Continued on page 270.*)

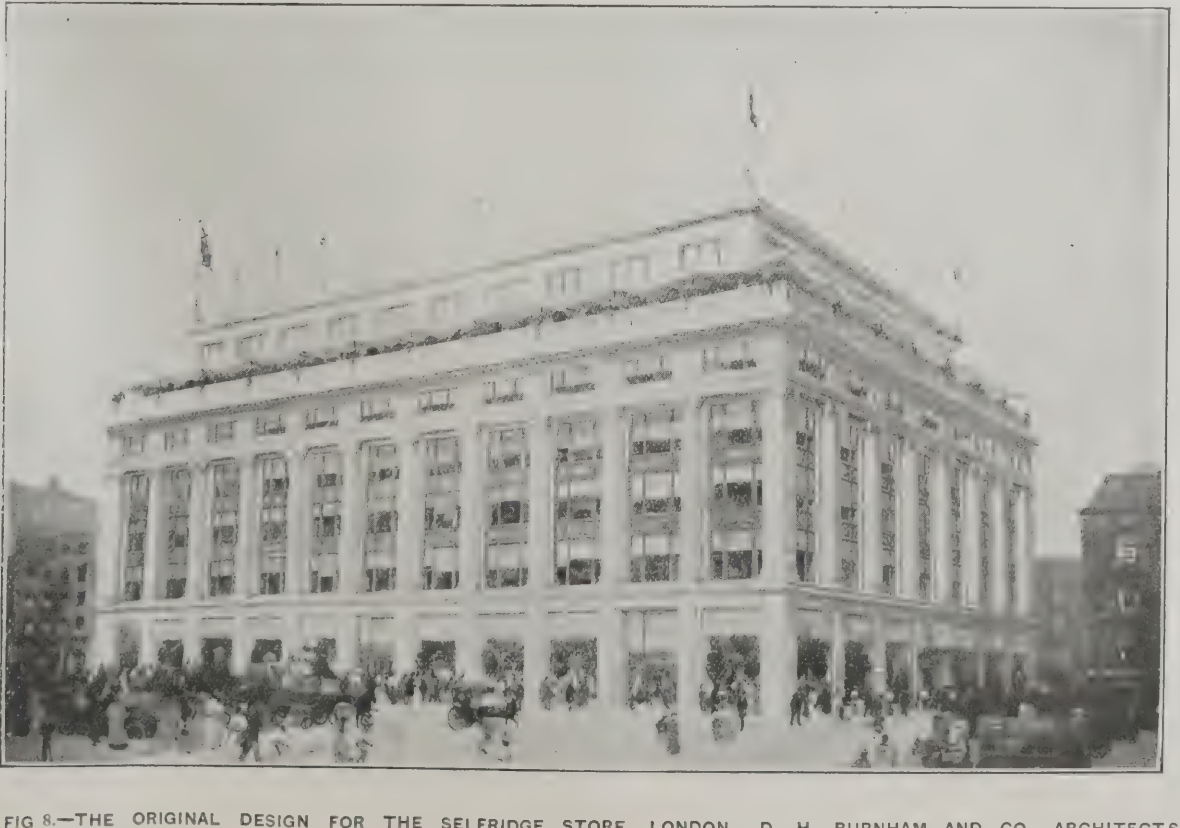

FIG 8.—THE ORIGINAL DESIGN FOR THE SELFRIDGE STORE, LONDON D. H. BURNHAM AND CO., ARCHITECTS

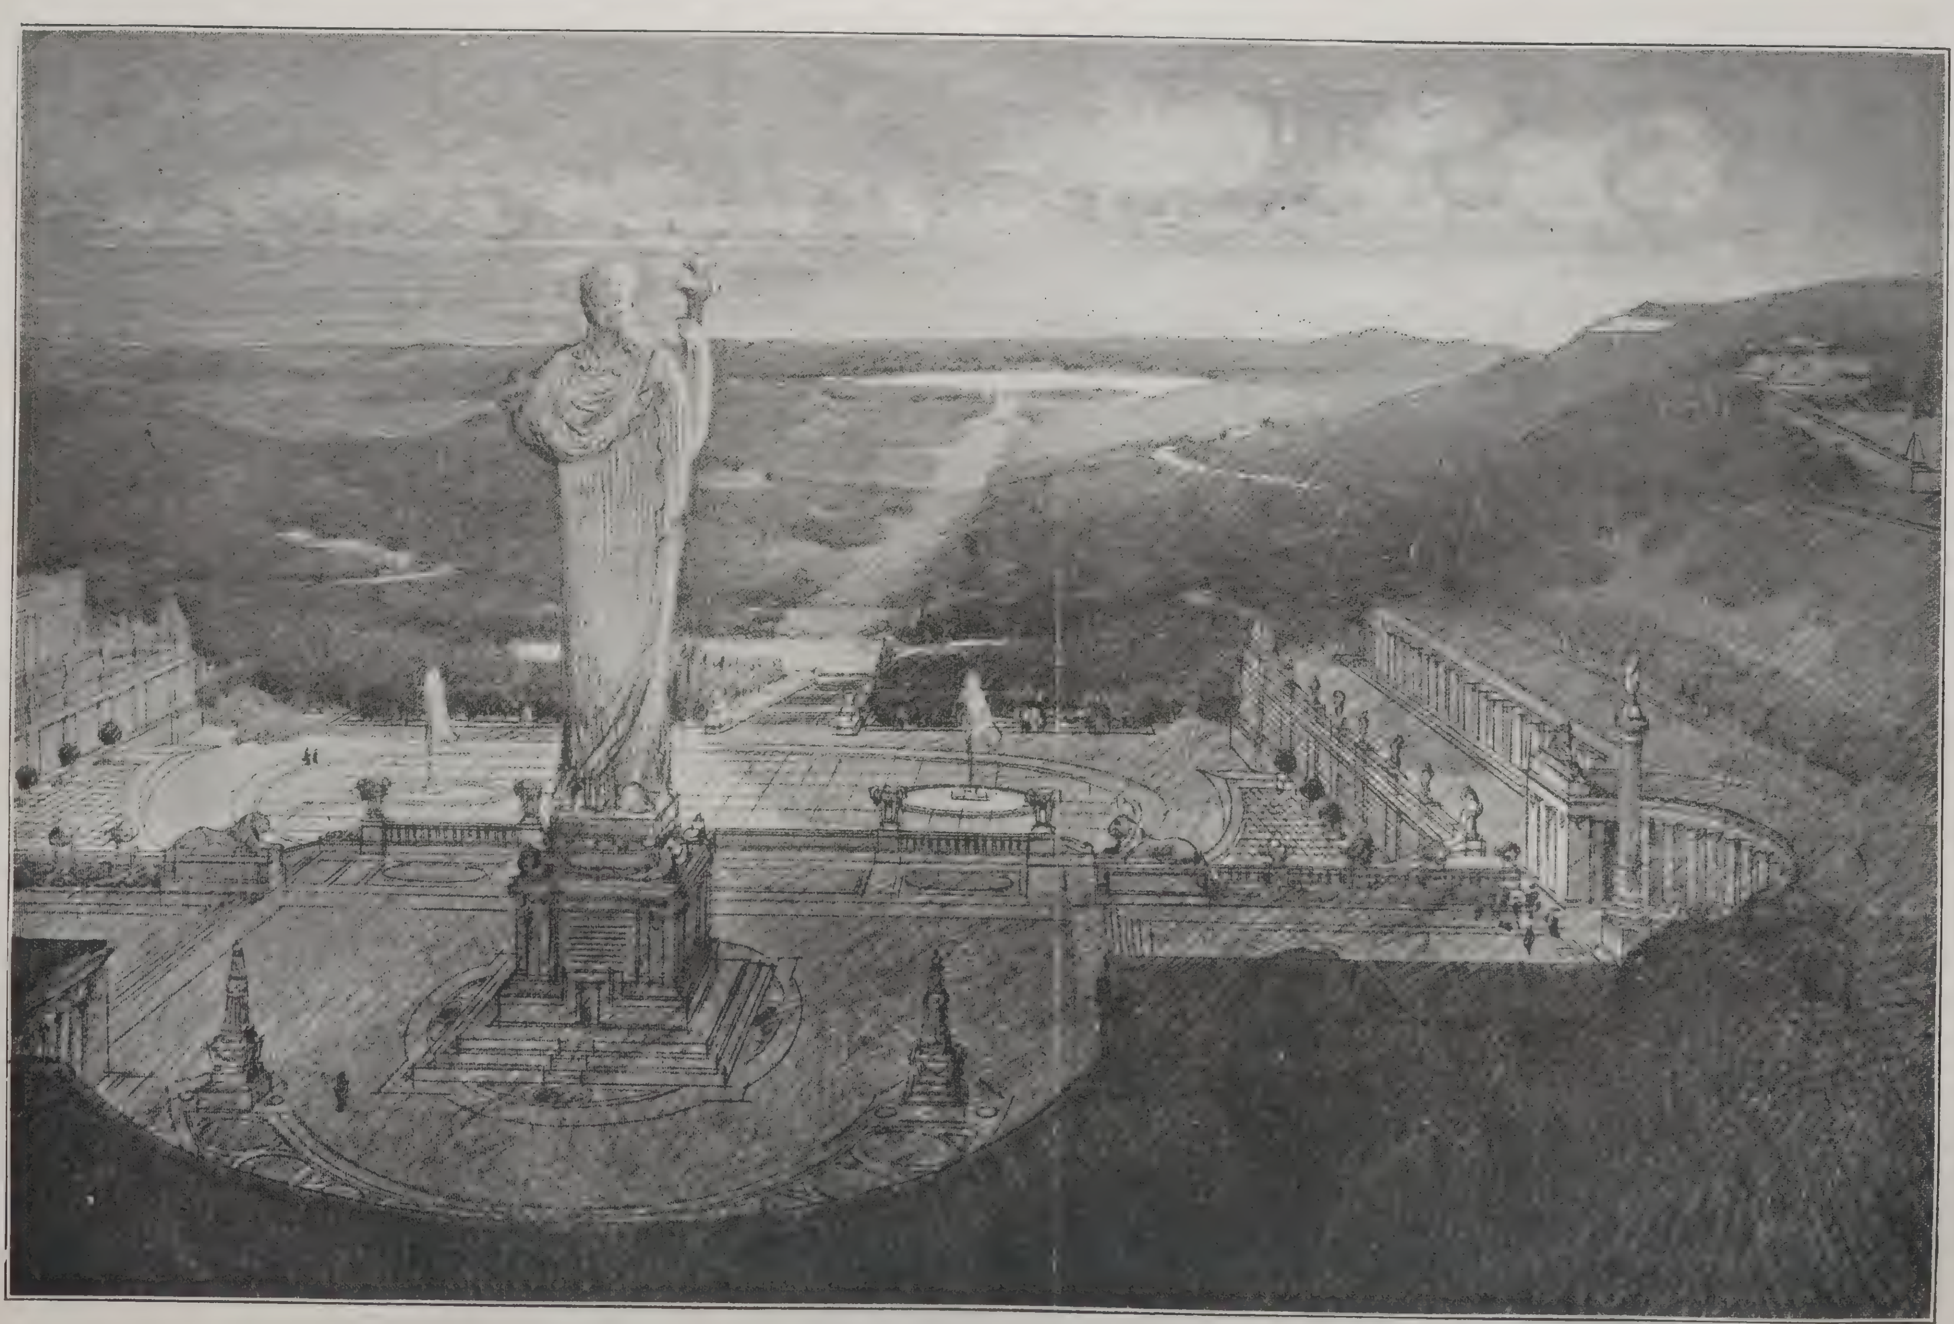

FIG. 9.—THE ATHENÆUM, SAN FRANCISCO. PART OF MR. D. H. BURNHAM'S PLAN FOR REBUILDING THE CITY.

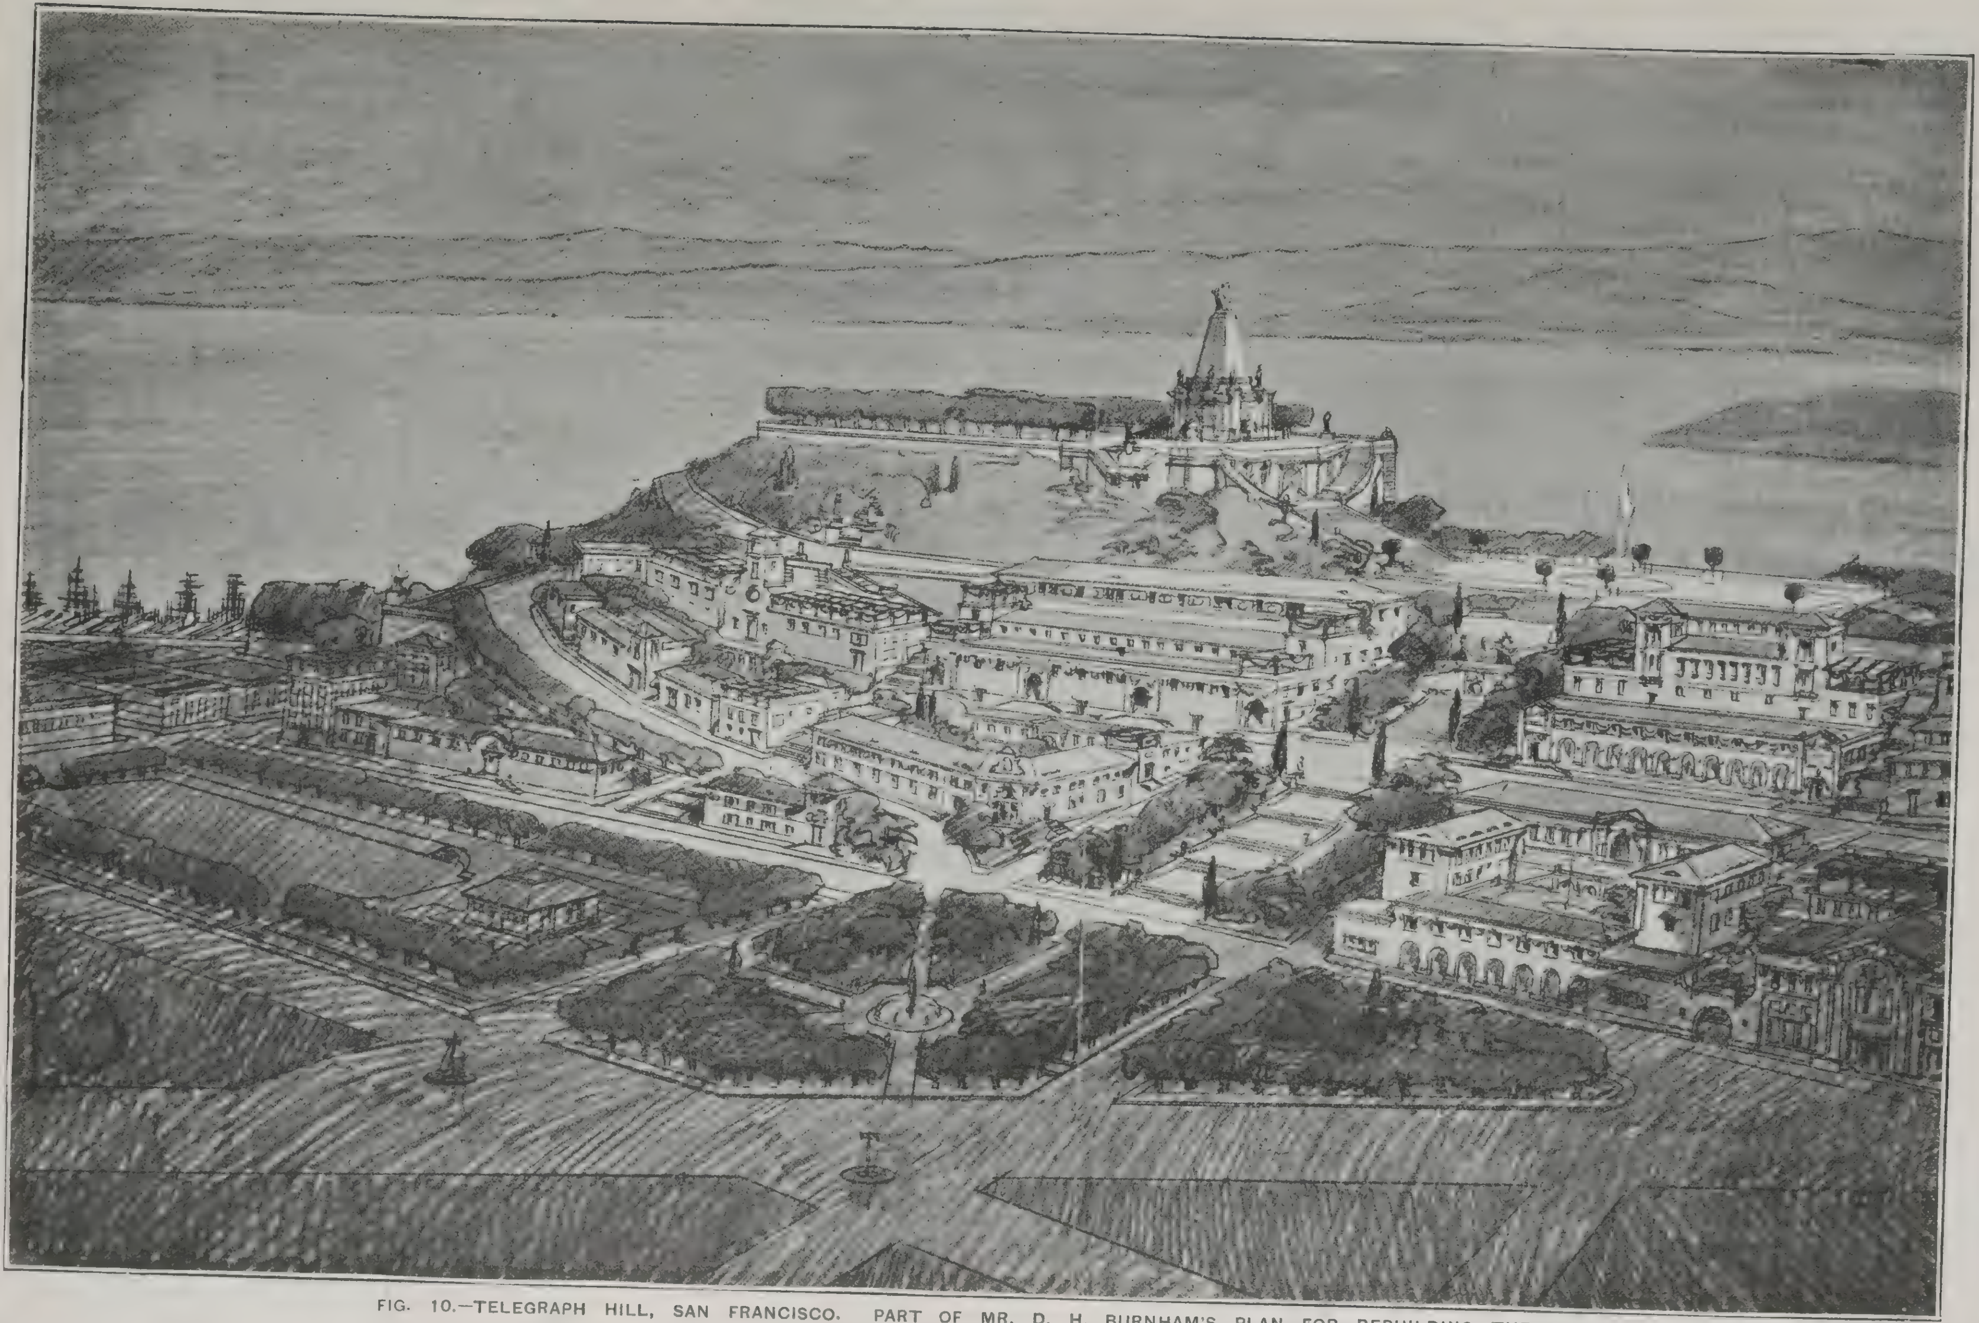

FIG. 10.—TELEGRAPH HILL, SAN FRANCISCO. PART OF MR. D. H. BURNHAM'S PLAN FOR REBUILDING THE CITY.

four from the eastern or lantern tower, as well as from the nave, choir, transepts, and Lady Chapel. The system has been arranged so as to be scarcely noticeable, and does not detract from the appearance of the cathedral, and the work has been carried out by Messrs. J. W. Gray and Son, of 91, Leadenhall Street, London, E.C., under Mr. Hand's direction.

GLASGOW.—The large extensions of the Glasgow Cancer Hospital, which will cost when completed £21,000 (exclusive of furnishings), have been erected on the most approved hospital designs, comprising all the departments required for the treatment of cancer. The reconstruction and equipment of the buildings have been carried out, under the supervision of Dr. Mackintosh, of the Western Infirmary, by Messrs. James M. Monro and Son, architects.

HAMILTON.—A new Baptist Church has been recently opened here. The building occupies a site at the corner of Kemp Street and New Street, near the Caledonian Railway Station. The style of architecture is late fifteenth century Gothic, and the total ocst of the buildings is £5,200. Messrs. Miller and Block, Glasgow, are the builders.

HANDSWORTH.—The girls' new grammar school, which is now being erected, will cost, irrespective of the furnishing, £36,000. Accommodation will be provided for 450 girls. Outwardly, the building, which will be over 300ft. long will be Renaissance in character. The architects are Messrs. J. A. Chatwin and Son. The contractors for the building are Messrs. Collins and Godfrey, of Tewkesbury, and the estimate of Messrs. Ashwell and Nesbit for the heating and ventilating apparatus has been accepted.

HARROGATE.—A new lecture hall and ladies' parlour are now being built at a cost of £2,200. Another pair of Primitive Methodist Children's Homes are also being erected. The scheme is to build in all twelve pairs of homes, each home being designed to accommodate twelve children.

HEADINGLEY, LEEDS. — The new schools, which were opened recently, will accommodate between 600 and 700 scholars, are erected in stone to harmonise with the adjoining chapel, and have open-timbered roofs. They comprise a large main hall, lecture hall, ladies' parlour, infants' rooms, six class-rooms, and a number of vestries. The total cost of the scheme, including the site, is about £4,250. The plans were prepared by Mr. G. F. Danby, of Leeds, and the entire building contract has been executed by Messrs. W. Wilson and Sons, Headingley.

LANCASTER.—The various schemes of improvement that Lord Ashton has lavishly distributed throughout his native town, are now nearing completion. The new Town Hall, the latest example of that nobleman's bounty, was designed by the late Mr. E. W. Mountford, F.R.I.B.A., who was the architect of Sheffield Town Hall, the new Old Bailey, and the new Museum and Technical School of Liverpool. The design of the new Town Hall is classic, founded on the work of Sir Christopher Wren and his pupils. To Dalton Square there is a frontage of 132ft., and to Thurnham Street of 220ft., the main entrance being in Dalton Square from a pillared portico approached by a flight of steps. In the centre of the building is the new police court, and the south end is occupied by a public hall, 101ft. by 61ft., accommodating 2,000 persons and containing a fine organ. In the tower, which stands 146ft. high, has been placed a clock and bells.

LONDON.—The Piccadilly Arcade is now in course of erection, and is hoped to be completed by March, 1910. It consists of 26 shops, the upper parts to be occupied by chambers and offices. The arcade will form a new link between Piccadilly and Jermyn Street. The architect's drawings were exhibited at the Royal Academy.

The new workhouse and infirmary at Homerton, which have been built for the Guardians of the City of London Union, have been designed for the accommodation of 661 inmates and 63 officers, and have cost between £50,000 and £55,000, the average cost per head being £154. The architect is Mr. Albert E. Pridmore, and the builder, Mr. Albert Monk, of Lower Edmonton. The whole of the work was carried out under the supervision of Mr. E. R. Dolby, M.Inst.C.E., as consulting engineer.

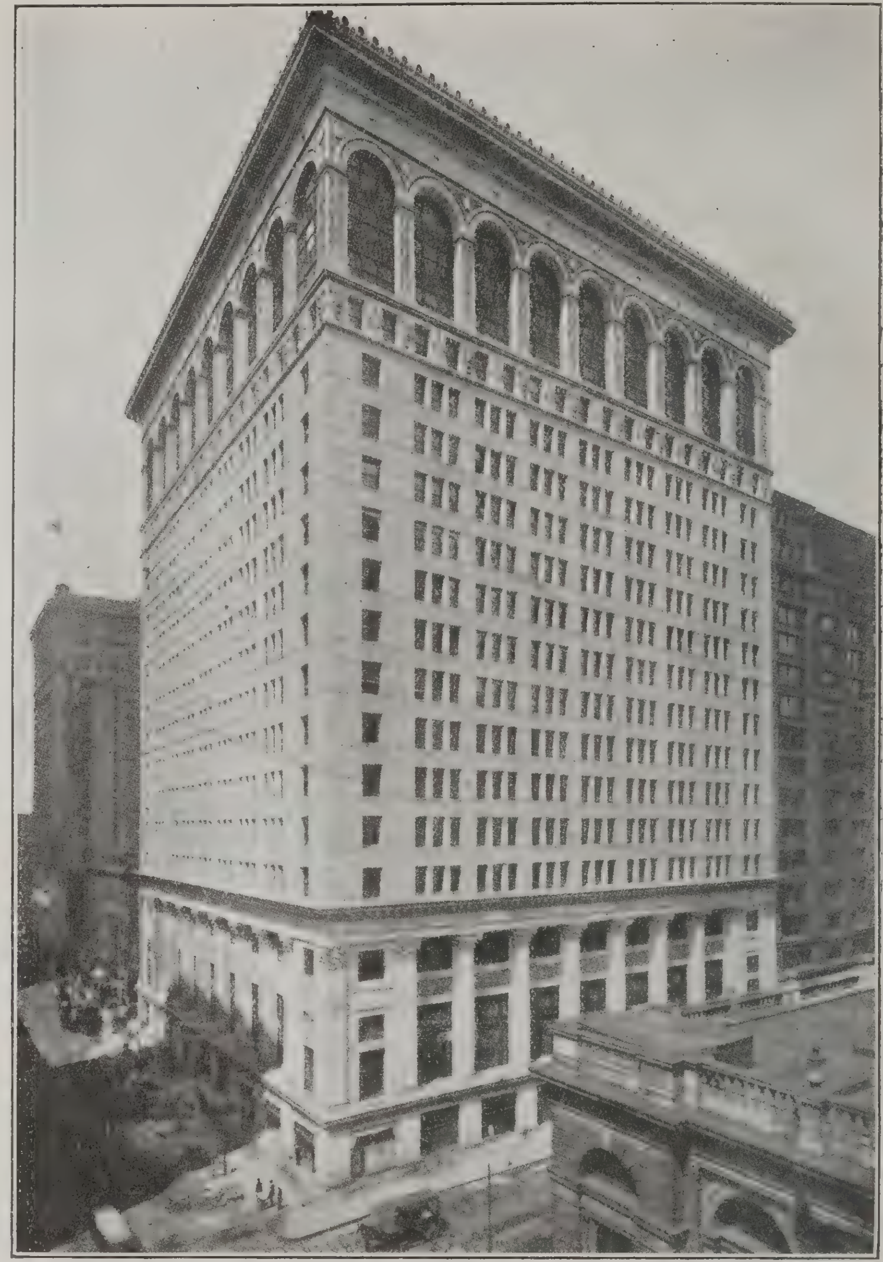

FIG. II.—THE COMMERCIAL BANK BUILDING, CHICAGO. D. H. BURNHAM AND CO., ARCHITECTS.

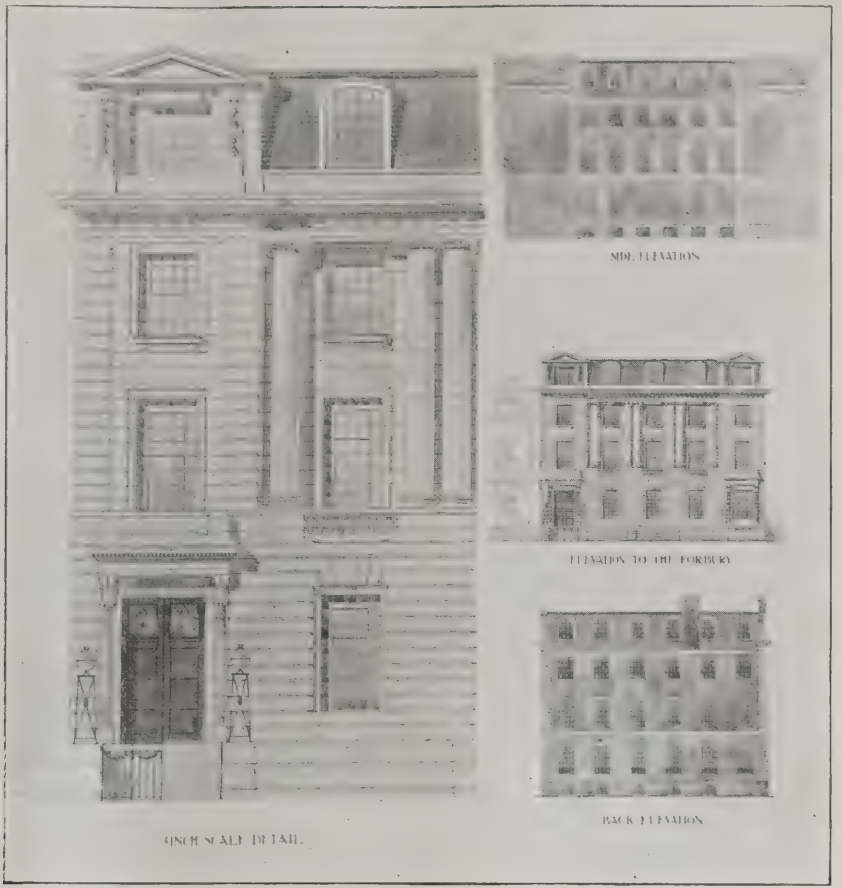
LONDON.—The National Hospital for the Paralysed and Epileptic, Queen's Square, Bloomsbury, will on November 2nd celebrate its jubilee, and it is intended to commemorate that event by raising a fund of £50,000 (of £1,000 for every year of its existence), which will provide a much needed extension of the out-patient department and adequate accommodation for the nursing staff, besides furnishing the nucleus of a fund which will in some degree secure the future of this great institution. The King is the patron of the hospital, which is the oldest and largest of its kind in the world. It contains 200 beds, 40 of which are at the convalescent home, and 90 incurable persons receive pensions of from £10 to £20. The main part of the building is a memorial to the Duke of Albany, and the Duchess of Albany is president of the Jubilee Committee, which has pledged itself to raise the sum necessary to carry out the improvements and alterations approved by King Edward's Hospital Fund. The sum of £17,000 has been already paid or promised, and 800 collectors are devoting themselves to this work. The King has consented to open the new buildings provided by the fund on November 4th.

MANSFIELD.—The most important of the three schemes of Church extension in Mansfield, the erection of St. Lawrence's, has now been completed. At present the church consists of a nave, chancel, sacristy, organ chamber, and vestry, giving accommodation for 320 persons, but it is hoped in the near future to add north and south aisles, when the church will hold 500 persons. The church has been built by Messrs. T. and R. Moore, from the designs of Mr. L. A. Westwick, the contract price being £3,025.

NORTHAMPTON.—The new St. Andrew's Hospital which is now in process of erection, will be two storeys in height, with a frontage of 140ft. Mr. Herbert Norman and Mr. Arthur McKewan, A.R.I.B.A., of Northampton and Birmingham, are the architects. Their plans were accepted, in open competition, for the scheme which embraced the re-building of the present school on Abington Square and the erection of a master's house and hostel on the Billing Road site. The cost of the building (which is in the hands of Mr. A. P. Hawtin) will be approximately £10,500, and the building of a boundary wall, and many other items of necessity will bring the cost to about £19,500.



BERKSHIRE COUNTY OFFICES COMPETITION. THIRD PREMIATED DESIGN. WILLS AND ANDERSON, ARCHITECTS.

The first premiated design was shown in our issue for September 22; the second, in the issue for September 29.

Proposed New Works.

HAPTON.—The plans of a new county school were recently subjected to the examination of the Parish Council. There will be seven classrooms in the proposed school, five rooms accommodating 40 scholars each, and two rooms accommodating fifty scholars each. The estimated cost of the buildings is £3,996 furnishing £300, and site £554.

PONTEFRACT.—After protracted discussions and repeated back-references of their recommendations as to the site of the proposed new Council School for Pontefract, the Education Committee have referred the whole question to the Corporation. The Corporation and the Education Committee have decided to recommend the purchase of an acre of land in Mayor's Walk from Mr. Robert Marshall, at 1s. 9d. per square yard. The alternative site was a piece of the old cricket field, at the west end, at 2s. 6d. per yard.

SCARBOROUGH.—The Entertainments Committee have adopted a scheme for the erection of a large pavilion in the Alexandra Gardens on the North Cliff at a cost of £2,500. The approval of the Town Council, however, is required.

The Petersfield Rural District Council have adopted a scheme of sewerage and sewage disposal for the parish of Liss, Hampshire, prepared by Mr. Harry W. Taylor, A.M.I.C.E. (Messrs. Taylor, Walling, and Taylor, of Newcastle-upon-Tyne, and Birmingham. The sewage will be collected by a series of sewers in the village, and conveyed down the valley to the outfall works near Andlers Ash. Here it will be pumped by oil engines and centrifugal pumps into a receiving tank, and from this it will pass through hydrolitic and detritus tanks, a percolating filter, and finally over two acres of land, the effluent ultimately discharging into the River Rother. The estimated cost of the works is £4,000.

Enquiries Answered.

Corr*espondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.*

The *Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.*

Enquirers *whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.*

Answers *by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.*

This *fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.*

The *Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns*

Prohibition from Practice Under Articles of Apprenticeship.

SUSSEX.—X. Y. Z. writes: "Ten years ago I was articled to an architect, and the following clause was in my indentures, viz.: I should not at any time carry on the profession or business of an architect or surveyor anywhere within a radius of ten miles. Am I absolutely bound by this clause indefinitely, or do you think it would not hold good now after ten years have expired? Of course, you understand I don't wish to take any of the work in an underhanded way. I have approached him on the matter, and he refuses consent."

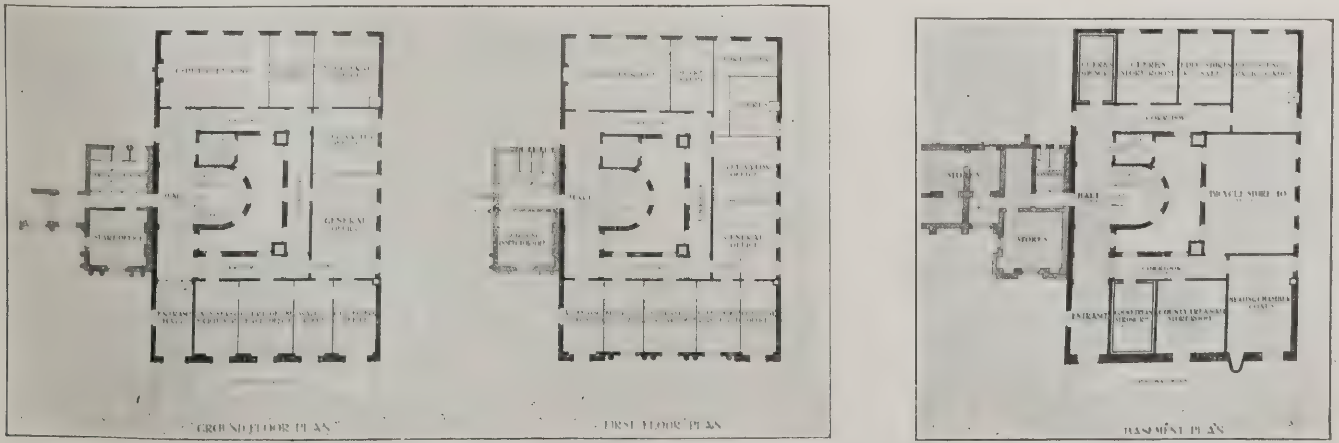
—Certainly you are bound by the terms of the original articles so long as your late principal practises in the district; and it is even possible that they may hold good to a successor should he sell his business. His legal remedy if you break your covenant is to obtain an injunction to prevent you, and it is probable also that damages would lie against you—though this latter would become a matter of proof that damages had actually been sustained.

F.S.I.

R.I.B.A. Mechanics and Physics.

"Would you kindly let me know of a book on mechanics and physics which would be sufficient for the requirements of the Preliminary R.I.B.A. examination?"

—There are a great number of text-books on the subjects of mechanics and physics, suitable for the Preliminary R.I.B.A. examination. The two we can most confidently recommend from experience are "Elementary Physics," by M R. Wright; "Theoretical Mechanics," by J. E. Taylor. Both belong to Messrs. Longmans, Green and Co.'s Elementary Science Manuals. B. and B.



BERKSHIRE COUNTY OFFICES COMPETITION. THIRD PREMIATED DESIGN. WILLS AND ANDERSON, ARCHITECTS.

Book on Hot-water Work.

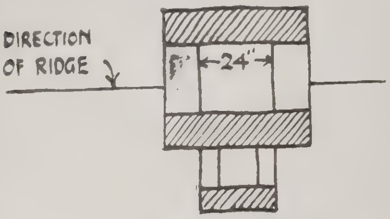
SHEFFIELD.—J. M. AND SON write: "Can you recommend a book dealing with domestic hot-water supply, flow-and-return, etc., both for the cylinder system and also the tank system, for use by our apprentices?"

—An excellent book on "Domestic Hot Water Work," by Fredk. Dye, which should exactly suit the requirements stated, is published, price 2s., by Messrs. Cassell and Company, Ltd., Ludgate Hill, London, E.C.

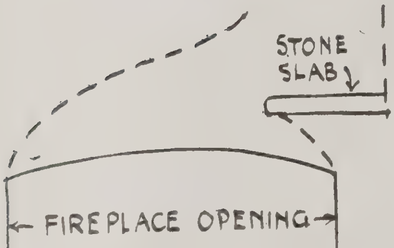
Flue Construction.

WELLINGTON.—E. T. H. writes: "I am building a small farmhouse which has a wide open fireplace. My experience is that it is very difficult to construct these so not to smoke. In the present case my flue is not less than 2ft. square, and I think it advisable not to curtail same at the top. My idea is to cover flues on top, and have outlets for smoke at sides. Can you suggest a better way?"

—The covering above the top of the flues will, by keeping the chimney dry internally, greatly improve the chances of the flues drawing properly, and will also lessen the likelihood of down-draught. The side openings would perhaps be more effective if they occurred in each case on opposite sides of the chimney, or as that appears impossible in this case, the opening not so placed might be altogether closed and the remaining two enlarged as sketch A above. The flue is very large, and despite these precautions may not be found satisfactory. If circumstances permit, the throat of the flue may be constructed as sketch B, which has been found effective in baffling down-draught in some obstinate cases. G.



SKETCH "A"



SKETCH "B"

Law as to Advertising for Tenders.

SOUTHAMPTON. — MANUFACTURER writes: "Will you kindly advise me what is the law relative to the advertising for tenders by borough engineers? Assuming it to be a fact that they are obliged to advertise publicly all work over a certain amount, will you give your opinion whether by including in a contract which was advertised, prime cost sums of substantial amount for which tenders have not been advertised, such law has not been complied with."

—In the absence of more precise particulars, we should suppose that the advertisement of the general contract included all the items, and that the authority is not bound to dissect the contract in the manner suggested.

Mr. Alec. W. Percival, P.A.S.I., architect and surveyor, has removed from 12, George Street, Plymouth, to Sun Buildings, Bedford Street, Plymouth. Telephone, 222 Plymouth.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Oct. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea, which will be returned on receipt of a set of plans in accordance with the conditions. The deposit will also be returned to architects not desiring to compete if all papers sent are returned within seven days. Last day for receiving plans, Saturday, Oct. 30, 1909. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30. and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas respectively will be awarded for such two designs as shall be judged of sufficient merit by the Council, and placed by them as first and second; the premium of twenty-five guineas to be afterwards merged into the usual commission payable to the architect, provided the work is carried out by such competitor. Plan of the site and copy of the conditions may be obtained on application to the undersigned on and after the 24th instant on payment of one guinea, which will be returned on receipt of a bona-fide design. Drawings to be deposited at the Clerk's Office, Town Hall, Herne Bay, not later than noon on the 30th November next.—Joseph Jubb, Clerk to the Council, Town Hall, Herne Bay.
Dec. 18	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly. Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist and advise the committee in deciding the competition. The competition will be for the educational block and for the general laying out of the estate including the position of the various hostels, swimming bath, laundry, sanatorium, principal's house, vice-principal's house, lodges, gardens, playing-fields, roads, etc. On the payment of a deposit of £2 2s. (which will be returned on receipt of a bona-fide design) each competing architect may obtain a copy of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings. Designs to be delivered to the undersigned not later than 12 o'clock noon, on Saturday, 18th December, 1909. James Graham, Secretary for Education, Education Department, Leeds.
Jan. 31, 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., which will be returned on receipt of a design in accordance with the conditions, or if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle. Director of the Museums. City Hall, Cardiff.

Our Plate.

Newburn District Council Offices.

We give plans, sections, and elevation of this building, the architect being Mr. Edward Cratney, of Wallsend-on-Tyne, whose design was placed first in the recent competition. Some notes on the design appeared in our last issue.

SECONDARY SCHOOL FOR BOYS, MAIDENHEAD.

The materials of which this school is built are, generally, red brick, with tile courses, copings, etc. The woodwork is painted ivory white. The hall was to be used for art classes and meals, for which reason the class-rooms are approached by corridors, sufficient space being left in the hall for gangways, and a north light provided. The upper floor provides a science laboratory, and further class-room accommodation; mistresses' room, etc. The school provides 150 places, and cubes up, at the restricted amount of £5,000, at 6d. The general shape of the buildings was determined by the site and surroundings with a view of getting an equal exposure to all class-rooms, etc. Basement to provide dinners. Mr. A. O. Cave is the architect.

Coming Events.

Friday, October 8.

ARCHITECTURAL ASSOCIATION, 18, Tufton Street, Westminster.—Annual General Meeting; President's Address (by Mr. Henry Tanner, F.R.I.B.A.,) and Distribution of Prizes. 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION, 6, Higham Place, Newcastle-on-Tyne.—Visit to Scotswood Council Schools and Denton Hall. Members will assemble at Newcastle Station at 2.15 p.m.

Thursday, October 14.

SOCIETY OF ARCHITECTS, Staple Inn Buildings (South), Holborn, W.C.—Twenty-fifth Annual General Meeting, 8 p.m.

Federation News.

LONDON MASTER BUILDERS' ASSOCIATION.

Secretary: T. Costigan.

The usual monthly meeting of the Council of London Master Builders' Association was held on Thursday, September 16th, the president, Mr. F. G. Rice, in the chair.

The President reported to the Council upon the visit of Belgian master builders to London, and the steps taken to make the visit pleasant and useful. Much gratification was expressed at the results, and the Council passed a vote of thanks to the president and sub-committee for their successful arrangements of the receptional dinner given to the visitors, numbering about 100, at the St. Ermin's Hotel, Westminster, when a good many members of the London Master Builders' Association and ladies were present. The following telegram received from the President of the Antwerp Association of Master Builders was read: "Dover Pier, 15th August, 1909.—To Mr. Rice, president London Master Builders' Association.—Before leaving England, the Belgian Master Builders wish to send to your Association their brotherly salute, with the expression of their feeling of gratitude for your kind reception, which they will remember for ever.—HESBAIN."

The chairman of the organisation committee (Mr. F. Higgs) reported to the Council the recommendations of this committee which, after considerable discussion, were agreed to, and instructions issued to give due effect to their adoption.

In response to an invitation from the president of the Quantity Surveyors' Association, the president (Mr. F. G. Rice), Mr. Frank May, Mr. Benjamin I. Greenwood, and Mr. G. Bird Godson, were selected to represent the L.M.B.A. at a conference re tendering without quantities being supplied, on Wednesday, October 13th.

THE NEWBURN COUNCIL OFFICES
COMPETITION.

SELECTED DESIGN :
EDWARD CRATNEY, ARCHITECT.

Legal matters of considerable importance to the trade were discussed, and referred to the solicitor for consideration and report.

The secretary reported that the new agreement betwen the National Federation of Building Trade Employers and the National Association of Operative Plasterers was signed by the respective delegates, with the following provision required by the Council of the L.M.B.A. duly inserted: "That it be an instruction in signing the amended general rules that it be done with the understanding with the operatives that the present rules between the L.M.B.A. and the N.A.O.P. be thereby not superseded."

The president called attention to the opening of the extension of the L.C.C. School of Building at Brixton, intimating that he hoped to be present and to be supported by the members of the Council, to whom the principal of the school had extended a cordial invitation. Mr. F. L. Dove, L.C.C., past president, promised to give an address to the students.

A letter was read from the Carpenters' Company with reference to their exhibition of woodwork in 1910, and instructions given.

The article in the "Builders' Journal" on "Builders' Locked-up Capital" was referred to, but, owing to the lateness of the hour, this and several other matters were deferred to the next Council meeting.

BOLTON AND FARNWORTH ASSOCIATION.

Secretary: J. R. Vose, F.C.I.S.

Various matters of importance have been before the Bolton and Farnworth Association at their recent meetings. One of the members had had a dispute as to the balance of account for a considerable sum with a local public authority, and was unable to get complete satisfaction, owing, it was alleged, to the form of contract which he had signed, which made the surveyor the sole arbitrator. The conditions of the work and orders given made the position one of a very contentious character, and led to much dissatisfaction on the measuring up of the job. The association appointed a special sub-committee to go into the matter, and have, after considerable trouble, and interviews with counsel, succeeded in bringing the matter to a fairly satisfactory issue.

The association is further considering the question of technical education in its relation to the building trade, and representations will be made to the local education authority on completion of the report.

It has further been decided to complete a day work price list for all trades, to be contained in book form. The increase of membership continues to be satisfactory.

Up to date 17 new members have joined this year.

Several matters of importance to the trade, including the maintaining of works for a period of three years after completion, are to be considered.

It is intended to invite the contractors at Horwich to a meeting to be held there, with a view to their joining the local association, as they are at present unattached.

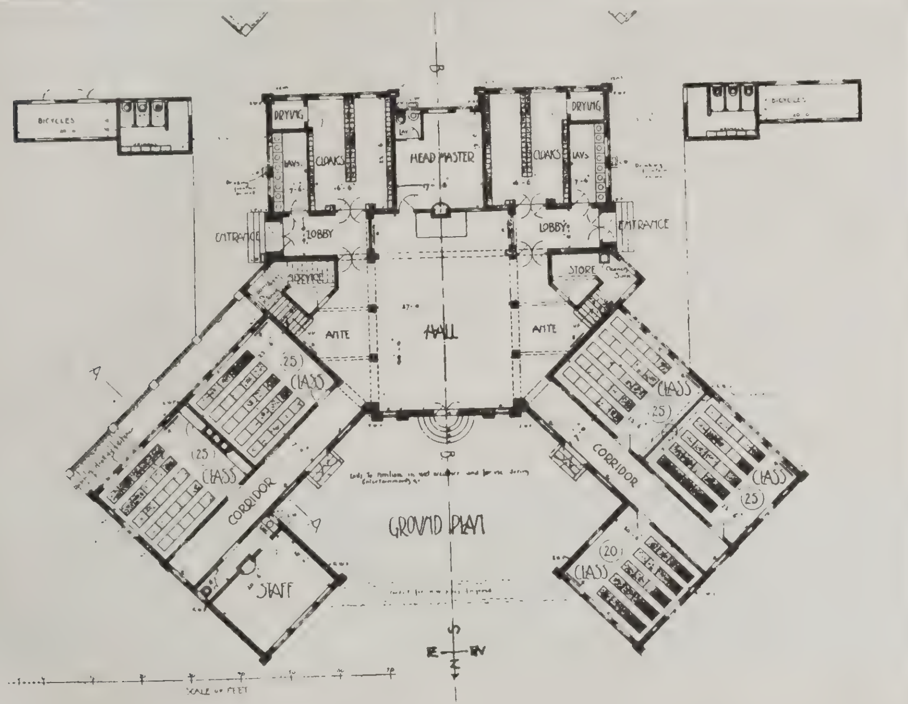
BIRMINGHAM ASSOCIATION.

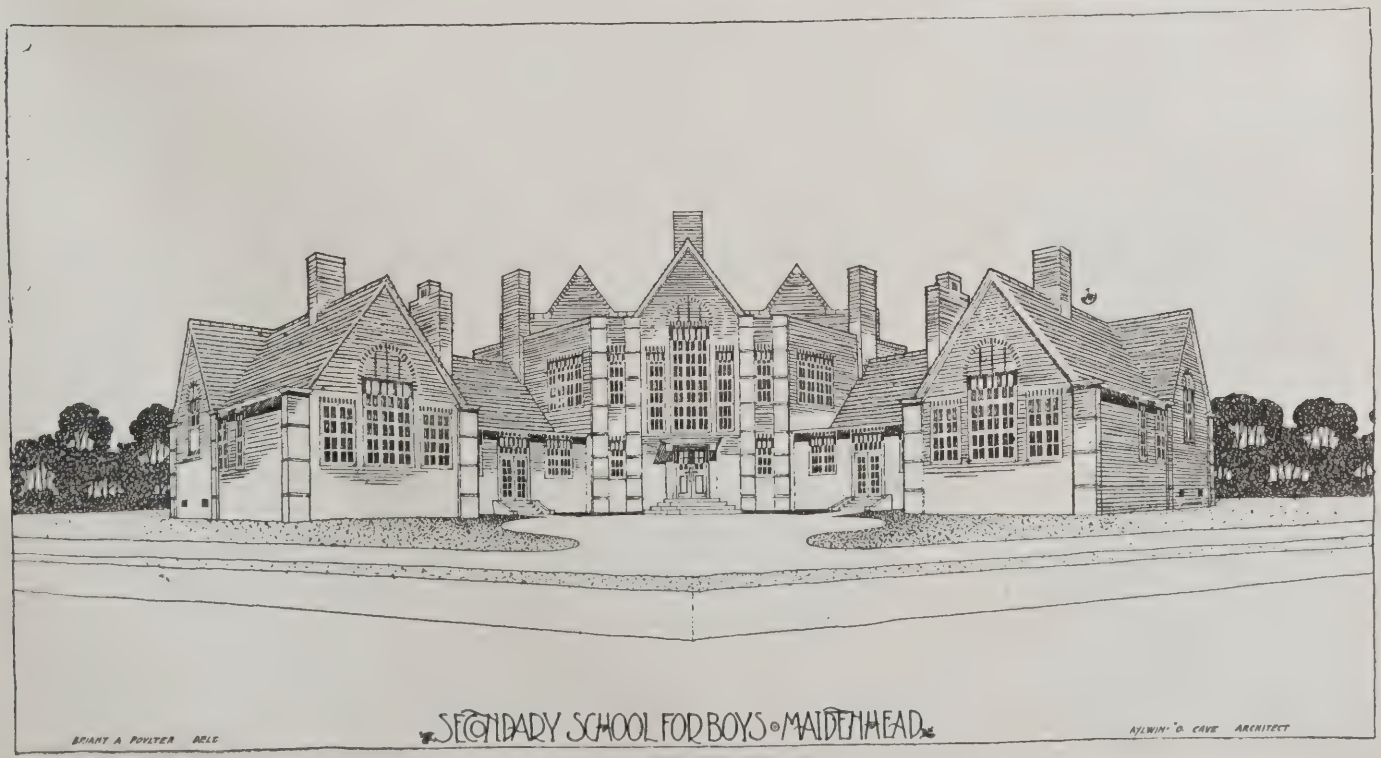
Secretary: E. J. Bigwood.

A meeting of the local conciliation board was held at the Imperial Hotel, Temple Street, Birmingham, on Tuesday, September 21st. Mr. C. H. Barnsley presided, and there were present eight employers and eleven operatives.

The business was to consider further a dispute between the bricklayers and certain members of the King's Norton Master Builders' Association, the complaint being that these builders, who were carrying on work within the radius governed by the Birmingham Association, would not work to the Birmingham working rules.

The matter was considered at a meeting of the board on July 1st, and, on the suggestion of the King's Norton builders, the matter was adjourned in order that the operatives might meet them with a view to a settlement being arrived at; but the operatives now reported that they had not been able to arrive at any settlement; hence the necessity for this meeting. After the matter had been fully discussed, on the proposition of Mr. F. G. Whittall (president of the Birmingham Building Trades Employers' Association), seconded by Mr. E. T. Barker (of the Carpenters' Society), the following resolution was passed, *nem. con.*:—"That, it having been reported to this board that certain builders are not working to the Birmingham





AYLWIN O. CAVE, ARCHITECT.

rules, within the area of that association, this board decides that the rules must be made effective within the Birmingham area."

It was also decided that copies of the above resolution be forwarded to the secretary of the King's Norton Master Builders' Association, and to the several builders who, the operatives report, were infringing the rules.

Views and Reviews.

Building Construction.*

The sixth edition of Mitchell's "Building Construction — Advanced and Honours Courses," appears opportunely on the eve of the autumn session of study. Its bulk, which apparently increases materially with each successive issue, signalises or typifies the enormous advance that has been made within the past few years in the science of building construction, and is in itself a very substantial proof of the rapid accumulation of the more or less abstruse data that are essential to an all-round acquaintance with this subject.

Mr. Charles F. Mitchell has been assisted in the production of the work not only by Mr. George A. Mitchell, whose name appears on the title-page, but by half a dozen other specialists in various departments, whose services are acknowledged in the preface. The chief alterations and extensions have occurred in the chapters relating to limes and cements, concrete, plastering, timber, paints and varnishes, brickwork, flues, fireplaces, and tall chimneys, skeleton steel construction, reinforced concrete, joinery, sanitation, and hot water apparatus and heating, and the chapter on reinforced concrete is supplemented by an abridged summary of the R.I.B.A. report on that subject. Obviously the book is extremely useful not only to students, but as a valuable work of reference for architects and builders; most of the information given is tersely and clearly put, has endured the test of time, and has undergone repeated revision.

---

*Building Construction: A Textbook on the Principles and Details of Modern Construction, for the Use of Students and Practical Men. Advanced and Honours Courses (comprising stages 2, 3, and Honours). By Charles F. Mitchell, assisted by George A. Mitchell. Containing 900 pages of Text, with about 800 illustrations, including 24 double-page plates. Crown 8vo, cloth, price 6s. London: B. T. Batsford, 94, High Holborn, W.C.

Oxide of Zinc as a Paint Base.†

There has been, within the past few years, a notable intensification of research into the nature and properties of materials. The zeal for rather severe scientific training is apparently beginning in this country to yield results that are in some degree comparable to those that have been by similar means achieved abroad, more particularly in Germany. We can now point to a growing band of well-trained and earnest workers on scientific lines, who are able to tell us more about materials than was dreamt in the philosophy of the generation immediately preceding us. Notable among those who have probed into these mysteries is Mr. J. Cruickshank Smith, who has specialised on the manufacture and application of paint, and has recorded his observations in many excellent articles and lectures, and in at least one good book, bearing the rather formidable title of "The Manufacture of Paint." He has now contributed to "The Decorator" series of practical handbooks, which are edited by Mr. Arthur Seymour Jennings, a capital little monograph on "Oxide of Zinc, its Nature, Properties, and Uses." Zinc white, long unduly neglected because it was thought to have insufficient body, is now coming rapidly into favour; and this book, by supplying exactly the kind of knowledge before which ignorant prejudice must vanish, will no doubt largely increase the popularity of a pigment that, unlike its older rival, white lead, is non-poisonous, keeps its colour in chemically polluted atmospheres, and is innocent of the peculiarly pungent smell that gets paint such a bad name. Speaking of names, it may be here useful to repeat the author's caution that at the present time, while, in the paint trade, zinc white is frequently understood to mean oxide of zinc, two totally different pigments are sold as zinc white, and it is therefore safer to employ the term oxide of zinc when that pigment is required. It will surprise many to learn that it was as long ago as 1781 that Courtois brought oxide of zinc into commercial prominence. The book is written in an interesting style, and will be found valuable to paint users as well as to manufacturers.

Of Interest to Surveyors.*

The planimeter, an instrument for computing mechanically the areas of plane figures, performing this process directly from the drawing or other surface, without the intervention of a ruled transparency, dates from the early part of the last century, the first instrument to be called by this name having been invented in 1827 by Oppenkoffer; while the polar planimeter was made known in 1854 by Jacob Amsaer, Professor of Mathematics at Schaffhausen. This is the intrument that is now generally in use, and Mr. Gray gives a thorough and lucid explanation of what computations can be made with it, showing plainly how it is that so simple an instrument can be made to dispense with intricate calculations. There are twenty-nine diagrams, illustrating the methods of solving various problems that are of special interest to surveyors.

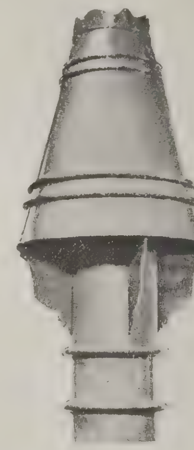
---

*The Polar Planimeter: How it is used, and how it operates. A Simple Treatise. By Frank J. Gray, A.M.Inst.C.E., etc. London: St. Bride's Press, Ltd., 24, Bride Lane, Fleet Street, E.C. 1s. nett.

Trade and Craft.

Milne's Syphonic Chimney Top.

The time is at hand when the perennial smoky chimney nuisance will assume the utmost aggressiveness. There may still remain, however, several weeks in which to take precautions against the miseries suffered in former seasons. An effectual cure, which has successfully withstood the test of eleven or twelve years' application, is provided by Mr. Edward P. Milne in the form of the anti-down-draught chimney-top shown in the accompanying illustration. The action of this chimney-top is syphonic, so that the main flue is not affected by any atmospheric depression, while the up-draught is very considerably increased. Moreover, it is noiseless, and the interior is so formed as to offer no obstruction to the chimney-sweep's brush. The down-draught nuisance is not merely a cause of discomfort to the householder. Its absolute wastefulness is evident when the cook complains that her oven will not heat, and when the engineer suffers blame and loss because the want of updraught robs his fire-grate, kitchen range, or heating intallation of their stated efficiency. That Milne's Syphonic Chimney Top is an effectual remedy for all these troubles is proved by the many repeat orders received, and by the fact that, as already stated, it has remained in constant favour for about a dozen years. Mr. E. P. Milne's address is 15, Craven Street, London, W.C.



Steel Rolling Shutters.

Messrs. Arthur L. Gibson and Company announce the completion of their new Radnor Works, Strawberry Vale, Twickenham, and that all future orders for Kinnear patent steel rolling shutters will be filled from that address. Until further notice all correspondence should be sent to the present address, 19, 20, and 21, Tower Street, Upper Saint Martin's Lane, London, W.C.

"LIMPET" PATENT BOLTS & WASHERS
FOR CORRUGATED IRON SHEETS.

"There is no doubt in our mind that they ought to be regularly specified where iron sheeting is used."—*Vide* BUILDERS' JOURNAL.

PRICE'S PATENT

The latest and most approved Fixing for joining Corrugated Iron Sheeting together.

REGISTERED TRADE MARK
LIMPET

Their great feature is the way in which they adjust themselves to the corrugation and make an absolutely watertight joint. They also retard the corrosive action in Galvanized Sheets and combine other advantages.
EXCLUSIVELY ADOPTED BY THE INDIAN GOVERNMENT, THE LEADING RAILWAYS AND MANY OF THE LARGEST MANUFACTURING CONCERNS IN ENGLAND AND THE COLONIES.

Full particulars and samples from the Managing Agents

The Technical Training You Get from the I.C.S. is individual—

practical—complete—all before you all the time! No waiting for classes. No problem unanswered. No instruction not based upon the practical experience of master experts in the line for which the instruction is being given.

You have no books to buy—no outfits to procure—each I.C.S. course is complete in itself.

If the work you are doing day by day is the work in which you aspire to excel—if your present work is the work in which you are determined to rise to a higher position and bigger pay—that is the work which you should study through the International Correspondence Schools. You cannot rise above the ordinary—you cannot get to be the man who gives the orders and gets the big salary—unless you get a thorough grounding and a complete education in the technique, the science and the "Reasons Why" of your work.

All of this the I.C.S. absolutely give you. The voluntary letters from employers and students—the amazing record of 18 years of salary-raising success the world over—are our proof. Let us send you some of this proof. Surely your future is worth the spending of a few moments and a postage stamp.

Profession and Practice.

Practical engineering problems, and those that are left to the architect to solve, being often so very closely akin, it is by no means astonishing to find, from a paper on "The Status of the Engineering Profession," recently read by Mr. G. Allan Thomas before the Society of Engineers, that the present discontents of both professions are virtually identical. It might, for example, be stated of either profession that it is overcrowded, and that in each case the plethora is due to the constant influx of men lacking sufficient scientific training, who have no great love for their work, but are apparently tempted by the ease with which a footing may be gained. Then there is the misuse of the term engineer by unauthorised persons. Is there not a similar abuse of the term architect? All sorts and conditions of men may, without let or hindrance, describe themselves as architects, and there is unfortunately no room for doubt that they can, and do, with impunity bring discredit on the name. Another topic dealt with by Mr. Thomas was the multiplication of societies. Here his principal grievance seemed to be that members "use the initials of societies other than the three principal institutions as a distinguishing mark." In the architectural world there has been observed, it is true, a tendency towards multiplication by cleavage; but among the engineers the separate institutions seem to spring into being spontaneously and independently, because engineering comprehends a large number of various interests and occupations, which naturally demand sub-division and distinct classification, although they do not appear to justify an equivalent misuse of assorted selections from the alphabet. Further, the author finds it necessary to declare that "no professional man should be allowed to advertise." He does not explain why. Nobody ever ventures on to such delicate ground. One feels that it is unprofessional and undignified to advertise, and there the matter rests. Finally, there is the question of fees. "In the absence of any legal status," says Mr. Thomas, "it is difficult to establish a scale of fees, and so to prevent cutting of prices." But the many and flagrant infringements of the R.I.B.A. scale show that to establish a scale and to enforce it are different matters. Architects are occasionally invited to compete against each other in the matter of fees, as in the following instance: "Architects are invited to send in their terms for preparing plans, working drawings, specifications, bills of quantities, etc., and for superintending the carrying out the erection of a proposed new school at ——. The commission must include the preparation of the necessary plans and specification for the Board of Education, the Local Government Board, the Education Committee, the builder and clerk of works, and must be finally approved of by the Board of Education and Local Government Board; also copies of the bills of quantities for the builders tendering for the works. No commission will be allowed on furniture to be supplied to the schools." The lowest bid was $2\frac{1}{2}$ per cent. on the cost. Two competitors thought this remuneration adequate; the gentleman whose offer was accepted presented excellent credentials, and stated, we are informed, that his charge included travelling expenses. One competitor thought the work worth $6\frac{1}{2}$ per cent.; another 6; three others, 5; one, rather curiously, $4\frac{3}{4}$; and there were two at $4\frac{1}{2}$, three at 4, and one at $3\frac{1}{2}$, or, alternately, at $2\frac{1}{2}$ if the cost exceeded £5,000. This seems to suggest that the scale of fees established by the R.I.B.A. is but little better than a pious aspiration; and, further, that professional organisations, whether of engineers or of architects, might do worse than borrow a lesson or two in discipline from the much-despised trade unions, which at least have the courage to enforce the rules that they see fit to make.

Decorative Ideals.

A strong and fearless idealist is invaluable to his day and generation. His contentions — or, rather, his dogmatic assertions—may seem to be for the moment visionary, and incapable of being translated into practice; but if they are in fact a revelation of the means of betterment, as well as a counsel of perfection, the idealist does not demonstrate and exhort in vain. Always providing he has earned the right to preach, and can do it eloquently, he is sure of attentive listeners, some of whom will gladly embrace his gospel. Such a preacher is Sir William Richmond. He is, on his record, fully entitled to lecture us, and he has, in his time, cleared both the physical and the spiritual atmosphere of much obscuring and injurious smoke. The National Association of Master House Painters and Decorators were no doubt proud to have him among them at their convention at Sheffield the other day, for is he not a "brother brush"? and, on the whole, he said but little that could have made them feel poignantly sorry for their sins. On the other hand, his advocacy of simplicity and paint—and plenty of both—must have touched a sympathetic chord in their hearts. His suggestion of "a long settee, made of pine, painted an agreeable colour, and furnished with a mattress and plenty of cushions," probably evoked applause; but they must have felt a little dubious about the profitableness of his eloquent eulogy of lime-whited walls. "Both photographs and prints tell best on a white wall. . . . On the whole, the most effective, the healthiest, and the pleasantest room to live in is a white room. There is no white so pure as lime; no product is so successful in the slaughter of offensive animal matter. Lime is cheap and efficient. Every coloured object, save dark ones in large masses, looks well upon white, which, in my opinion, is the safest of all tints to use in large quantities." But whitewash, and plenty of it, does not comprise the whole art and duty of the decorator. "A very little ornament, skilfully applied in pale and quiet tints, will look beautiful on a white ground." White walls, moreover, are "exhilarating to the nerves, and are a constant æsthetic companion." Do white walls show the dirt? So much the better. You will be the more likely to clean it away! Sir William's peroration was worthy of Ruskin: "You must combine together, not to aid and abet the vulgar elements in a commercial age, but to emancipate it from further degeneracy by being apostles of rich imagination" (here we try very hard to forget the whitewash), "and of cultivated experiences, who, having learned the great lessons which are the foundations of all good art—reserve without pedantry, beauty without sensuality, gaiety without affectation, simplicity without prudery—will surely win." But, unfortunately, the apostles of rich imagination have to emancipate from further degeneracy "the middle class of town-bred folk . . . whose egotism is a faculty," and who are "self-sufficient, self-occupied, and inelastic." Their æsthetic sins are as scarlet. Would whitewashing suffice them?

Competitions Again.

We draw attention to the particulars, in our list of "Competitions Open," of the competition for the best plan and specification for a farmhouse and outbuildings, to cost about £400, instituted by the Pembrokeshire Small Holdings and Allotments Committee. In the ordinary way the architect's fees for such a work would amount to at least £20; and if the job was not proceeded with he would be entitled to the sum of £10. But the committee offer the munificent sum of £5 5s., and the plan and specification are to become their absolute property. From this one may presumably infer that the committee have no intention of paying the successful architect more than the sum mentioned, or of employing him to carry out the work at his usual and proper remuneration. Further, it is not only possible but rather probable that the committee intend to duplicate these buildings for all holdings in their jurisdiction for which they are suitable, and this without any further remuneration to their designer. It should also be mentioned that the selection of the best plan and specification "shall rest solely with the Council." It is perhaps only kind to assume that the committee are instituting their first competition, and that they are unacquainted with the proper conditions for competitions or the scale of fees upon which architects work. Nothing else would explain the preposterous nature of the conditions as they appear to architects. As it is the Pembrokeshire Small Holdings and Allotments Committee are inviting architects to waste their time preparing sets of plans and specifications from which one set will be selected without the aid of an assessor, and for which a payment is to be made 75 per cent. less than the proper fee. Moreover, this same design may be duplicated ad infinitum with no further remuneration to the architect. If the committee persists with the present conditions, the Royal Institute should intervene in no uncertain manner.

Paris By-laws and Outlaws. Paris would appear to be less a paradise than a purgatory for builders; a little of the former, because of the laxity of the by-laws; a great deal of the latter, because of the ferocity of the workmen. A large number of the roads are at present "up," and, according to a newspaper correspondent, "nearly every public square is disfigured by palisades and yards, which almost look as if they were intended to be permanent." A commission of the Municipal Council has shown that many of these erections are entirely unnecessary, and are due to the heedlessness of the contractors. The by-laws seem to be badly in need of revision, since it now seems that a builder may, with impunity, in a crowded street, "erect his scaffolding on the pavement and monopolise its whole breadth without attempting to provide any accommodation for foot-passengers, who are driven into the road among the motors and horses." It seems, however, that for this state of things, the blame is not wholly with the builders, who are the victims of an epidemic of strikes. In Paris, it is almost impossible to fill the places of the strikers. If the contractor gets a few men on the job, the unionists' organ, called, with delightful irony, "Humanite," publishes an announcement that the "chasse aux renards" is open ("renards" being the French equivalent for "blacklegs"), and the result is an immediate siege of the works—not in the way of "peaceful picketing," but after the manner of the most exhilarating traditions of Donnybrook. In order to avoid bloodshed and devastation, the contractor must wait patiently until the strikers think fit to resume operations. "A good instance of the pernicious effects of these strikes," says the Paris correspondent of the "Morning Post," "is given in the case of the Rue Notre Dame de Lorette. For nearly two months this road has been completely blocked, and for about five weeks all work in it has been abandoned. A large hole—about 30 yards long, and 8ft. or 9ft. deep, has been excavated in the centre of it, and this hole takes up not only the whole breadth of the road, but also the space formerly occupied by the pavement, which has been replaced by shaky planks. The purpose of this excavation was the strengthening of the roadway over the Metropolitan Railway with iron girders. Since, however, the men who were placing the girders in position are on strike, nothing can be done. The shopkeepers, who are losing all their business, had made many protests, and it has now been decided to fill up the hole without carrying out any of the proposed work." When the strikers condescend to return to work, this curious game will probably be played all over again. Even when they are not idling, the workmen are apt to render themselves peculiarly obnoxious. "You are doing too much work," said one to another, the other day, and knocked him down. This savage was sentenced to a month's imprisonment; but minor assaults, which are allowed to go unpunished, are so common as to attract but little notice. Altogether the Paris master builder is having a very lively time. More thorough organisation, on the lines of the British Federation, would perhaps be effective in bringing the men to a more reasonable frame of mind. The French workmen, for lack of adequate facilities for meeting their employers in well-ordered conclave, resort to violence as the most effective means of presenting their case and demonstrating their force. On the other hand, the employers are too fond of treating them like waywardly naughty children. The national temperament is so different from ours, that it is questionable whether the adoption of our "fair-and-square" methods of settling disputes would prove effectual; but they might be given a trial, for it is unquestionable that our system of holding properly constituted joint conferences has proved to be a splendid means of education and discipline to both parties.

Essential Unity. In another part of the present issue we print what in effect is an eloquent plea for the unification of building interests. It emphasises to some extent a remark made in a foregoing note on some common discontents of architects and engineers. The component elements of the great industry we represent would find it profitable to draw more closely together, to study each other's interests more sympathetically, to co-ordinate and thus render more effectual their scattered forces, professional, educational, and industrial. Half the mutual jealousies and antagonisms, and most of the deplorable waste of energy, that are only too evidently rife in the building profession and industry, would disappear upon a frank acceptance of the truth that we are members one of another, and of the obvious wisdom of pulling together instead of against each other. In the very striking article to which reference is made, the value of this Journal as a bond of union is generously acknowledged. This is a point upon which we do not wish to lay undue stress; but nevertheless we cannot conceal our satisfaction that the writer of the article in question recognises so frankly the effectiveness of the efforts we are making to secure the objects which both he and we consider to be so eminently desirable. It is our steadfast endeavour to deal with building interests comprehensively rather than sectionally; and in the steady pursuit of this policy we have been successful almost beyond expectation in demonstrating the utility of an organ that is fully representative of the industry as a whole. To the architect, the builder, and the merchant, we afford the means of meeting on common ground, and hence of acquiring a fuller knowledge and a better appreciation of each other's work or product or point of view. All this must make for progress and amelioration. We do not pretend that to bring the various interests into touch with each other is all that is necessary for the consolidation of mutual interests; yet certainly, as the writer of the article so clearly shows, the services that only a fully representative organ can render are of vital importance to that desirable object—constituting, in fact, a cardinal condition precedent to prosperity and progress; and it must be very evident that, within reasonable limits, breadth and comprehensiveness must increase not only its interest, but its strength, utility and influence.

Urban District Urbanities. That the members of urban and district councils have beautiful minds and polished manners is well known to the architects and builders who, for their sins, are occasionally brought under the light and pleasant yoke of these august bodies. Teignmouth Urban District Council appears to be a singularly Chesterfieldian or Grandisonian assembly—a miracle of district urbanity. At a recent meeting, in which sea-front defences, and incidentally the respective powers of the surveyor and the clerk of works were discussed, some extremely delicate and well-turned compliments were exchanged. One polite member said to another, "You are a vindictive individual." This, though neat, was apparently less exquisitely refined than certain compliments with which the same member had been loaded at previous meetings; for he said, "You told me I was a miserable humbug and a nuisance at every meeting." The credit for these amenities was not denied; and the author of the verbal caresses showed that he had not exhausted his pearls, nor forgotten his suavity, for while the object of his undisguised admiration was speaking, his constant and consistent admirer amiably observed, "He is a humbug. He is nothing more. Tell the truth about it. You are a prevaricator." The last sentence is so delicately circumlocutory that one half-suspects that it is meant to conceal some subtle innuendo. In the course of the debate, one gentleman remarked directly enough, yet with touching modesty, "We are a set of mugginses and jugginses all the way round." As no one accused *him* of being a prevaricator, it is not for us to challenge the accuracy of his observation. Not that these domestic endearments are any particular concern of ours. We merely call attention to them in the faint hope that they may happen to shed some light on the remarkable growth of taste and refinement of which we hear so much, and on the suave and graceful courtesy with which architects and builders are invariably treated by public bodies. It may be wrong to assume that Teignmouth is quite typical, or that the average member of that body is up to the high standard of the two or three members whose gems of thought we have been delighted to quote from the local newspaper; but it is well to know how we are governed, and such instances, although trivial in themselves, have a cumulative value in helping us to a more thorough appreciation of the wisdom of our councillors, and to more of reverence for the dignity of their office. Heigho!

ARCHITECTURAL TOPICS.

Substance of Presidential Address by Mr. Henry Tanner, F.R.I.B.A., to the Architectural Association, on October 8th.

After introductory remarks expressing his sense of the honour and responsibility of the position to which he had been elected, and a high tribute to his immediate precursor in the chair, to his brother officers, to the Council, and to the permanent staff, Mr. Tanner said that the duties of all honorary officers must have been very heavy before such a well-organised staff had been developed, and he often wondered how the duties of the Architectural Association's President of forty or fifty years ago varied from those which have now to be undertaken. I suppose (he said) the educational branch is the largest item, apart from the fact that the number of members is nearly doubled and the necessary incidental work thereby entailed greatly increased.

Our total membership this year shows a slight decrease, as we have had 132 resignations and losses, as against eighty-four new members, and I am very sorry to say that we have lost by death several old and very valued members—Mr. Gruning, who was so universally respected, probably his name appeared in the bulk of cases during the last few years as arbitrator or third surveyor; Mr. J. W. Penfold and Mr. Cole Adams, former Presidents; and Professor Hulme, who for a long time was a valued member of our lecturing staff—are only a few of those whose loss we have to deplore.

This decline in our membership I attribute to the very long period of depression through which we are at present passing, and which is affecting so very adversely the most important trades in this country, among others the building trade; of course, architecture suffers at the same time.

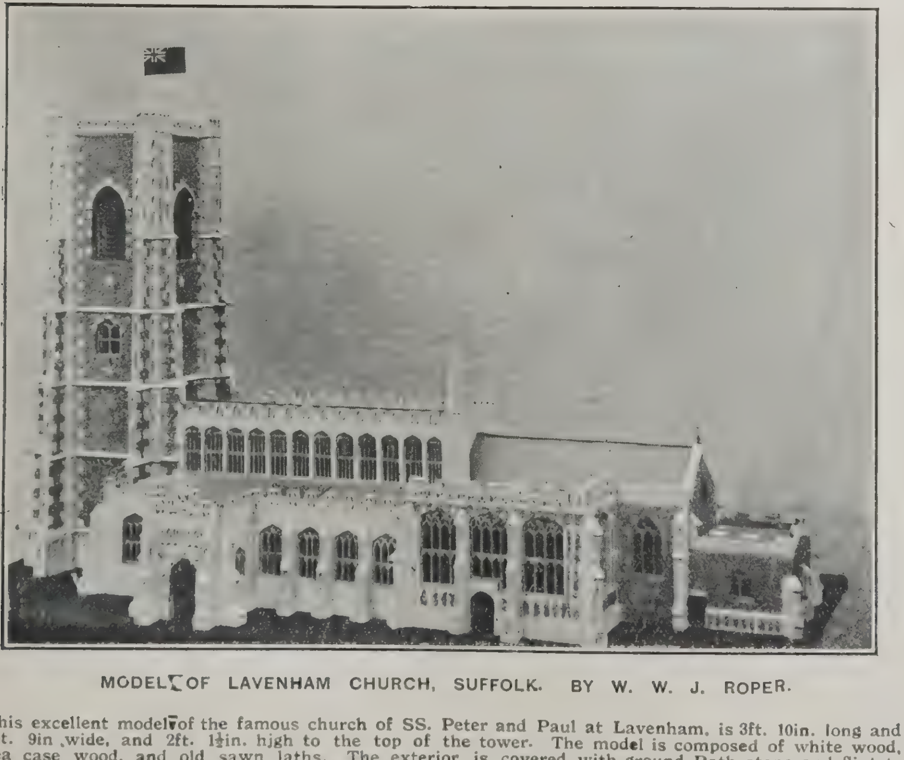
It has occurred to some of us (Mr. Tanner continued) that there is not enough social life in the Architectural Association; that we meet so almost entirely in working hours, and consequently so seldom in moments of leisure, that the men of various decades do not get to know one another, and we should like to see more of the men who no longer wish to come here to study. We are thinking of flattering the Royal Institute in the sincerest form, i.e., imitation, by copying—on a smaller scale, of course—the "At Homes" which have proved so successful with the senior body.

Of the many branches of the Architectural Association, the educational is, of course, the most important, in fact, the whole organisation is being run more and more with this department in view as the main object. Since our school was started, more have sprung up in every direction, and I see that one is now being started in Birmingham, and when there are enough schools to educate the majority of those seeking an architectural training, which time rapidly approaches, I imagine there will be ample support to the proposition put forward in the papers a short time back, of a Diploma course in architecture, and over which there was a great amount of discussion; the different schools naturally shape their studies on varying lines.

Our students' exhibition of work this year was a very good one, a general level of excellence being maintained, which always speaks well for both masters and students. Mr. Maule, Mr. Varndell, and all the other masters work most conscientiously for the welfare of the students, who in turn must, I am sure, ably second their efforts to produce some of the work we have seen, and I am confident that in our two years of day school study, and two of evening school, the students receive a very valuable and sound grounding in their work, which must be most useful to them in after life; but there is no doubt that our curriculum could with great advantage be followed up and amplified by the course of higher studies, which cannot be embraced in the short time at our disposal here.

The Camera and Sketching Club is a flourishing department of the Architectural Association, and the collection of slides, now numbering 4,000, contains examples of almost every style of architecture, and is of the utmost value to lecturers and readers of papers, and I venture to think there are very few subjects connected with our profession which could not be illustrated, to some extent, from the collection.

Remarking upon the success of the Athletic Club, which now numbers more than 200 members, Mr. Tanner said that he hoped to start a golf section this winter, and as the game has now become so popular, he thought that there would be no difficulty in getting together as good a side as in all the other athletic branches.



MODEL OF LAVENHAM CHURCH, SUFFOLK. BY W. W. J. ROPER.

This excellent model of the famous church of SS. Peter and Paul at Lavenham, is 3ft. 10in. long and 1ft. 9in. wide, and 2ft. 1½in. high to the top of the tower. The model is composed of white wood, tea case wood, and old sawn laths. The exterior is covered with ground Bath stone and flint to resemble the Casterton stone and flint of the original. The tower is built up of 1,073 pieces, and the body of 2,497 pieces of wood, or a total of 3,570, all the woodwork being cut with a hand fretsaw.

Having passed in review all the forms of activity of the Association, Mr. Tanner turned to the happenings of general architectural interest during the past year. Among these the Housing and Town Planning Bill is one of which we were led to expect a great deal of good, but the more recent legislation which is being framed with regard to land taxation would seem to have a malevolent influence on the maintenance of open spaces in towns, at any rate, by private people. It would have been much more satisfactory if the disinterested offer of help from the Institute had been received in better part by the authorities in charge of the Bill, for if there is one thing on which the heads of our profession should be consulted it is surely this, and a good architectural result might then be obtained quite compatible with sound engineering requirements and a satisfactory financial result.

The Patents Act has benefited us to some extent, owing to the factories which now have to be put up here by the foreign owners of patents registered in this country which now have to be worked here, but on the whole there is a decided tendency just now to leave building alone until some clear idea is obtained as to the final imposts which land will have to carry.

We are to have further legislation by the London County Council under this year's General Powers Bill, in which the claims of steel as a reliable building material are properly recognised, and it allows the erection of steel-frame buildings throughout, i.e., instead of the thick outer walls formerly required, we may now have thinner panelled walls with steel framing; but, on the other hand, the internal structure is now to be subjected to further supervision, this part of the building being rightly held to be an integral part of the outer shell, whereas with the brick outer shell such was not the case; but a heavy responsibility is being laid on the London County Council and the district surveyors, as they will be answerable for the stability of the new type of building, and I fear some amount of time must be lost in getting plans approved, and time is a factor on which our clients nowadays never fail to lay the greatest stress, and I must say I am inclined to think that taking the responsibility from the architect is a mistake; it means the work being done twice over and taking a large amount of interest out of our work, as the architect should be the author of the entire building, including the structure.

The strides made in ferro-concrete, which is recognised as a subject of future legislation in this Bill, have been prodigious, and though up till recently this type of construction has been utilised chiefly for engineering work, its influence is now being felt in our architecture, and this opens up a very wide question for consideration, for if this medium is going to be, as I think, the one utilised in our larger architectural works, we shall either have to take up the study of this form of construction with its attendant possibilities, or we shall find there will come into existence a ferro-concrete specialist who will take over the general construction of the building, and the architect will be relegated to the decoration of the interior and the design of the exterior.

This raises a point of supreme importance which we are sometimes inclined to overlook, we must design our work to suit modern conditions. It is impossible to insist on the acceptance by the public of the type of work which was suitable even twenty or thirty years ago; we have to face the problem and accept the present conditions and endeavour to treat them architecturally.

I am referring here, of course, to the large commercial buildings in our cities, but in domestic work we have a freer hand, as the habits of life in the home can never change so thoroughly and so quickly as in the world of business. Why should not good architecture be produced with modern materials and to suit modern users? The steel column and beam are accepted facts—why hide them with an arch and a dummy pier? Why should not our constructions be shown in our designs instead of being hidden or obscured as much as possible? There is no doubt that we shall have to evolve a new method of treatment for the modern types of construction unless we are going to be content to let our architecture be a mere shell or screen of stone or whatever material we may elect to use, pegged or hung to the structural members, screening these from view without indicating their underlying form, as should surely be the case.

No one can fail to be struck by the general improvement in the attitude of the public towards town architecture of late years; planning of streets and open spaces has received so much more consideration, and the relation of individual buildings in connection with streets and adjoining work is not now so consistently disregarded. The average Britisher, to borrow a term from the other side, now takes a broader interest in architecture, and his horizon is not bounded by the particular buildings in which he lives or works; and as he educates himself the book opens, he knows the good from the bad, and begins to appreciate the former, and thereby creates a demand for that which we have to educate ourselves to supply.

With reference to domestic work, we have many men carrying on that high tradition in architecture for which England is justly famous, and I think we may congratulate ourselves in attaining a very high general standard at the present time; the public will not have the house which satisfied them a few years back, so even the speculating builder has to produce houses more consistent with the accepted canons of art than those he formerly flaunted in our faces. In this connection I should advocate the assistance, but not the entire control, of the woman in architecture, for I feel sure that the wider architectural field is not one for which the woman is particularly adapted, but in domestic work she would be a very valuable ally.

As to registration, I myself am in favour of it. Of course no scheme of registration can elevate the art of architecture; but it seems to me that it certainly cannot do it any damage, and incidentally is sure to eliminate some of the undesirable, and might put us on a better recognised footing; but before we can be better we must be worse in such an all-embracing scheme as it must be to become law. Many self-styled architects must be included in the roll, but that is or should be the end of this class except so far as the public care to trust any unqualified man when they know that qualifications are essential. Before we can get satisfactory registration we must become a united body, and the advocates of the extreme views must moderate them. But one thing is quite certain, the movement cannot be rushed as one party at the moment seem to desire, as no Bill would stand a chance of becoming law if opposed by any considerable section of the same profession as the promoters; but I venture to think that the anti-registrationists are lessening in number, and I feel sure that they, being mostly in the forefront of the profession, will not stand in the way of a movement that so many think would improve our lot, although they themselves have succeeded in spite of the present position of affairs. There is, to my mind, one most essential factor, and that is loyalty to the central body—I mean the Institute. If this point was now generally realised the advantages to the profession would be immense; until nearly, if not all, architects belong to the Institute, the Institute in turn cannot put forward its views as those of the profession at large, and those architects in favour of the movement who refrain from supporting the central body are only weakening the cause of registration, and not advancing it.

I have often wondered lately if the brilliant draughtsmanship of the day, unless carefully guarded against by the student himself, may not have a derogatory influence on design; a too fluent pen or pencil is liable to run away with the happy possessor, though at times I admit he is wont to rise to far higher flights of fancy than the man less gifted in this way; but the product of the literary man's pen is his finished work, while the drawings of an architect are only means to an end, a step towards the building itself, and what looks well on paper, when drawn as well as some of you can, is liable to be misleading and less satisfactory in actual execution; therefore I would say, do not be satisfied with designing on paper without knowing the value in actual concrete form of the lines you put down, and the only way to know this is to take every opportunity of observing in actual work the value of different treatments, groupings or mouldings, and imagine how you would represent them on paper.

I noticed recently in one of our periodicals [it must have been in the 'Builders' Journal," p. 142, August 25], a short article on London as seen from the trams, of which I believe there are about 400 miles, in which the author remarked what a good knowledge of our city could be obtained in this way, and what a valuable asset that knowledge was. How true this is, and how little most of us know of this big city in which we live, when you consider that you can now ride on 'bus or tram, from east to west or north to south, over the 117 square miles covered with buildings in the Administrative County; you can imagine what a panorama of architecture and building is spread before you, an open book seldom read through; but study every page, good, bad, and indifferent, sum up and analyse every example before you, find out why a building strikes you as good; is it mass, colour, detail, or some fresh note in composition which has been struck? Consider even the works which do not impress you favourably; there is something good in most of them. I would say, criticise kindly, look for the good in all and not the bad, hesitate to say to yourselves how much better you would have done it; you never know the limitations, the troubles, the laws, the bylaws, the client's requirements with which the man who was responsible was hampered, and whether under similar circumstances your own work would have compared so favourably with it as you are inclined to think.

The difficulties that beset the path in actual practice, especially in large towns, are legion, quite apart from the matter of design, but these special requirements are increasing every day, and they must all be known to us before we can give of our best, for they will probably affect our designs very considerably; but if we strive earnestly to do the best that we can in every case, even though others at first seem too far ahead, in the end the earnest worker always gets his reward. One form of genius has been described as "an infinite capacity for taking pains," and the man of that type is never far from the winning-post at the end of the race.

Discussion.

Mr. Walter Cave, the retiring president, in proposing a vote of thanks, observed that the honour which had been conferred upon Mr. Tanner was thoroughly deserved. For many years Mr. Tanner had been actively connected with the Architectural Association, and his record was surely one to be proud of. Only those whose task it had been to deliver a presidential address could judge of the many difficulties to be encountered. Mr. Tanner, in spite of the very serious depression he had had to record, had delivered himself admirably of the somewhat onerous duty. The serious and dominant note of the address was that of finance. For years past they had been accustomed to think of the Association more than paying its way; he could, therefore, only attribute the present financial trouble to the unsettled condition of the times. He hoped that if retrenchments were to be made, the teaching staff would be in no way affected. He sadly noted a deficit in regard to the A.A. play. He hoped that in future, should the feature be continued, something a little less elaborate would be attempted. With very great pleasure he proposed the vote of thanks.

Sir Aston Webb, in seconding the vote, remarked that Mr. Tanner's long and extensive experience had marked him out for the honourable position of president of the Architectural Association. It was a matter of some gratification for him and Sir Henry Tanner to contemplate their respective sons taking so large an interest in the work of the Association. Mr. Tanner having been trained in his office, it was a great delight to witness his success. In the prize list he had noticed a number of names famous in the annals of modern architecture—doubtless, the younger generation following in the profession of their fathers. This would seem to argue that, after all, architecture was not exactly the hopeless thing it was represented to be. In one respect he failed to lament the decrease of membership. The profession was already enormously overcrowded, and any sign of relaxation, although perhaps detrimental to the finances of the Association, should be greeted not with lamentation but with joy. The sister arts were not so closely associated as he would wish. The Royal Academy, he felt sure, would be willing to greet any overtures for a greater intimacy with encouragement. Regarding the papers that were an important feature of the A.A. programme, he sadly regretted the meagre attendance. Perhaps, if the papers were condensed a little, and a larger amount of time were devoted to discussion, their popularity would increase. He hoped the A.A. would never lose its youthful character. It was essentially an institution for expanding youth. He heartily seconded the vote of thanks.

Mr. W. H. Seth-Smith, and Mr. J. Osborne Smith, having supported the vote of thanks, Mr. Tanner replied, and the meeting terminated.

THE GUILDHALL, LONDON.

The London Guildhall is undergoing thorough cleansing and renovation, and many of its quaint beauties which have been hidden for years are now disclosed to view. Grime and soot have lain heavily on the interior mouldings, but now their real character may be observed. The walls, which were once supposed to be of Purbeck, but are now declared to be built of Godstone stone, have been washed down to the marks which are supposed to be connected with the Great Fire of 1666. It has been known that such marks existed, but they have not been visible for 30 or 40 years. In the course of the cleaning an interesting old porch entrance to the crypt which has remained boarded up for half a century has been opened. The crypt itself, which dates from 1411, has also been improved by the scouring of the vaultings and the distribution of electric light in such a way as to give the necessary illumination without interfering with a proper view of the lines of the masonry.

With respect to the recently discovered windows at the Guildhall, described and illustrated in our issue for Sept. 29th, it is pointed out that the discovery was by no means "accidental." The windows were traced in consequence of the appearance of the exposed masonry, and, from first to last, there was nothing accidental about it.

To provide further needed accommodation the City Lands Committee are proposing to erect over the one storey building on the east side of the porch of the Guildhall three more floors of offices. This addition would have the welcome effect of restoring the symmetry and balance of the front as originally built by Dance. It will be recollected that the east side was taken down by the late Sir Horace Jones when he built the library.

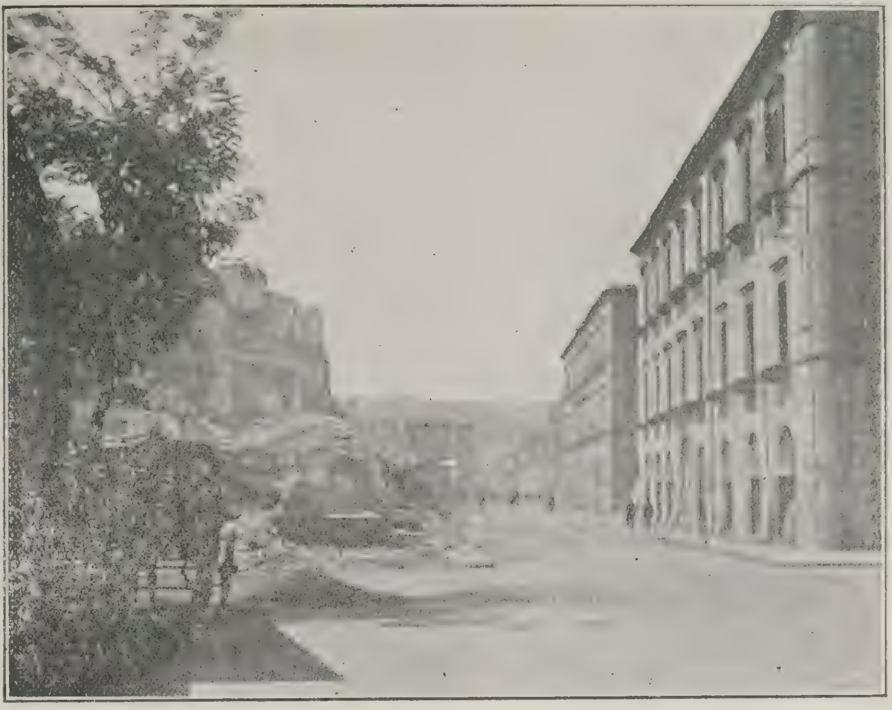
A Bradford journal is congratulating that city on the fact that the sandstone of which Bradford is built resists the action of the atmosphere in smoky cities. The stone blackens, but it does not rot under the acid influence.

STRUCTURAL LESSONS FROM MESSINA.

By A. G. H. Thatcher.

Messina is a ruin, not with the mellowed raggedness of natural decay, but with the rasping jaggedness of devastation. The collapse is complete, but it is as yet too early to say whether or not it is final. On several occasions a similar fate has overtaken the city, and phœnix-like she has risen upon the ruins of her old foundations. The probability is, however, that the city will be re-erected, perhaps in time to be again overtaken with similar disasters. To what extent history will be repeated will depend largely upon the lessons learned from the recent disaster, and on the extent to which practical effect is given to them.

That the city cannot easily be moved away from its present situation is self-evident. Its situation as a port will be a factor against any such proposition, although a difference of a few miles, by removing the town from the particular earth strata upon which it now stands, would introduce an element of greater safety.



MESSINA: A GENERAL VIEW OF A CLEARED STREET.
The houses on the left have been finally demolished by gunpowder, and those on the right are to follow.

A reference to the map, p. 280, will give an idea of the general plan of the town and its surroundings. So far as consideration has been given to the replanning, a suggestion has been put forward that the block of property between the Corso Vittoria Emanuele, which forms the quay side of the city, and the Via Garibaldi shall be entirely removed so as to give increased width to the sea frontage. Some modifications were, however, made to this idea, and the modifications have again been remodified. So that no detail can be considered settled. One might almost say that this method of procedure is in accord with the southern temperament, except that such forthcomings are not unknown even in more northerly latitudes.

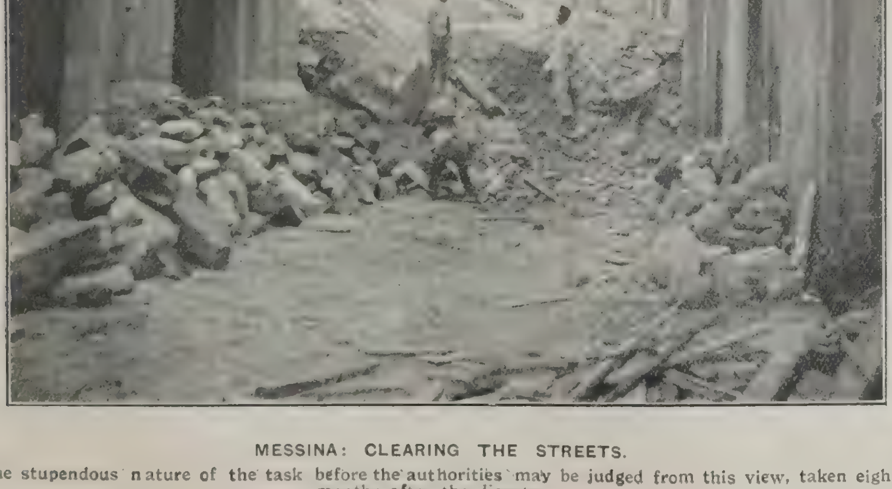
Of the principal buildings, the majority are in absolute ruin. The Cathedral (figured 1 on square E4) has only the wall standing. It is now, in view of the relics of antiquarian and other value on the premises, in the hands of the Government officials and closely guarded. Much of the material will doubtless be of use in the restoration, and it will doubtless ultimately present much of its former appearance. Of the churches, the St. Andrea Avellino, 2, E2, St. Anna 3, E4; St. Annunziato dei Catalani 4, E4; St. Annunziato dei Teatini 5, E3; St. Maddalena 9 E5; St. Maria del Carmine 10, E4; and St. Mecolo 12, E3, are quite destroyed.

St. Francesco d'Assisi 6, E2; St. Gracchino 7, E3; and St. Gregorio 8, E3, are less badly damaged, and the St. Maria della Scala 11, E2, is in still better order.

The Palazzo Brunaccini 15, E4, and Palazzo Municipale 16, F3; will have to be rebuilt if so desired in their entirety, and the Palazzo Reale 17, E2 is in little better condition. The post and telegraph offices and the University have also suffered severely. The ordinary dwelling houses present many aspects. With some the outer walls of a block have fallen. In other instances the opposite has occurred, the walls standing in a dilapidated condition with the interior gutted.

Practically none are habitable. That part of population which is left in the place are by now receiving the full benefits of the moneys subscribed for their assistance. The black squares, p. 279, show the location of the new town which in appearance suggests a mining village of mushroom growth. The houses, or more correctly, huts, consist of two rooms only, with in some instances a small scullery attached. They are entirely detached, built of matchboarding and timbers and stand upon a brick foundation, as shown on p. 284. The huts are not tied down to the brickwork in any way, the theory being that in the event of another shock, less damage is likely to be done if no such connection exists. The same principle is used in the construction of the new hotel p. 283. Owing to the difficulty of using the camera only part of the front and one wing of this building is shown. This difficulty was experienced with many of the photos taken, giving in some cases a somewhat erratic perspective. A temporary school and church house is also nearing completion, but a slight difference is noticed in its construction. The brick foundations in this case are not continuous round the building, but brick piers only are built, about 2ft. above the ground, at all angles to the walls of the building, and at suitable distances apart. The framework of the structure is carried upon timber plates running from pier to pier. As will be seen later the idea of having no connection between the structure and the foundations coincides with the theory put forward by Mr. W. W. Beaumont at a meeting of the Institution of Civil Engineers on December 22, 1885; that one system of building in earthquake countries was a method which would allow the structure to move a little.

The new town is divided into two sections on the south, being known as the American and Italian quarters. The streets are laid out regularly, and a general appearance of neatness is observable at present. The sanitary arrangements are necessarily primitive, and considerable care will have to be exercised to keep the same in good order. Cleanliness in fact is imperative, and will demand particular attention, especially as



MESSINA: CLEARING THE STREETS.
The stupendous nature of the task before the authorities may be judged from this view, taken eight months after the disaster.

the population is not of the higher social scale, and in addition, of course, street paving does not exist. On p. 282 is a typical view of a street in the Italian quarter.

A few more substantial buildings are being put up in the cleared portions of the town, chiefly by the Italians. On p. 284 is an illustration of an example in brick with the upper part cemented over. No attempt is as yet being made to carry brick structures more than one floor high.

The work of clearing the town is proceeding apace. The immensity of the task will be understood when it is known that only two houses in the town successfully stood the shock. On p. 283 is a view of the Villina Lanzara, one of the fortunate pair. The photo was taken from the bottom of a slope, and is therefore somewhat out of perspective, but it will be seen that the house is of particularly solid construction, being largely of Syracuse stone on lava stone footings carried 3ft. above the ground level. A few slight cracks developed during the disaster, but were ignorable when considering the stability of the house. It was of two floors only, and, in proportion to its height, of considerable area. The upper windows are of arched construction, which it will be shown later appears to be a method particularly useful in earthquake countries.

The cross hatching on diagram p. 281, shows the part of the town to a large extent yet uncleared. On p. 279 is an ordinary scene in that district at present. The gangs work in small parties, each being watched by an armed guard. Such material as may be useful is sorted out, and the remainder is removed in trucks on light rails and shot into the sea. Such portions of the buildings as may be left standing are then blown up, and the debris is again sorted over. On p. 279 a street partially cleared is shown, the houses on the left have just suffered from the effects of dynamite, and those on the right which are gutted internally are to follow.

Before considering the different types and methods of building, and how each withstood the shocks, it will be as well perhaps to detail shortly the views upon this subject put forward by Professor Milne and others at a meeting of the Institution of Civil Engineers previously noted. Professor Milne suggests that in the avoidance of destruction it seems that stresses and strains applied horizontally have chiefly to be dealt with, and not so much stresses and strains due to gravity. As an illustration, he considers an ordinary masonry arch. For vertically applied forces this is stable, whilst for horizontally applied forces its stability solely depends upon the adhesion of the material which holds it together. The Professor made many examinations of brick arches that suffered shock in Japan, and found that the effect of the horizontal stress depended chiefly upon the direction of the shock. A crack was found to develop at the crown of the arch when they ran in the direction of the earth movement, but the arches stood when at right angles to this. From this he argues that arches of this description should always be protected by iron or wooden lintels. If arches are indispensable, they should curve into their abutments, and not meet them at an angle, the angle being a point of weakness. This was well borne out by his examination of 330, similarly built brick structures at Tôteiô, where the upper windows had flattish arches, meeting their abutments at an angle. Of 127 cracks in these arches no fewer than 113 ran from the angle. Not a single arch was observed to be cracked at the springing when the arch curved into its abutment.

As another illustration of a structure weak in resisting horizontal forces, the high wall of a factory may be taken, or a church tower which contains a series of openings like windows and doors vertically above each other. These openings may constitute a line of weakness, and the wall may give way here at the time of an earthquake, as was illustrated in Manila in 1880.

The evil effects of overloading the upper part of a structure were also noted in the address. For instance, when a chimney with a heavy top is suddenly moved forward, the upper part by its inertia tends to remain quiescent. The result of this as with all other heavy superstructures is to cause a fracture between the lower part which has been quickly moved and the upper part which has tended to remain still. Weighty tile roofs have the same effect upon supporting walls as heavy tops to chimneys.

In conclusion, Professor Milne says the most important principles to be followed are: First to provide against horizontally applied stresses, secondly to allow all parts of the buildings with different vibrational periods either to have freedom amongst themselves or else to bind them securely together with long steel or iron tie-rods, especially at floors or near corners, as corners of buildings often suffer in earthquakes. Thirdly to avoid heavy superstructures.

The English cemetery is situated on that particular portion of the city which, with its continuation, forms the harbour, being shaped in the form of a sickle. Being thus exposed, the cemetery suffered severely from the effects of the wave which immediately followed the earthquake. The boundary walls were thrown down, and most of the tombstones were lifted and thrown about like so much driftwood. Considerable care has been taken by the British Consul, Mr. Baylis Heynes, to restore the cemetery to some degree of order. The ground has been cleared of wrack and debris, and the boundary walls have been rebuilt, but the tombstones are still in miscellaneous confusion. We believe it is the intention of Mr. Heynes to appeal for a fund to enable the final work to be put in hand. This burial ground was given by Nelson about a century ago.

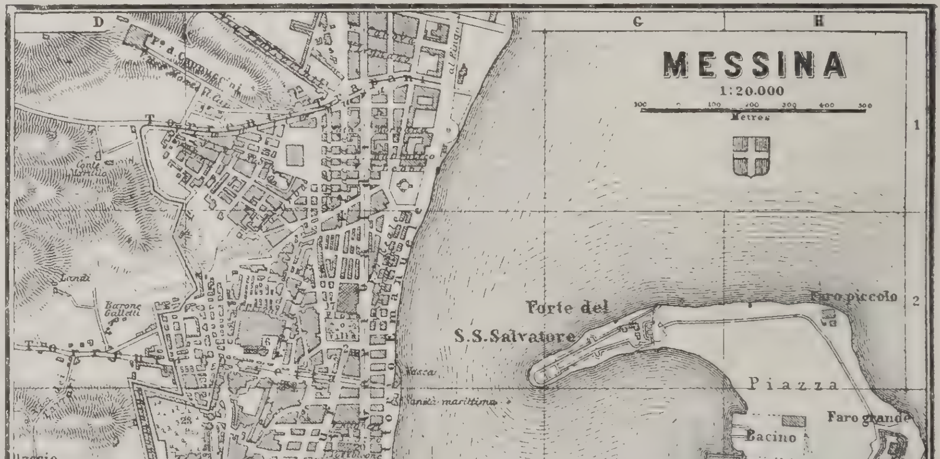
(*To be continued.*)

Proposed New Works.

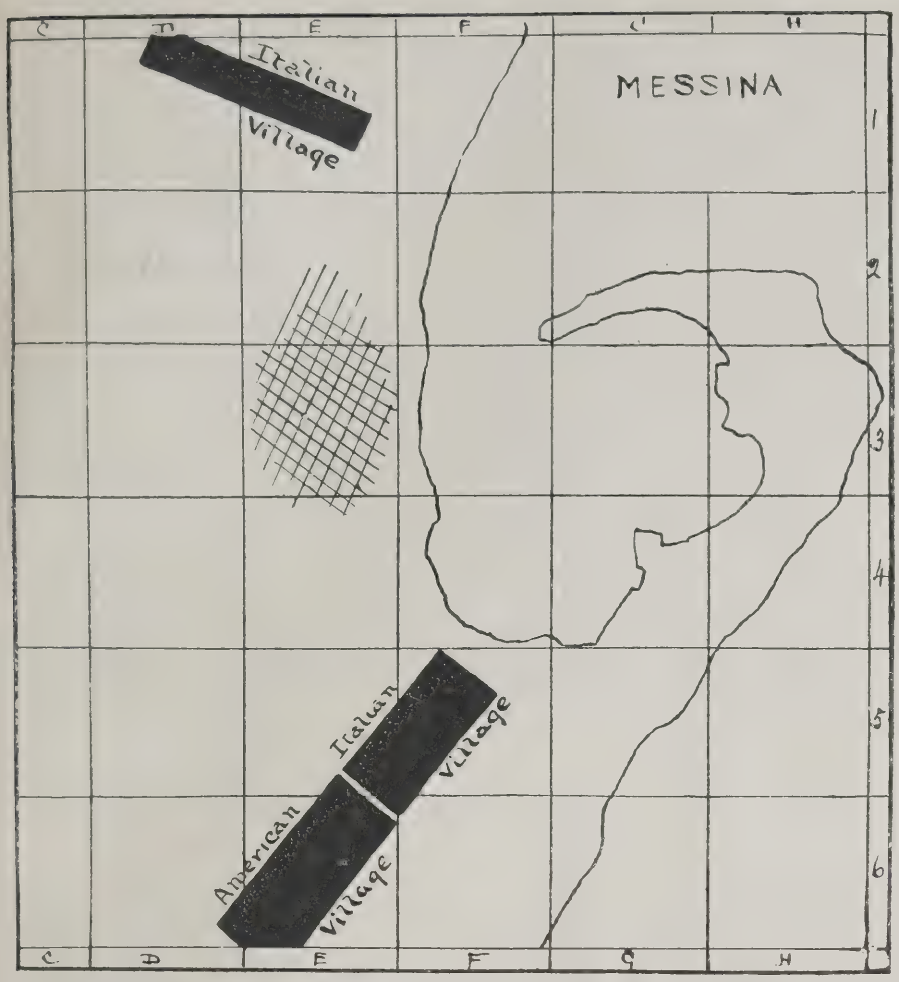
ADLINGTON, NEAR CHORLEY.—A new council school to accommodate 600 scholars and to cost £4,388, is to be built here.

ARBROATH.—In consequence of the inadequacy of the present accommodation for the supplementary classes and the desirability of providing for the special requirements of the evening continuation classes, it is proposed to erect a new school at an estimated cost of £6,000.

ASHTON.—At a meeting of the Elementary Education District Committee it was reported that notice had been received from the Manchester Education Committee, of a proposal to erect a new public elementary school for the accommodation of about 1,000 children, at Moston. Correspondence was presented in reference to the site for a new school at Duke Street, Denton, and also with respect to the negotiations for the purchase



MAP OF MESSINA.



MESSINA; DIAGRAM MAP TO BE COMPARED WITH THAT OPPOSITE.

of land at Droylsden, forming part of the Moravian Estate, as the site for a new school and a public recreation ground. It was decided, in view of the fact that the managers of the Denton and Haughton School have recently incurred considerable expense in improvements, and that a new Council School, which may materially affect the number of children attending, is to be erected, to recommend the Education Committee not to press for further structural alteration at present.

BARNSLEY.—The Church Council connected with St. Mary's, Barnsley, have decided to build a boys' new school at a cost of £4,000. The school has been subject to report by H.M. Inspectors, and the present scheme involves the liquidation of the debt upon the Churchfield site and the utilisation of the present buildings for girls and infants.

BLACKBURN.—A scheme for the provision of a new sanatorium for male consumptives has been approved by the Guardians of the Blackburn Union. It has been decided to convert an old building in the Workhouse district, formerly used as a small-pox hospital, for this purpose.

CHELTENHAM.—A building scheme of some magnitude is projected, involving the development of a large area at Leckington Hill. Plans have been prepared by Messrs. Prothero, Phillott and Barnard, of Cheltenham.

DERBY.—The plans of the proposed new Hippodrome to be erected at the corner of Green Lane and Macklin Street, have again been rejected on the ground that they did not comply with the borough by-laws. Since the plans were previously before the committee numerous modifications have been made, but they still fail to satisfy requirements, the particular by-law under which they have been ruled out being that "without the approval of the Corporation" the height of a building shall not exceed the width of the street it adjoins. The promoters are determined to proceed with the work, recognising, of course, that they will first have still further to revise their plans.

EASINGWOLD.—The North Riding Education Committee have addressed a letter to the Council, advising them that the preliminary arrangements for the provision of a county secondary school and pupil teachers' centre, were being made, and mentioning a number of parishes which the school is to serve.

HUDDERSFIELD.—At a meeting of the Council of the Huddersfield Chamber of Commerce it was stated that the Postmaster-General had written, saying the suggestion that the present Post Office in Northumberland Street should be utilised by various Government departments, and a new Post Office erected on the vacant plot of land opposite, had been considered, but he regretted that it could not be adopted.

IRVINE.—The Dean of Guild Court has passed linings of a new post office for Irvine to be erected by Mr. Gavin Ferguson at 157, High Street, Irvine, on the site of the present Montgomerie Estate Office. The building is estimated to cost about £1,500, and is to be opened at Whitsun.

MEXBOROUGH.—The West Riding Education Authority have intimated that they intend to proceed with the building of the proposed new additional elementary school at Mexborough. The Town Council, however, have decided to recommend to the West Riding Authority that the scheme be delayed for twelve months.

NEWCASTLE.—The probable cost of a new parish hall, which it is proposed to erect here, is £2,000. The Parochial Committees recently met, and approved the plans which have been prepared by Mr. A. B. Plummer, the diocesan architect. The buildings are to be erected on the site to the east of the church.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea. Deposit returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Oct. 31.	PEMBROKESHIRE SMALL HOLDINGS: Model plan and specification for a farmhouse and outbuildings suitable for a holding of 50 acres, and at a cost of £400 or thereabouts. The following are some of the conditions: (1) The selection of the plan and specification to be adopted shall rest solely with the Council. (2) The Council will be prepared to pay a sum of £5 5s. for the selected plan and specification, which are then to become the absolute property of the Council. (3) If the Council are of opinion that none of the plans are suitable for their purpose they shall not be obliged to make any selection. Plans and specifications to Marshall George, Clerk and Agent, Pembrokeshire Small Holdings and Allotments Committee, Haverfordwest.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30, and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: one guinea.
Dec. 18	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly. Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Jan. 31, 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle. Director of the Museums. City Hall, Cardiff.

Hamilton New Academy.

The competition for the above has resulted in the selection by the assessor of the plans of Messrs. Cullen, Lochhead and Brown, of Hamilton and Motherwell. The building will cost £35,000.

MESSINA: THE NEW TOWN—ITALIAN QUARTER.

Warrington Elementary School.

We are officially informed that the Competitions Committee of the Royal Institute of British Architects are corresponding with the Warrington authorities with a view to the amendment of the conditions in this competition.

New Council School, Walton-on-Naze.

In the recent competition for designs for this school, the plans submitted by Messrs. Tomkins, Homer and Ley, of Frinton-on-Sea, and 54 and 55, Bishopsgate Street Without, E.C., have been awarded first place, and selected for adoption by the Essex Education Committee. The building will consist of a mixed school to accommodate 352 scholars, with a cookery centre attached.

Whitby Secondary School.

In this competition the assessor selected the design numbered 41, and awarded the premium of 20 guineas to the design numbered 112, and the premiums of 10 guineas to the design number 66. The names of the architects are as follows:—41, Messrs. Thomson and Bristow, 13, Westminster Chambers, Victoria Street, S.W.; 112, Mr. R. W. Owen, 60, Castle Street, Liverpool; 66, Messrs. Oliver, Leeson and Wood, Milburn House, Newcastle-upon-Tyne.

Deptford Branch Library.

Mr. J. S. Gibson has given his award in the above competition. The first place has been awarded to Messrs. Castle and Warren, of Talbot House, Arundel Street, Strand; the second place has been awarded to Messrs. W. F. Young and H. W. Horsley, Norfolk Street, Strand; and the third place to Messrs. Wills and Anderson, Bloomsbury Square.

The Corporation of Glasgow are preparing to celebrate the jubilee of the completion of the scheme for supplying the city with water from Loch Katrine. This great undertaking, which was the pioneer attempt to turn to domestic and commercial use a lakeland 40 miles from the centre of distribution, was opened by Queen Victoria on October 14th, 1859. During the 50 years Loch Katrine works have needed no alterations or improvements of any importance, and they stand today as a monument to the genius of their designer, the late Mr. J. F. Bateman, who, at a banquet in 1860, claimed that they surpassed the greatest of the nine famous aqueducts which fed the city of Rome. The almost limitless resources of the supply will be appreciated when it is stated that the quantity of water drawn from Loch Katrine daily would fill a canal of 30ft. wide and 6ft. deep for 19 miles.

Law Case.

Weights of Brushes: Important Test Case.

In the Birmingham Police Court, a brush manufacturer was summoned at the instance of Thomas Marson Till, 8, Old Jewry, London, secretary of the British Brush Manufacturers' Association, on the charge of having sold brushes that were marked "9ozs.," but were alleged to contain a smaller weight of bristles. The summons was taken out under section 2, paragraph D, of the Merchandise Marks Act. The defendant did not contest the accuracy of the statement that certain brushes particularised by the prosecuting counsel were slightly under weight, but counsel for the defence produced several specimens, all under weight, of brushes made by other manufacturers. "It is," said counsel for the defence, "a common experience in the trade that a nine-ounce brush does not contain nine ounces. The Association want to stop it. This is merely a test case. It is the first case of the kind in this particular trade; and as the defendant has done no more than his fellow-manufacturers have done, I submit that it is a technical offence, and should be dealt with accordingly. I should like to say that we gave the prosecution every possible assistance. I will ask the Bench to bear in mind that the case is simply brought into court with the object of warning the trade that such a custom is not legal, and is not in the best interests of the trade." Counsel for the prosecution demurred to the implication that short weight was a custom of the trade.—The Chairman of the magistrates said: "As this is the first case of the kind brought before the Court, I think that justice will be met by inflicting a small fine of £1, and three guineas costs." Other summonses were withdrawn.

SCHOOL OF ART WOOD-CARVING.

The School of Art Wood-carving, 39, Thurloe Place, South Kensington, has been re-opened after the usual summer vacation, and we are requested to state that some of the free studentships in the evening classes maintained by means of funds granted to the school by the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships, and any further particulars relating to the school, may be obtained from the manager.

THE ESSENTIAL UNITY OF BUILDERS' INTERESTS.

(*Contributed.*)

In Hobson's "Industrial System" in a chapter on "Trades, their place in the Industrial System," occurs the following passage:—

> "The relations between trades are seen on analysis to be vastly complex, and one feels constrained to figure industry as a live organism with something like a common flow of blood and a common system of nerves and an organic co-ordination of parts resting on a complexity of business cells, the whole set of industrial operations being so closely bound together that any touch bestowed at any point may be communicated to the most distant parts."

How true that sounds; and dealing as we do in this Journal with the many phases of one of the largest and most complex of our great industries, it is often borne in upon us how difficult it is to assign to each event its relative importance, to the individual trade or profession concerned and to the industry as a whole. No doubt our readers, especially those who belong to highly specialised branch trades, and perhaps some of those whose interests are of a purely professional kind, find the same difficulty when they come across a series of articles on some special subject such as reinforced-concrete, and failing to fully apprehend the consequences of the introduction of reinforced-concrete construction into our industrial system, and not being directly interested in that kind of construction, feel bored by what seems to them a series of dry technical studies, interesting only to a few specialists who design and erect buildings in that material.

Let them, however, consider the matter in the light of the quotation with which we began this article, and, if possible, go over a few reinforced-concrete buildings, and then try to realise the enormous revolution which is being thus introduced into the building industry, and we shall be surprised if they feel any longer bored.

From the professional side the introduction of ferro-concrete has brought in its train the need for a fresh study of many problems of construction which have been solved hitherto on time honoured lines; fresh calculations, fresh tests, fresh specifications, fresh computations for measurement, fresh methods of applying a satisfactory finish to the surfaces of the huge grey boxlike structure which emerges from the hands of the constructor in reinforced-concrete.

There is no end of fresh points to be studied and thought about and talked over by engineers, architects, surveyors, and their respective staffs, but to do this intelligently they must first study and understand the materials and methods of construction involved in reinforced-concrete, constantly revising and re-adapting their previous knowledge during the process.

From the industrial side the most vital problems are raised by such huge reinforced-concrete buildings as the Post Office extension at St. Martins-le-Grand (and other similar constructions which are springing up in various parts of the country). Here is a huge construction put up and roofed in without the use of common brick, or ashlar stone, or terra cotta for the building of its walls, or of tiles, slates, or sheetlead, or copper, or timber for its roof. Is there nothing for the brick and tile works and workers, the slate and stone quarries and masons, the timber importers and carpenters, the lead merchant, and the pumber to think about in all this?

There is a remarkable development of centering required to carry out reinforced-concrete work with no end of problems to solve, so that the maximum of efficiency, mobility, and economy may be realised. Is there nothing in this to interest the joinering branch?

Reinforced-concrete buildings require finishing externally and internally with some kind of familiar looking material. Here are endless opportunities for the brick and tilemaker, the plasterer, and the marble, granite, and stone quarries to adapt their materials to facing

MESSINA: ONE OF THE TWO HOUSES WHICH SUCCESSFULY WITHSTOOD THE SHOCK.

NOTE.—The condition of the house as shown in this view must be attributed to the camera and not to the earthquake.—EDITOR.

purposes, and to devise improved methods of fixing and securing. Can this be done without studying the conditions of reinforced-concrete construction?

The walls, roofs, floors, cornices, staircases, parapets, and vaults of building are now being done in the new material, and there is every probability that fireproof doors, window frames, mantelpieces, drains, water-tanks, gutters, and down-spouts, and all kinds of run-ways for pipes for water and electric and heating services will be eventually so constructed. What are the various sub-trades going to do about it? Are they going to devise specialities in the new materials to meet the demand, or are they going to allow themselves to be ousted?

Up to the present it only pays to adopt reinforced concrete construction in large buildings of certain types, but how long will that restriction last? If we consider the long rows of identically planned two-storey houses with which the speculative builder delights to cover the land, it is evident that there is an opportunity for the application of the new method to this class of building also. Mr. Edison, at all events, thinks so, since he is devising forms for pouring complete houses into metal moulds. In short, the advent of reinforced-concrete construction is the

Most Revolutionary thing which has happened in Building within living memory

and its coming will upset all existing values and demand endless re-adjustments from the professional side, the industrial side, and the artisan side before a stable condition can be reached. Doubtless, a similar line of investigation would show that every change in constructional methods will have some bearing on the practice of some or all the constituent trades of this industry, and therefore needs scrutinising, and its effect gauging by each one engaged therein. In fact, it should be frankly agreed that

The Building Trade is one industry,

not a series of separate and independent trades occasionally brought together; anything, therefore, affecting constructional engineers, architects, and quantity surveyors will sooner or later affect the general contractor, and what affects the latter will eventually affect the sub-contracting trades, and vice versa. Questions of this kind are constantly being reported on and referred to in our columns, as, for recent example, the question of "Builders' Locked-up Capital," the question of "Engineers and Architects as sole Arbitrator under a Contract," for which they are also acting in their professional capacity, the question of "Tenders being invited by building owners without quantities being supplied by a competent surveyor." By every one of these questions the professional side, the industrial side, and the subcontracting side of the industry is more or less strongly affected.

If we turn to legislative matters

the same thing applies. Whether the questions under consideration are a Housing and Town Planning Bill, a Building and Engineering Works Bill, a Trade Boards Bill, a Labour Exchanges Bill, or an Insurance against Unemployment Bill, every branch of the industry ought to be keenly interested because every branch will be more or less affected by such legislation.

Just as one cannot drop a stone into a pool without producing ripples which, traversing its surface in every direction, rebound in reversed wavelets from the circumscribing shores, so one cannot interfere with any part of a great modern industry without setting in motion waves of transmitted effects, whose extent and results can only be foreseen and guarded against by those professional and trade organisations which have realised the essential unity of the interests of every member of the industry, be he in a large or in a small way of business, be he engineer, architect, surveyor, general contractor, or sub-contractor, and are prepared by cooperation for common objects, and mutual concession in regard to separate objects to promote the general welfare of the whole.

[It is the aim and object of this Journal to inform, aid, guard, and promote the best interests alike of the whole and of the parts of the building industry, by giving accurate information on all new developments, by calling attention to abuses and suggesting remedies, and by voicing the opinion and wishes of its various parts; and in doing so it is entirely animated and guided by that general conception of the essential unity of the industry to which reference has been made. —EDITOR.]

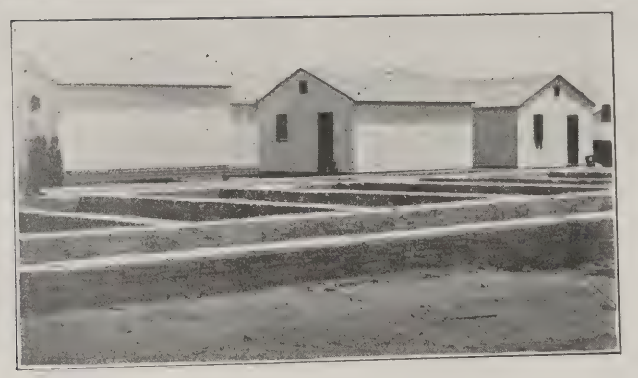
Works in Progress and Completed.

BRADFORD.—The opening ceremony in connection with Bradford Town Hall extension, which has been carried out at a cost of £85,000, took place recently.

LONDON, S.W.—The new extension to the L.C.C. School of Building, Ferndale Road, Clapham, has just been opened. The hall is capable of seating 3,000 people.

MAIDENHEAD. — The new secondary school for boys at Maidenhead for the Berkshire County Council, is now nearing completion, the buildings being completely roofed in. The school is designed on the corridor system, and is from the designs prepared by Mr. A. Jessop Hardwick, F.R.I.B.A., and selected in open competition. A master's house is also being built in connection with the school. The builder is Mr. J. B. Seward, of Wokingham.

MESSINA: THE PRINCIPAL NEW HOTEL.



MESSINA: THE NEW HUTS, SHOWING THE INDEPENDENT BRICK FOUNDATIONS.

NEWBURY.—The new secondary school for girls at Newbury for the Berkshire County Council is progressing rapidly, the steelwork for the fireproof floor now being fixed. The building is estimated to cost £8,728, and is planned on the corridor system, with a large assembly hall on the first floor. The architect is Mr. A. Jessop Hardwick, F.R.I.B.A., and the contractor Mr. J. B. Seward, of Wokingham.

OXFORD.—To meet the increasing needs of accommodation for the parishioners of Summertown, the northern suburb of Oxford, a church called St. Michael and All Angels is being built in Lonsdale Road, which, when completed, will provide sittings for about 1,000 persons at an estimated cost of about £13,000. The portion erected consists of chancel, north and south transepts, lady chapel, and one bay of the nave, affording seats for about 600. The building when finished will be 133ft. in length, and will be the largest parish church in Oxford.

PONTARDULAIS.—The chapel which has just been completed for the Presbyterian sect, was designed by Mr. W. B. Rees, of Cardiff, and has been built by Messrs. A. and A. Thomas of this town.

SOUTH SHIELDS.—The German Sailors' Home, which has just been opened, has been erected at a cost of about £8,000, the general contractors for the work being Messrs. Robert Neill and Sons, of Manchester, and the architects Messrs. Liddle and Browne, of Newcastle.

STOWMARKET.—The new secondary school which has just been opened, has involved an expenditure of about £5,000. The architect is Mr. T. E. Key, of Aldeburgh, and 45, Bloomsbury Square, and the builder Mr. A. Gayford, of Trinity Works, Ipswich.

STARBECK.—The new church of St. Andrew, now in course of erection, is to seat about 600 people. The cost is estimated at £6,000. Messrs. Austin and Paley are the architects.

SUDBURY.—The estimated cost of a new Roman Catholic school which was opened here recently is £860. Accommodation for about fifty scholars is provided in the new building.

TREORCHY.—A new church building, which has just been opened, forms part of a scheme which has been initiated by the Welsh Baptist Church, at an estimated cost of over £6,000. The architect was Mr. T. D. Thomas, of the firm of Messrs. W. D. Morgan, Pentre, and the contractor was Mr. Gwynne Edwards, of Treorchy.

WIMBLEDON.—The new church of St. Andrew, which was recently opened here, is built of red brick with stone facings, and is in Gothic style. The church, which is complete with the exception of the side chapel, provides seating accommodation for 620 people, and has involved a total outlay of £8,026. The architect is Mr. W. T. Lowdell, John Street, Bedford Row.

YARMOUTH.—The new harbour offices which have just been opened are the design of Messrs. Olley and Haward, architects, of Great Yarmouth. The work has been carried out mainly by Messrs. Carter and Wright, of Dene Side, Great Yarmouth.

Our Plate.

Proposed House, Halifax.

This house is proposed to be built of local millstone grit-stone, walled in random courses, and the roofs covered with local "self-faced" stone slates. As far as possible stones having natural red iron-stained faces will be used, with the object of getting as much variation in colour as possible. The windows will be of leaded lights and metal casements. Messrs. Joseph F. Walsh, F.S.I., and Graham Nicholas, F.R.I.B.A., of Halifax, are the architects.

Notes and News.

It was stated the other day that the interior of the chapel at the Fulbourn (Cambs.) Asylum had probably not been redecorated for thirty-five years. The work is now to be done at an estimated cost of £175.

* * *

The Southport Water Board have entrusted the firm of Messrs. Parker and Sharp, contractors, York, with the complete erection of their new Bickerstaffe pumping station, powerhouse, office, cottage, and boundary wall amounting to a little over £17,000. Messrs. H. Rofe and Son, C.E., of Westminster, are the engineers.

* * *

The dispute between the Paris building contractors and the Paris masons over the question of piece work, which resulted in a general strike temporarily paralysing the sequence of the arbitration of the Society of French Architects, who have granted almost all the claims of the men. The masons receive notably an increase of wages. Some 7,000 men, therefore, who had been out on strike for more than a week, have returned to work.

* * *

The Carron Co. have supplied 22 fire grates of special oriental design for the new palace of the Ameer of Afghanistan at Cabul. The grates are adapted for wood fuel.

* * *

The members of the Master Builders' Association at Bloemfontein refused to tender for the new Government offices unless they were supplied with bills of quantities, and were supported in this attitude by the associations in other parts of the country. The Orange River Colony Government has now conceded the request, and it is probable the undertaking will soon be commenced.

* * *

Professor Henry Adams, M.Inst.C.E., M.I.Mech.E., etc., delivers this evening, before the Association of Engineers-in-Charge, at St. Bride's Institute, his presidential address, the subject being "Standardisation."

* * *

The Sheffield Corporation's tunnel through the Bamford hills for bringing water from the Derwent Valley into the city has just been completed. It is 4 1-3 miles long, is the longest tunnel of its kind in the United Kingdom, and has taken over five years to construct. During the progress of the work the tunnel has been ventilated by electric fans, and all the material has been drawn out by electrically hauled trucks.

* * *

The Newbiggin Colliery Co., Ltd., Newbiggin-by-the-Sea, Northumberland, have recently placed an order for a complete plant for the erection of 602 miners' houses, with the (U.K.) Winget Concrete Machine Co., Ltd., Star Buildings, Northumberland Street, Newcastle-on-Tyne.

* * *

The paragraph on p. 274 of last week's issue relating to Messrs. Arthur L. Gibson's announcement of the completion of their new Radnor Works, Strawberry Vale, Twickenham, and that all future orders for Kinnear patent steel rolling shutters will be filled from that address, was in error in stating that correspondence should be sent to the firm's old address. Owing to the rapid development of business, the firm have found it necessary to remove their offices and warehouse to the works at Twickenham, as it became apparent that the concentration of all departments at one address would tend to the more efficient conduct of the business. All communications should therefore be addressed to Radnor Works, Strawberry Vale, Twickenham.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

Cement Grout. Some interesting particulars have lately been given concerning the cement grout used extensively for injection into the masonry of the tunnels on the Metropolitan Railway in Paris. The Seine sand is rather coarse grained, and it was not found possible to make grout with it in the desired proportions of two parts of sand to one of cement, and use it with pumps or the Greathead injector. In fact, the proportions had to be reversed, two parts of cement being used to one of sand before it was possible to use it in this manner. Accordingly Mr. Buignet, one of the assistant engineers, carried out a series of experiments with various sands, finding the fine-grained Clamart sand (specific gravity about 1.14) the most satisfactory. Using this sand, it was possible to get any desired proportion, and a mixture of sifted sand and water could be injected. Experiments were made with a tube formed of planks filled with pebbles and coarse gravel. The Clamart sand grout penetrated and gave perfect cohesion for a distance of 23ft., while the Seine sand grout only penetrated to a depth of 2.3ft. from the opening. In the mixing 132 gallons of water were used per metric ton of the mixtures.

External and Internal Pressure. In the standard notation of the Concrete Institute we can use the following formula for the calculation of the resistance of a pipe to internal pressure. This formula applies to a strip of width b, and conforms generally to the methods adopted by the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects, the regulations of the German Government, and the by-laws of many cities in the United States.

$$A_T = \frac{p\ d\ b}{t}.$$

where A_T = area of steel in tension.
p = unit pressure on sides,
b = width of strip considered,
d = internal diameter,
t = safe unit stress in steel.

If the construction carries water—
p = 0.215 H, where H = head of water in feet.

The area A_T obtained from the formula is distributed in the form of hoops or spirals.

The thickness of the shell is determined by practical considerations; for pipes up to 9ins. diameter it is usually 1½in. to 2ins., and up to 3ins. beyond that diameter. Very often the thickness of large sewers is 6ins. and more, while reservoirs and Silo bins usually taper from 4ins. at the top increasing by 1in. for every 10ft. of depth.

To determine the area of longitudinal bars the portion of the shell between hoopings should be considered as a beam fixed at the ends, the bending moment it has to resist being $M = \frac{1}{12}$ w l., the concrete over the hoopings being in compression at the exterior of the shell and in tension in the interior, whereas the opposite takes place at the centre of the span between hoopings. The latter should be embedded at the centre as shown in Figures 1 and 2. As the shell is curved, 4ins. or 6ins. is a better unit to adopt for the width of the strip, as 12ins. is, as a rule, too great for close calculation.

If A_L = area of longtitudinal reinforcements,

$$r_1 = \frac{A_L}{b\ d_s\ (1-x)} \text{ and } r_2 = \frac{A_L}{b\ x\ d_s},$$

where r_1 and r_2 are the ratios of reinforcement related to the effective thickness of the inside and outside respectively, i.e.—inside and outside longitudinals.

$$\text{Therefore } r_1\ b\ h\ (1-x) = r_2\ b\ x\ h$$
$$\text{or } r_1\ (1-x) = r_2\ x.$$

h is already determined by the thickness having been settled by practical considerations, and $\frac{B}{b}$ is also known, so that from an inspection of $\frac{B}{b}$ diagrams for slabs and rectangular beams, we are able to obtain by trial and error values for r_1, and r_2 to satisfy the above equation and so determine the area of reinforcement for inside or outside, the greater value thus found being adopted.

It is necessary when pipes are moulded singly and are subject to handling, to increase the size of the bars as determined by the forgoing calculations.

When required to resist external pressure the pipe with its reinforcements is treated as a column under compression by the usual method, obtaining W by the formula W = ½ pd., where p = the unit pressure on sides and d = the external diameter. Treating the problem as for columns we have:—

$$c\ [A + (m-1)\ A_c] = \tfrac{1}{2}\ pd.$$

Where C = compressive stress intensity, m = modular ratio of the elastic moduli of steel concrete, A = area of section and Ac is the area of steel.

In this case, however, $r = \frac{A_c}{l\ h}$ or $A_c = r\ l\ d_s$

where A_c is the sectional area of hooping in a length l of the pipe and d_s the thickness of the shell.

A = l d_s, m = 15 and c = 500 therefore we obtain—500 l ds (1 + 14 r) = p.d.

in which only d_s and r are unknown. If either of these is assumed we can obtain the other.

Electrolysis in Reinforced Concrete. With the ever-increasing electrification of tramways and railways, and the tendency to place more and more electric cables of all sorts beneath ground, the phenomena of electrolysis demand the closest attention, not only from engineers, but from builders. For it may affect the sanitary work, the water, drainage, and gas pipes of cast-iron and lead, and so give rise to troubles inside or in the immediate vicinity of foundations. But what concerns us most is its influence on the steadily advancing practice of reinforced concrete construction. Anything likely to militate against this progress deserves earnest study, with a view to devising means of protection. Hitherto observations have been mainly directed to the action of electrolysis on the metal skeleton, and it has been freely argued that if the covering of concrete is good and sufficiently thick, the reinforcement is adequately protected against the attack of possible stray currents from adjacent earthings of rails or out-of-order cables. Recent experiments, however, rudely disturb this comforting view. True enough, good work—that is, well mixed concrete, used with sufficient lavishness and thoroughly tamped, offers a greater resistance to currents of feeble amperage, but after all it merely seems a question of time. Mr. A. S. Langsdorf was recently telling the Engineers' Club of St. Louis about his own and other people's experiments in this matter. Mr. A. A. Knudson embedded two-inch iron pipes for a depth of eight inches in concrete cylinders, formed of a mixture of equal parts Portland cement and sand, closing the bottom of the pipe with a water-tight plug. The protective coat of concrete was about four inches. These cylinders, also duly seasoned, were placed in tanks of pure water, the open ends not been submerged. Then one of the cylinders was subjected to the influence of a constant current of one-tenth ampere from a storage battery kept going continuously for thirty days, the current entering through the pipe and leaving through the concrete. The other cylinder was left undisturbed in its bath. Other experiments were tried with sea-water baths. In all cases it was found that where no electrolytic action took place the concrete protected the pipe, which remained quite bright. But wherever electricity was at work the pipes were attacked. Not only so, however, but it was found that the concrete itself had undergone deterioration. The cylinders were badly cracked, and the cracks lined with rust. Still more ominous, the concrete had become crumbly, disintegrating easily. The cracks were chiefly radial, and it may be, as Mr. Lansdorf suggests, that they were caused by the rust, which, having a less density and greater volume than the concrete or iron, and being loose, gave rise to a movement of expansion, and consequent fracture. This, however, does not account for the softening of the whole mass. In Mr. Lansdorf's own experiments he used twelve specimens, consisting of 1½in. iron pipe, embedded for 9⅜ins. in a 1:3:5 concrete (good cement, fine sand, and crushed limestone), made rather wet and soundly tamped. The protecting coat had a uniform thickness of 2ins. These cylinders were allowed to mature for fifty days, and were then placed in wooden blocks in six-gallon earthenware jars, filled with pure water, 1in. of the cylinders appearing above the water. Eleven of these cylinders were connected in series, and a current of 0.05 ampere passed through them without interruption for seventy days. Each week one cylinder was removed and broken open, and the pipes cleaned and reweighed. It was found that in all cases there was considerable loss, except in the cylinder not subjected to electrical influence. In a second series of experiments, again twelve cylinders were used, but the duration was reduced to 33 days, and the amperage increased to 0.2. Here corrosion was more rapid. Radial cracking was present in all cases, and so, too, was the general softening of the concrete, though in a less marked degree than in Mr. Kundson's experiments. It would appear, therefore, that the electrolytic action affects the concrete itself directly, and usually indirectly, owing to the corrosion of the metal skeleton. But the quality of the concrete evidently has an influence, and it seems quite possible that the admixture of waterproofing material to the concrete for foundations would provide the additional protection required. Or, again, possibly an outside rendering with a hard cement, drying with a glazed surface, as with Parian cement, would give us what we want. At all events, experimentation along these lines should be persevered in.

DIAGRAMS ILLUSTRATING FORMULÆ FOR EXTERNAL AND INTERNAL PRESSURE.

REINFORCED CONCRETE PILES.

(Concluded from page 211, No. 762.)

Figs. 1, 2, and 3, shows examples of Considère piling. These views relate to a reinforced concrete jetty head, in 45ft. of water, at Thames Haven, for the London and Thames Haven Oil Wharves, Ltd. The jetty head is 136ft. long by 32ft. wide, and stands 50ft. from deck to river bed. Fig. 1 shows a group of piles reinforced with the spiralled hooping rods on the Considère system, which were driven in place without any helmet or dolly. These piles formed the basis of main piers or columns which were made by casting concrete in the cylinders dropped over them around the piles, and the other reinforcing rods shown in the view. The final completed structures with the sheeting removed is shown in Fig. 2, and Fig. 3 is another view of the structure. These views show the adaptability of reinforced concrete piles to difficult circumstances, and the manner in which they can be united and strengthened. An interesting fact to record in this connection is that the original structure, which this work replaced, was carried away by the collision of a steamer.

Figs. 4 and 5 show some reinforced concrete piles, used in the United States, of a very simple form, which were put in place by simply churning them down into position by means of a water jet of the form shown in Fig. 6, which directed a stream of water at the foot of the pile. This method seemed to be sufficiently satisfactory, and the piles were put in place, whereas by the method of driving the gravel could hardly be penetrated, it taking about four days to drive one pile in the ordinary manner.

Another interesting application of reinforced concrete is in the protection of existing timber piling, and also for the armouring of timber piles newly driven. Where timber piles have been driven in water infested by the teredo, even when protected by creosote or similar means, they rapidly decay. The means of protection that have been devised consist of cylinders of concrete dropped round these timber piles. One of the most practical forms is "The Ideal," devised by Cooper Poole, engineer of Southampton, in the way illustrated in Figs. 7 and 8. The system is worked by the Cubitt Concrete Construction Company, and will be seen to consist of square slabs with projections, which dovetail one into the other, and are keyed together by means of steel rods dropped through holes in these inter-locking projections. Where the timber piles have been eaten away they are filled up with concrete poured inside these casings of slabs.

Fig. 9 shows another kind of pile, in which complete cylinders in the nature of pipes are dropped over the timber piles. Another form has half-cylinders clamped together. Fig. 10 shows how some timber piles have been protected by concrete, this design being for the pier construction adopted by the City Harbour Commission of San Francisco, California. The piles were driven in clusters of three and sawn off twelve, sixteen, and eighteen feet below the water level. After the piles were driven, wooden stave cylinders of 3in. planks were placed over these and driven 10ft. or 12ft. into the mud. These cylinders were then sealed at the bottom and pumped out, after which a cylinder of 16 gauge expanded metal 6ins. less in diameter was set inside, and the remaining space filled with concrete. The wooden stave sheeting would, of course, be destroyed by the teredo, but the concrete armoured piles render the main structure permanent.

A CONCRETE INDUSTRIAL VILLAGE.

The industrial village of Mineville, on the eastern slope of the Adirondack mountains has come into existence in proximity to the extensive iron ore mines and separating plant of Witherbee, Sherman and Co., in whose employment almost all the inhabitants are engaged. The settlement formerly consisted almost entirely of wooden buildings, as the company owns thousands of acres of timber land near the mines, and lumber was until recently the cheapest of materials. About six years ago Mr. S. Norton, the general manager for the firm, began experimenting with concrete blocks as a substitute for lumber, and so successful were the original experiments that now nearly all the important buildings on the company's property are built of concrete, and about fifty workmen's houses have been built of the same material, while more are in process of construction. Mr. Norton was formerly connected with a cement manufacturing company, and had learned the great advantages of good concrete construction. His faith in the material has been amply justified by the results at Mineville.

One of the factors that led to this extensive use of concrete was the possession by the company of a very superior aggregate in the shape of the "tailings" or residue left

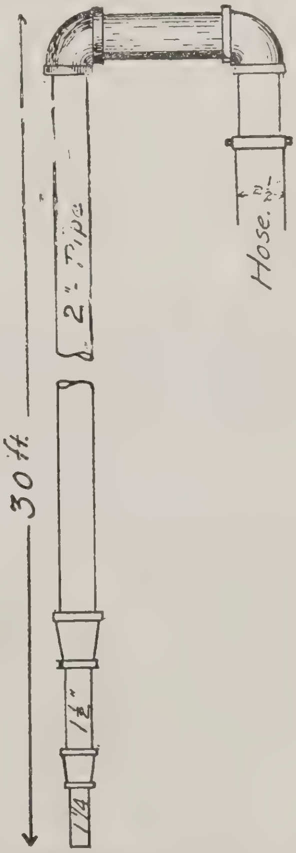

FIG. 6.—ARRANGEMENT OF WATER JET FOR DRIVING PILES.

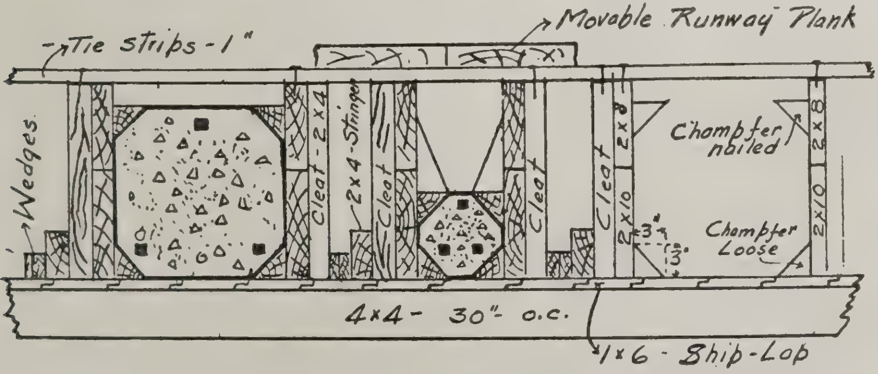

FIG. 4.—REINFORCED CONCRETE PILES DRIVEN BY WATER JET.

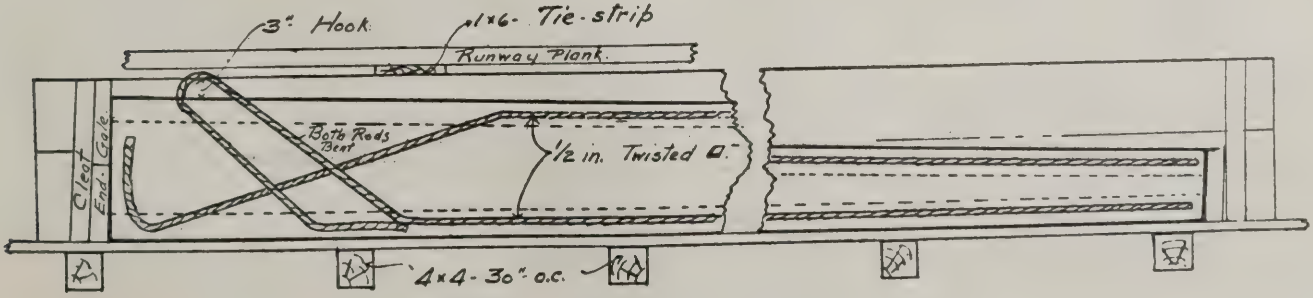

FIG. 5. REINFORCED CONCRETE PILES, DRIVEN BY WATER JET.

after the separation of the ore. An immense heap of these tailings gives a seemingly inexhaustible supply of aggregate, and tests have proved that cement mixed with the run of tailings in the proportion of 1 to 5 produces a very superior concrete block without the addition of sand or gravel. G. B. Dixon, chief chemist of the Glens Falls Portland Cement Co., tested briquettes made of one part "Iron Clad" Portland cement and three parts ore tailings, and found that after 7 days they stood a tensile strain of 341lbs. to the square inch, and after 28 days they withstood 450lbs. to the inch. Briquettes made one part cement and three parts sand showed only about half the above strength. Tests have also been made, using a mixture of 1 of cement, 4.4 tailings and 9.42 broken stone, or 13.82 parts stone and tailings to 1 of cement. With this mixture the following crushing strength per square inch was developed: 30 days 1,010lb., 60 days 1,273lb., 90 days 1,428lb., 120 days 1,378lb., 150 days 1,653lb., 180 days 1,686lb.

The company will build no more permanent structures of wood, and as the existing wooden buildings are replaced from time to time with concrete, Mineville will present the spectacle of a village built entirely of concrete in the midst of thousands of acres of timber land.

The company operates its own plant for manufacturing concrete blocks and cement bricks. Blocks are made from the run of tailings, one part cement to 5 of tailings. Bricks are made 1 to 3, the tailings being screened. Blocks are cured one week before using, being stacked under a shed and moistened by a rotary spray. The capacity of the plant is 300 blocks 8in. × 8in. × 20in. per day with five men.

The first cost of the concrete block workmen's houses built by the company is about the same as with lumber, but with the decreased cost of maintenance they are far cheaper in the end. All block walls are firred with an inch strip of wood lath, and no trouble is experienced from moisture. The houses are warm and comfortable during the severe Adirondack winters, some of the smaller ones being heated only by the family cook-stove. The houses are built to rent on the basis of $1.00 per room per month.

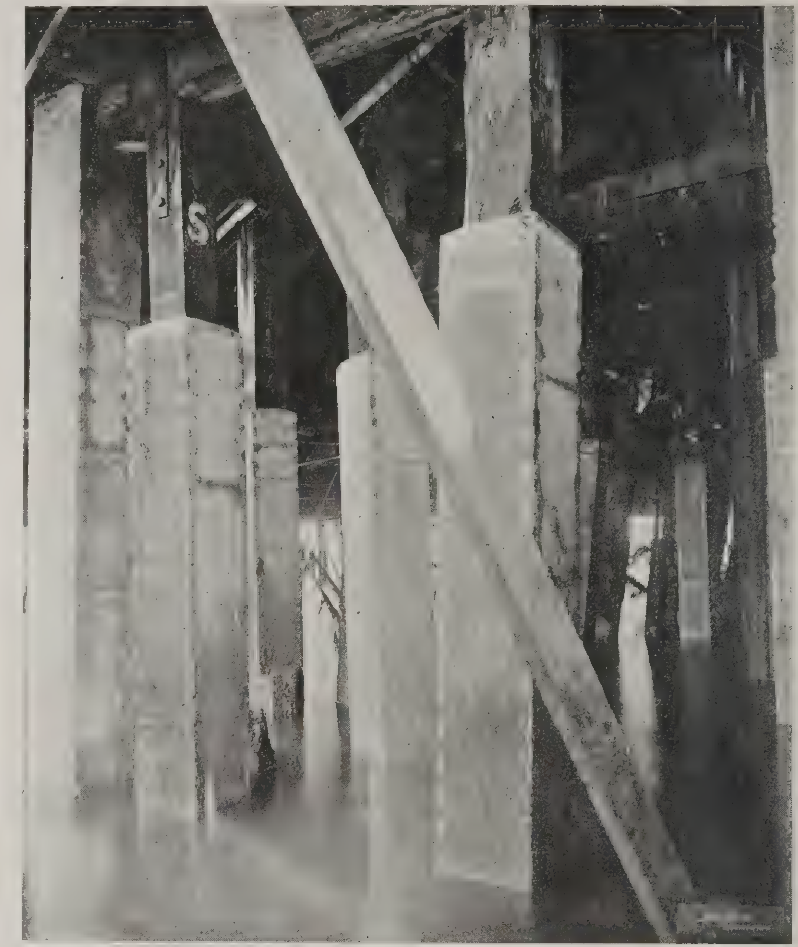

FIG. 8. VIEW OF THE PILES FOR THE ROYAL PIER, SOUTHAMPTON, PROTECTED WITH THE IDEAL SLABS.

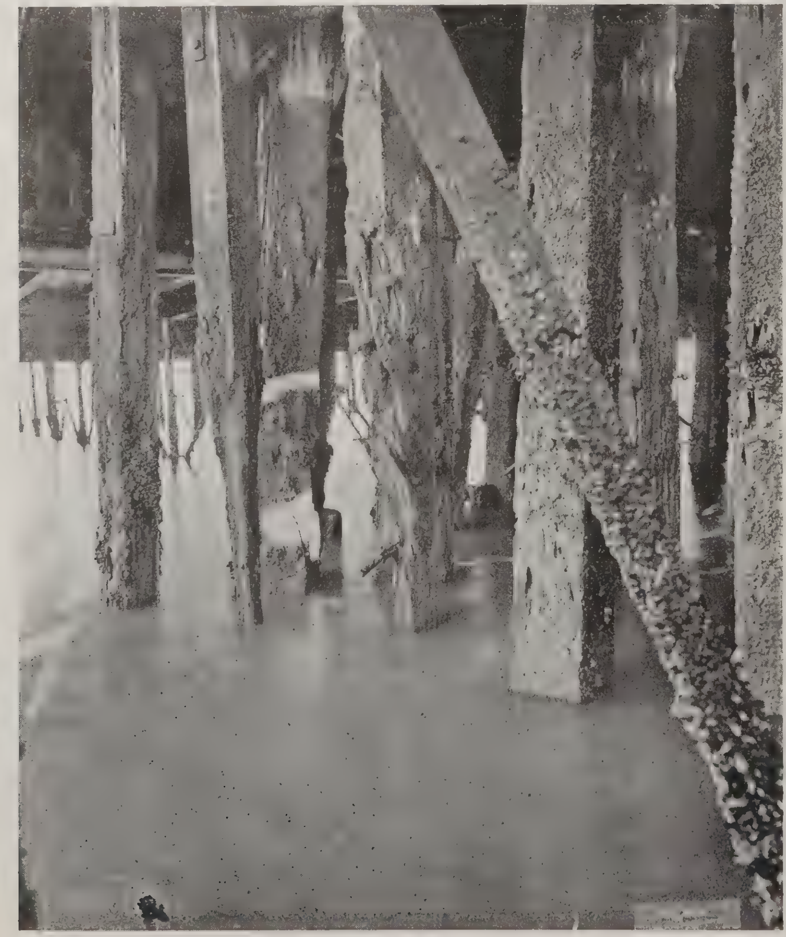

FIG. 7. VIEW OF TIMBER PILES, ROYAL PIER, SOUTHAMPTON, BEFORE BEING REPAIRED.

Around the office building at Mineville the company has built a driveway 600ft. long, 14ft. wide, and 5in. deep, using a mixture of 12½ parts ore tailings to 1 of cement on the average.

ADHESION OF STEEL TO CONCRETE.

Some important tests to determine the adhesion of steel to concrete have been recently carried out at the Vienna Museum of Technology, and the results have now been made public. The tests were made with 8-in. cubes of concrete, in which were embedded round steel rods, about ¾in. in diameter, passing through the centre of each block in the direction in which the materials were stamped in the mould. The concrete was mixed with four different proportions of cement to aggregates, and the rods were drawn six weeks after the blocks were made. The mean adhesive strength in lbs. per sq. inch in the four mixtures was found to be as follows:—(a) 447.9, (b) 600.2, (c) 645.7, and (d) 655.7. The cubes were not injured in any way by the withdrawal of the rods, and no cement remained attached to the rods. The tests showed that a fat concrete did not greatly increase the adhesive strength, as by trebling the amount of cement the increased adhesive strength was under 50 per cent. Similar cubes tested for crushing strength seven months after moulding showed results in lbs. per sq. inch as follows:—(a) 1,052, (b) 1,450, (c) 1,834, (d) 2,176. The (a) mixture was 1 to 12, (b) 1 to 8, (c) 1 to 6, and (d) 1 to 4 in each case.

THEORETICAL AND EXPERIMENTAL RESEARCHES.

(The figures in this article are Italian Weights and measurements. An Italian ton equals 2237·7lbs. English.)

Tests of the Effects of the Shear Stress in Beams of Re-inforced Concrete.

Professor E. Morsch, of the Zurich Polytechnic, has made some very interesting tests on reinforced concrete beams constructed according to designs which he furnished the firm of Messrs. Wyass and Freytag of Neustad; the object of these tests was to establish the truth of the so-called German method of calculation for the shear resistance and for the adhesion between iron and concrete.

The result of these tests was made known at a conference held by Professor Morsch at the Society of Engineers and Architects in Zurich, and we give a summary of these interesting experiments, together with the tabular statement of the results that were recorded.

According to Professor Morsch, the trial beams were to be constructed in such a manner as to immediately exhibit the effect of bending strain. This was obtained by using rather short beams. In order to obtain a convenient system of loading, and at the same time to prevent the development of secondary torsional strains, every piece which was to be tested was constructed as a pair of beams placed side by side united by a large horiontal top flange or table placed across them. The composition of the concrete was the normal one of 1 to 4½—aged at time of testing about three months. The section of steel in the middle was the same in all the beams; the sides were painted in white so as to show up the smallest cracks.

The tests with the 12 beams were divided into 3 groups according to the load; six beams had evenly distributed loads, three had two loads concentrated at third-points of the length and three had the load concentrated in the middle. (Tables 1 to 12.)

The "German method" of calculation supposes that the steel reinforcement of the extended part resists the internal horizontal tensile force without any strain of the concrete. However, as long as the steel adheres to the concrete the difference between the strains must be transmitted by the concrete of the main body to the compressed part. According to this hypothesis, there are constant horizontal and vertical shear strains in the whole height of the beams even to the neutral axis, and these strains produce principal tensile stresses τ_0 of equal intensity and at an angle of 45 degrees. As the resistance of the concrete to tension is less than that to compression and shear, it follows that a body pulled in such a way must crack in a direction normal to the principal stresses. Tests made on cylindrical bodies strained by torsion confirm this deduction, inasmuch as the rupture always follows a diagonal helicoidal surface of 45 degrees. From this it is to be gathered that the steel reinforcements should be placed at a corresponding angle of 45 degrees to these strains. The tests have shown that this method of placing the steel is the safest.

The dimensions of the beams which were tested and their reinforcements and the essential results are summarised in the following table. The cracks which lead to rupture are shown in heavy black lines in the illustrations; cracks occurring during the loading are marked, as also superficial cracks. In the table the tension at failure is recorded in black type.

Beam.	First Tensile Crack.		Commencement of the Diagonal Cracks which lead to Rupture.					Period of Rupture. (The bolder Figures indicate point of Rupture.)				
N,	Load.	σf	Load.	σf	τ_1	τ_0 At the Supports	τ_0 At the end of top the Cracks.	Load.	σc	σf	τ_1	τ_0
	Tons.	kg./cm.^{2}	Tons.	kg./cm.^{2}	kg./cm.^{2}	kg./cm.^{2}	kg./cm.^{2}	Tons.	kg./cm^2	kg./cm^2	kg./cm^2	kg. cm^2

1st Group. Evenly Distributed Loading.

The Beams I., II. and III. are reinforced with straight bars; one half has a row of stirrups, but there are none in the other half. The Beam II. differs from I. by the vertical rib being double the size. Beam IV. differs from Beam I. by the fact that instead of round bars there are mechanical bond bars which are greatly used in America and which many engineers in Italy have recommended. In the bars used in this case, the section of the bar, at the flattened portion, amount to 2.04 cm^2, while the round part had a section of 2.54 cm^2.

In Beams IV., V. and VI., the reinforcing bars were bent up and especially in Beams IV. and VI., near the two ends at an angle of 45 degrees, and in Beam V. at a lesser angle like what is usually done to the steel reinforcement in ordinary reinforced beams. By σf =1,000 an actual load of 11.5 tons is obtained, calculated according to "the German method" in all the beams, with the exception of III. In all the beams, except II., large cracks were found in the middle before the whole of this load was applied. The cracks which were short and small at first, got larger with the increase of the load.

Beam I. Besides the small cracks a diagonal crack, commencing above and extending by degrees to the bent end in the part of the reinforcement not provided with stirrups, became visible when the load was 15 tons. By increasing the load, the crack became horizontal extending over the bar towards the support; at the same time the iron bars bent downwards very much. At 25.7 tons the adhesion between the steel and concrete was completely destroyed at the support, so that the resistance of the steel was not transmitted to the concrete which the bend at the end of the rod is designed to afford. At this point the cracks got larger, the bend at the end curved upwards breaking up the concrete and causing immediate rupture.

Beam II. In this larger beam, the first cracks became visible much sooner than in No. I. At a load of 30 tons, two diagonal cracks were noticed, the left one extending upwards towards the right hand along the top flange, while the other extended downwards towards the left along the bar up to the load of 40 tons. At this load, rupture resulted from the general increase in the size of the cracks and the adhesion of the steel to the concrete having been overcome at the support. These two tests contradict the hypothesis that the diagonal cracks are observed as soon as the resistance of the adhesion between the steel and the concrete is overcome. At the beginning of the cracking, the adhesion required between the steel and concrete was double in the second beam to what it was in the first; instead the values τ_0 7.4 kg/cm2 are corresponding, and hence the shear stress should be taken as the cause of the cracks. The fact that the steel becomes disconnected from the concrete is not the cause but rather the consequence of the diagonal cracks. There are no more oblique tensile forces throughout the cracks and the superficial forces which are at first horizontal become diagonal converging to preserve equilibrium towards a point of the transverse force.

Besides the horizontal forces, there are other vertical components of the stresses above and below the supports. The part of the beam on the left pushes the compressed area of the right portion of the beam upwards and the part of the beam on the right pushes the area of the left part downwards. In the immediate vicinity of the cracks there is, however, a tendency in the right portion to pull away the compressed flange, and in the left part the tendency instead is to pull away the steel of the lower part from the ribs. Thus the horizontal lengthening of the diagonal cracks is observed in the upper part towards the right, and in the lower part towards the left. The greater amount of fracture obtained in No. II. compared with Beam I. is explained by the fact that the crook at the end is secured in a better manner in the wider ribs.

The rupture being always noticed on the portion without stirrups, it follows that these act favourably on the resistance of the system. Above all, these stirrups resist the tensile forces by easing the oblique tension so as to delay the appearance of the diagonal cracks; besides they oppose the separation between the compressed flange and the ribs.

The same effect as is shown by the last test could, however, be gained by bending up the bars forming the principal reinforcement; in this case only an entirely secondary part of the stirrups remains, which is not worth troubling about in calculating the resistance. Such stirrups must always, however, be taken into account in calculating the effective strains in respect to their resisting the tensile forces due to certain secondary external actions; the hypothesis that the stirrups resist the shear forces is inadmissible.

The fact that the diagonal cracks are produced at a certain distance from the support is explained by the second fact that vertical stresses are produced over the supports by compression between the fibres of the beams, which act in easing the principal tensile strains; besides it must be noted that in the vicinity of the supports cracks due to the forces of traction are not formed in the concrete. The consequence of this is that the calculated value of τ_0 is really obtained only in the neutral axis; this is less towards the bottom, and hence the lower parts of the section ease the upper parts.

(To be concluded.)

SMOKE AND REINFORCED CONCRETE.

Considerably more than a year ago, the Austrian Government entrusted Professor J. Klaudy, of Vienna, with the task of determining whether smoke penetrated reinforced concrete structures, and if so, with what result. The inquiry was induced owing to the increased presence of corroding coal smoke in the atmosphere, which is found to be attacking both iron and stone. Professor Klaudy made an exhaustive study of all available buildings, some of which are over twenty years old. He found that smoke does not permeate well-made cement concrete, but that in almost all instances it does manage to make its way into concrete masses by any of the tiniest fissues. A smooth outer coating of fine cement, therefore, seems necessary as a protection. But the matter is not of great importance, for so far as Professor Klaudy's investigations went, it was evident that smoke does not have a destructive effect on either iron or steel, if the reinforcement is properly imbedded in well-made concrete.

THEORETICAL AND EXPERIMENTAL RESEARCHES IN REINFORCED CONCRETE BEAMS. *(See previous page.)*

Views and Reviews.

"Portland Cement."*

We are glad to welcome the second edition of this valuable book, written by Mr. A. C. Davis, F.C.S., who, by-the-way, is Managing Director of the Saxon Portland Cement Company, Ltd, of Cambridge, and some associated undertakings. This fact is worth mentioning because it emphasises the fact that Mr. Davis writes with the fullest qualifications as to practical experience as well as theoretical knowledge of the subject; he writes as a manufacturer as well as a critic, and this book is stamped by professional knowledge not only of the scientific aspect, but also of the commercial aspect of the subject. The book is a most valuable treatise, and all those interested in the subject should undoubtedly possess a copy. The mere enumeration of its contents shows how thoroughly the subject is treated. After an introduction and the definition and description of the invention of Portland Cement, Mr. Davis goes on to write of raw materials, their grinding and mixing, and their estimation and analysis, followed by a chapter on the burning or calcining of the raw materials, then the grinding of the clinker, followed by the chemical testing, sampling, and commercial testing; then he adds information with regard to the fineness and sieving, specific gravity, setting, contraction and expansion, tensile compression and transverse tests, and concludes the volume with three appendices, one containing the British, American, German, and French Standard specifications of Portland cement, the second containing useful tables, metric equivalents, etc., and the third a list of the manufacturers in England and Wales, with their approximate weekly tonnage output in 1907. The last mentioned is perhaps one of the most valuable features of the work. Read in conjunction with a map included in the front of the work showing the location of cement factories in England, Wales and Scotland, it enables the buyer of cement to know where to go for his materials.

The importance of the cement industry is shown by statistics of production. It is estimated that the total quantity of cement produced by the world in each year is from thirteen to fourteen million tons; of this quantity 3½ million tons is produced in Germany, 2½ million tons in England, 600,000 tons in France, nearly 500,000 tons in Russia, 250,000 tons in Belgium, and a total of 400,000 to 500,000 tons in Switzerland, Austria, Sweden and Norway, Roumania, and Italy. The United States produces at least 5 million tons, and Canada 260,000 tons. These statistics, which Mr. Davis gives, are interesting, and show clearly how the United States stands foremost as a producer of Portland cement, while Germany is also a good deal ahead of England. America does not to any great extent compete with us for the export trade, but Germany does, and it is to be hoped that our manufacturers are holding their own; they should be able to do so from what we have seen of their capacity. The modern English manufacturer possesses a good plant as anywhere abroad, and knows as much of the best and cheapest methods of producing cement as anybody, while the natural resources of England for the production of cement are about as good as those of any other country.

In the foregoing statistics we do not know whether the quantity of natural Portland cement produced in Belgium is included, though we presume it is, in which case it is obvious that the great amount of agitation that has taken place in reference to the use of natural cement in this country in substitution for Portland cement has been rather overdone and somewhat magnified the importance of the subject. It is right that the consumer should be put on his guard, but one would think from the excitement that has been caused, there was a very large tonnage of cement exported from Belgium, whereas the total quantity produced seems hardly sufficient to cope with the internal trade alone, if Mr. Davis's figures are correct.

One great feature of Mr. Davis's book is that he does not deal solely with one process of manufacture, but with all. Mr. Davis has had experience as a manufacturer of cement by the wet and dry process, and he can therefore speak without really being biassed in any one direction. The fact that he has had this experience means that we must regard his critical remarks upon the various methods with great attention, and give them great weight. He is quite rightly entitled to have his preferences. A good cement can be manufactured by any of the processes, and doubtless the cost of production is dependent upon many factors, so that we cannot draw any hard and fast line as to which is the most economical method, that depending upon the locality and the nature and quality of raw material available and cost of working same.

The rotatory kiln has been introduced into this country chiefly because of its perfection and success in the United States. It is claimed by one school of manufacturers as the best, but from Mr. Davis's very clear summary of the various processes and means of manufacture it appears that the Schneider continuous kiln offers a means of manufacturing cement as uniform and reliable as that produced by the continuous rotatory kiln process, and in many cases seems to offer advantages on the score of cheapness of production, which may possibly account for the low prices at which cement can be obtained from manufacturers who have adopted this process of manufacture, though here again we ought not to come to any final conclusion, for the financial position of the manufacturers —their capital and plant, and the deposits for raw material available—so greatly affect the situation. The rotatory kiln, when properly worked, seems to produce a cement of remarkably fine quality; indeed, the very best cement that has been produced up to the present, and that gives the highest results, is obtained from the rotatory kilns. Yet it is claimed that with the Schneider process as good cement can be obtained with the fixed kiln. To the user, then, it is solely a question of price.

Mr. Davis describes in detail the process of manufacture by the rotatory kiln, and by the fixed kiln, and generally gives a short history of the stages through which the different methods and appliances of manufacture have passed since their inception. His description of the methods of testing Portland cement is very detailed and very well done. We regret that for so many years cement manufacturers and engineers should have placed so much importance upon tensile tests on cement. Really, it is very seldom that we ever require cement to develop tensile resistance; we use it almost exclusively to develop compressive strength, and cement manufacturers should have long ago improved their manufacture by the study of compression tests. We have heard many statements which we believe to be correct, that cement can be manufactured having a high tensile resistance, and yet giving very poor crushing strength. Such cement is very much inferior to other cements which, while they exhibit a very high crushing resistance, do not show up so well in the standard tests. If, however, cement has a high crushing resistance and just passes the other tests for soundness, in practice it will prove to be thoroughly satisfactory. We require cement to give us very great crushing strength; we do not want it to expand nor do we want it to contract to any considerable extent, and we want it to remain sound. That is the sum total of our practical requirements. Some cements badly manufactured show considerable expansion, and occasionally work that has stood well has suddenly began to disintegrate after about two or three years. The cement manufacturer of to-day is able generally to overcome such obstacles and to produce a very uniform and excellent product, but he does not always give sufficient attention to the development of high compressive strength. Mr. Davis, while he deals extensively with tensile testing machines, does not deal at all adequately with compression tests. It should be noted that the proper form for a test piece is not a cube, but a parallelopiped whose height is one-and-a-half times the length of the side. This allows the material to shear normally.

Reference is made to transverse tests, and the formula for the modulus of rupture usually included in text books is adopted. As a matter of fact, this formula is incorrect, as the results of tests show, and though transverse tests may be valuable taken in conjunction with others, for comparison one with another they are of very little value until we have determined the true relations of internal stresses in materials, and the relation of compressive, tensile and shear stresses of cement and concrete.

It is all very well to test cement in compression and tension, but the best and most reliable tests are those on sand and cement cubes and briquettes; in fact, we would discard the neat cement tests altogether except for soundness. Then, again, in determining the value of cement we believe that tests ought to be conducted on blocks of concrete made with various standard aggregate, and not merely with Leighton Buzzard sand.

We suggest to Mr. Davis that in future editions a valuable feature of the work would be a collection of memoranda regarding the practical uses of cement, as, for instance, tables showing the weight of cement per cube foot, having the different finenesses of grinding under the general conditions of manufacture to-day, and the best figure to adopt as regards commercial cement; the quantities of mortar in various proportions that different quantities of cement will make; these proportions being reckoned by weight and by measure, also practical memoranda regarding the quantities of concrete when rammed in place, which result from various proportions and quantities of aggregate, sand and cement, etc., etc. Such information would be extremely valuable to the practical user of cement, but unfortunately nearly all the text books do not provide sufficient information on the subject, and no reliable data are obtainable. However, Mr. Davis has given a large amount of his store of knowledge in this book, which is bulky. We only hope that, in future editions, he will help us with still more information. The book, notwithstanding its size, gives evidence of having been greatly abbreviated; and much more detail would be welcomed by the reader The book would serve as the basis for a monumental work.

Considering the manner in which Portland cement is increasing in importance in the building and engineering trades during the last decade, this book should find a wide circle of readers. Reinforced concrete is a new phase of the subject, and it is a method of construction which is increasing by leaps and bounds, so that more and more attention is being attracted to the subject of Portland cement; therefore, a book like this, written by an acknowledged expert and manufacturer, who understands the commercial necessitities of the practical side of the subject, is most valuable.

"Reinforced Concrete in Europe."

The author of this book, Mr. A. L. Colby, was sent to Europe in 1908 by several of the largest American steel manufacturers to investigate and report upon the applications of reinforced concrete in Europe. Reinforced concrete has made tremendous strides in the United States, and no doubt the subject has attracted the close interest of the steel manufacturers of that country, and we can well understand the importance they attach to a thorough investigation of the conditions appertaining to the applications of this new method of construction in its original home —Europe. The report that Mr. Colby submitted to these prominent American Institutes has now been printed in book form, and it forms a very valuable précis on the subject.

Mr. Colby's report is very fairly written, and it may be described as a triumph for

PROPOSED HOUSE, HALIFAX. JOSEPH F. WALSH AND GRAHAM NICHOLAS, ARCHITECTS.
(*See Centre Plate.*)

reinforced concrete because, when we heard of his quest we were inclined to think that, perhaps, the endeavour of the American steel firms was to work up a case against reinforced concrete. There have been many failures in the United States due to bad workmanship, but so have there also been failures in steel; the steel firms can no more point to reinforced concrete being more dangerous than steel-work than *vice versa*. Their position as advocates of steel construction versus reinforced concrete can be met with the reply that steelwork, *per se*, did not prevent the gigantic disaster to the Quebec Bridge, nor did it render the Blackwall Island Bridge secure as at first designed and constructed.

However, whatever may have been the intentions of those who sent Mr. Colby to Europe to investigate, he has dealt with the matter fairly, and he finds remarkable little evidence of failures in reinforced concrete construction, and his report practically advertises the efficiency of reinforced concrete and is a great point in its favour. He found that not only was reinforced concrete a thoroughly satisfactory form of building as regards endurance, but he found, too, that there was no doubt as to the economy of reinforced concrete construction, even over steelwork. He states that the saving was admitted on all hands to be phenomenal, and that as to actual percentage savings, statements varied from 10 to 30 per cent., and in one case 50 per cent. One instance was cited of a warehouse which had been entirely constructed in reinforced concrete at a cost of not more than that of the steel alone which would have been required if erected as a steel structure.

Among other points affecting its economy, other than the saving in first cost, Mr. Colby refers to the following:—

1. Superior fire-resisting qualities.
2. Greater rapidity of construction.
3. Increase of floor space.
4. Decrease in cost of maintenance.
5. Monolithic nature and freedom from shock and vibration.
6. Decreased rate of insurance.

The report abbreviates the opinions of authorities and official publication in respect to reinforced concrete that have appeared for many years past, and it forms a most valuable summary of all the regulations in various countries, reports of commissions, etc., such as that of the Committee of the Royal Institute of British Architects.

Mr. Colby says that though failures have occurred on the Continent, these have been due to the use of unsuitable materials and ignorant or dishonest workmanship, and are less frequent than in America for the reason he gives, that the Government rules and the City Building By-laws governing the principles of designs in the erection of buildings, bridges, etc., are rigidly enforced, and thus prevent the erection of reinforced concrete structures by incompetent and unscrupulous contractors, such as those whose work has caused the collapse of a number of buildings in the United States. He says that this is particularly true in Prussia, Austria-Hungary, and France, and in Great Britain, he says that failures are much less frequent than five or more years ago, because this form of construction is now mainly entrusted to reliable firms. Mr. Colby states that after investigating all the failures abroad of which he could find any record, he was led to the conclusion that (1) the number of failures abroad have been very few in comparison with the multitude and variety of structures erected since 1870; (2) that the failures almost invariably occur during construction; (3) that no accident or failure has been traced to any lack of durability or inherent weakness in reinforced concrete construction. On the contrary, it has been definitely proved that the strength of concrete increases with age up to three years at least; (4) defective designs have caused a number of failures abroad, the usual errors being insufficient provision against shearing and insufficient dimensions in the design. But he adds, ignorance of the theories and principles involved is not an argument against this latest form of construction; (5) the use of unsuitable materials has been the cause of some failures. Cement and the aggregates should, therefore, be of good and uniform quality. The only failures traced to the metal reinforcement were cases of careless welding at critical points. Inadequate centering and inferior quality timbering have also been responsible for failures, and the use of sea-water; (6) careless or inexperienced workmanship has resulted in some early failures; (7) failures have occurred by over--training and weakening by applying the test load before the concrete has had time to thoroughly harden, or by the early use of a floor, for instance, up to the maximum load for which it has been designed; (8) a valuable property of reinforced concrete construction is that a finished properly designed structure gives ample warning before giving way.

Far from thinking that the rivalry and commercial competition of specialist contractors might result possibly in undue cutting of the design and the taking of risks, Mr. Colby uses their institution in Europe as an argument in favour of sperior workmanship, his contention being that competition results in them giving careful attention to materials and workmanship, while the former practice of obtaining the designs from some specialist of high standing and then assigning the work to the lowest bidder in open competition is eliminated. This is an argument that we have constantly used ourselves, and we are glad to see it backed by the opinion of a consulting engineer, who represents, if anything, those who are inclined to be opposed to reinforced concrete. The latter system of construction is one that requires considerable knowledge, care, and organisation, and we do not believe it will be an advantage, either on the score of economy or as regards efficiency, for reinforced concrete to be designed by the engineering and architectural professions generally. Such designs should be in the hands of specialists, and we believe that they always will be, because the intricacies of reinforced concrete design are so considerable that the ordinary general practitioner cannot possibly hope to master them. There is every tendency in the direction of specialisation in this modern age, and it is unlikely that the specialists will be reduced in the future. Specialist firms however they may be railed against by a few professional men who are endeavouring to advertise themselves and seeking their own interests, deserve great praise for their enterprise, and the care and attention they have bestowed upon the development of reinforced concrete in the past. Far from wishing to see the present methods of contracting for reinforced concrete greatly altered and done away with, we believe it to be to the best interests of the public, and the architectural and engineering profession, for this system of entrusting work to specialist contractors to continue. We believe that only in that direction lies safety and economy.

The book contains a very complete list of all the special systems upon the market in each of the different countries, with a short description of each, also list of the special kinds of reinforcements, summaries of Government regulations in each country, specifications for materials, list of foreign Government and private testing stations, technical institutions, etc., and a bibliography of reinforced concrete and cement. The list of applications of reinforced concrete contained in the front of the book is very considerable and very striking. It appears to have been put to 88 separate purposes, and no doubt it would be possible to extend the list.

The only criticism we have to offer upon the book is that in some cases the quotations from various sources are not quite correct, the punctuation being such as to somewhat alter the sense, while the translations from other languages into English are often in error, so as to make the paragraphs read entirely opposite to the sense of the original. But these errors will be obvious to the expert, therefore are not so very important.

We note that the number of foreign systems is 144, and we are surprised to see that there are 22 systems of English origin, and 13 other systems of foreign origin in use in England. Of the 22 English systems, six use special forms of bar for reinforcement, the other sixteen use rounds, squares, flat and standard structural shapes, while two of the 16 use a patented stirrup or clip. Among the systems in use on the Continent there are 54 systems of German origin, 21 of French origin, six from Austria, and six from Italy. There are thus quite a multitude of systems, and in reading through the list one is drawn forcibly to the fact that the majority of the systems are very much alike, and that the ordinary system is not so much a novel method of doing the work, but the particular collection of methods and manner of working adopted by each specialist. There are thus as many "systems" as there are specialists.

"Reinforced Concrete in Europe," by Albert Ladd Colby, M.Am.Soc.C.E., M.Am.Soc.M.E., etc. United States: The Chemical Publishing Co., Easton, Pa. London: Williams and Norgate, 14, Henrietta Street, Covent Garden, W.C. Price $3·50.

Federation News.

Northern Counties Federation.

A quarterly meeting of the Board of Representatives of the Northern Counties Federation was held at the Queen's Hotel, Stockton-on-Tees, on Thursday, September 23, Mr. J. Davison presiding, when 36 representatives were present.

The minutes of the quarterly meeting of the Board held at South Shields on Thursday, July 8th, were signed by the president as correct.

The secretary gave a report upon the agreement for working rules with the N.A.O.P., which had now been signed by all parties.

The recommendations passed by the Executive Council with respect to the invitation to be extended to the National Federation to visit the Northern Counties in the summer of 1911 were considered, and it was resolved unanimously to adopt the recommendations.

The Executive Council's report upon the question of the uniformity of working hours on Teesside was received. That Association further reported that their negotiations with the operatives have proved fruitless owing to their refusing to increase the Hartlepool labourers' wage by ¼d. The amount proposed to be given to Middlesbrough and Stockton was at present ¼d. below Hartlepool rate. Formal notice according to rule had subsequently been given the operatives for alteration to the working rules, and notice of ¼d. per hour reduction of Hartlepool labourers, so as to place them on the same rate as Stockton and Middlesbrough. Counter notices had been received for advance of wages as follows: Hartlepool, Stockton and Middlesbrough labourers, ½d. per hour; Hartlepool bricklayers, 1d. per hour advance, and alteration of overtime rule and working hours.

After considerable discussion on the matter, it was resolved unanimously, on the proposition of Mr. T. Wilkinson, seconded by Mr. W. M. Thompson, "that the consent of the Federation be given to the Teesside Association to give notice for the alteration of the working hours and reduction of the wages of the operatives within the area governed by the Association with the object of securing uniformity of working hours."

The resolution received from the National Federation asking the members to refrain from sending in priced schedules with their tenders was considered. It was pointed out that the effect of this resolution is in operation in the Federation's area. After further discussion, it was unanimously resolved, on the proposition of Mr. Alex. Ross, "that a circular be drawn up and forwarded to each member of the Federation asking them to refrain from sending priced schedules in along with their tender, and to report any infringement to the secretary of the Federation."

With a view to collecting statistical information likely to be useful to the National Federation generally, the Administrative Committee again issued forms requesting a return of the number of members in the respective associations, and also the number of men and apprentices employed in the various trades in June, 1909. The response made by the local associations was very incomplete, although frequent applications have been made, and the secretary complained of the slackness of members in affording information.

The secretary's attention had been drawn to a recent article which appeared in the "Builders' Journal," and subsequent correspondence thereon, upon the question of Builders' Locked-up Capital, dealing with the unduly protracted delay in payment and final settlement. It was pointed out that by the National form of contract provision is made for payments, and that contractors should insist upon strict adherence to its conditions. After further discussion, it was resolved "to leave the matter in the hands of the secretary."

The National Conference of Secretaries to be held in Leeds on October 19th was discussed, and, on the proposition of Mr. J. W. White, seconded by Mr. Jos. Pelton, it was resolved "that the secretary of the Federation attend the Conference, and that the local associations be invited to send their secretaries."

The question of holding a Federation dinner was discussed, and that of selecting the town for the annual meeting of the Federation. The President of the Sunderland Association pointed out that the next visit was due at Sunderland, and said that in the event of that town being selected it was the intention of the Sunderland Association to invite the members of the Board of Representatives to their annual dinner, which would be held on the evening of the day of the Federation visit. He moved accordingly, and the resolution was seconded by Mr. J. T. Armstrong, and agreed to unanimously.

The advisability of issuing a Federation year-book was discussed, and it was resolved to refer the question to the consideration of the Executive Council.

It was reported that clause 30 of this Bill, calling for a survey every 5 years of dwellings below a certain rental, and the provision of a public register of their condition of repair, etc., has been struck out.

A letter from the Sunderland Association was read, drawing attention to the fact that the Durham County Council had specified a particular stone, thereby restricting competition to one particular firm and excluding Durham County stone from competition. It was resolved "that a letter be sent to the Durham County Council urging the desirability of giving a preference to this county's products, and that a copy of the communication be forwarded to each member of the Council."

An enquiry asked the practice as to handing over the final certificate. The secretary was directed to reply stating that it is the general practice in the North to forward the certificate to the contractor in accordance with the provision made by clause 30 of the National form.

A report was received upon the decision in the case of Blackwell and Co. v. The Derbv Corporation, which appeared in the "Derby Advertiser" of August 6th, where the Court of Appeal had allowed the application of the contractor to bring to the court for settlement a dispute with the corporation arising out of a contract in respect of which all disputes were referred to the arbitration of the corporation engineer.

Previous to the meeting, the members were entertained to tea by the Stockton Association, to whom a hearty vote of thanks was accorded for their hospitality.—W. H. HOPE, solicitor, secretary, Post-office Chambers, 14, Norfolk Street, Sunderland.

SOCIETIES' REPORTS.

Institution of Municipal Engineers.

Arrangements have been made with the Associated Portland Cement Manufacturers (1900), Limited, for the members of this institution to visit the company's works at Northfleet, on Saturday, October 16. The train leaves Cannon Street Station (S.E. and Chatham Rly.) at 11.42 a.m., calling at London Bridge Station, at 11.45. Arrived at Northfleet station, the party will walk to the adjacent factory hall, where they will be entertained at luncheon. At 2 p.m., special tram cars will leave the hall for Swanscombe Works. Visitors will be provided with dust-coats for use on the works, where the party will be divided into sections, each under the guidance of one of the company's officials, who will conduct them and explain the various processes: (1) The quarrying of the chalk on the properties of the company adjoining the works and the method of amalgamating the chalk and clay in the powerful wash mills and screening mills. The power house operating this section of the plant is driven by three Oechelhauser gas-engines, each of 400 h.p., which with four more engines of this type, driving grinding mills, have recently been installed at the works. (2) The slurry mixing and storage tanks, the largest having a capacity of 7,000 tons. These contain the mixture as pumped from the wash mills and before being delivered to the rotary kiln plant. (3) The rotary plant, which has a capacity of 7,000 tons of Portland cement per week, and consists of 16 kilns, each 130ft. in length. The two main steam-engines and generators of 1,000 h.p. capacity each, which provide the power for driving this and other sections of the works, will be seen in the engine-houses underneath the kiln floor. (4) Grinding Mills. The product from the rotary kilns, after passing through the cooling cylinders, is conveyed by means of transfer cars and an electric lift to the various grinding mills, where the clinker is reduced to a fine powder in preliminary ball mills and in tube mills for the final grinding. During the latter process the setting time

of the cement is regulated to any required degree by means of the hydrating apparatus, which will be shown and explained. (5) The cask making department, capable of turning out over one million casks per annum. The party will then proceed by a special train of improvised cars over the works railway to the new reinforced concrete jetty which has recently been completed on the banks of the Thames about a mile from the factory. After inspecting the warehouses, the Mason gas-producer plant and the works testing-room, where the setting time, fineness and other characteristics of the cement coming from the various grinding mills are continually being checked, the party will rejoin the tram cars. After tea in the factory hall, there will be a demonstration of the gauging and testing of Portland cement, including determinations of setting time, soundness, fineness, gauging of briquettes for tensile strength and testing of specimens. There will also be an exhibition of scientific and other special apparatus for the examination of Portland cement.

A REINFORCED CONCRETE THEATRE.

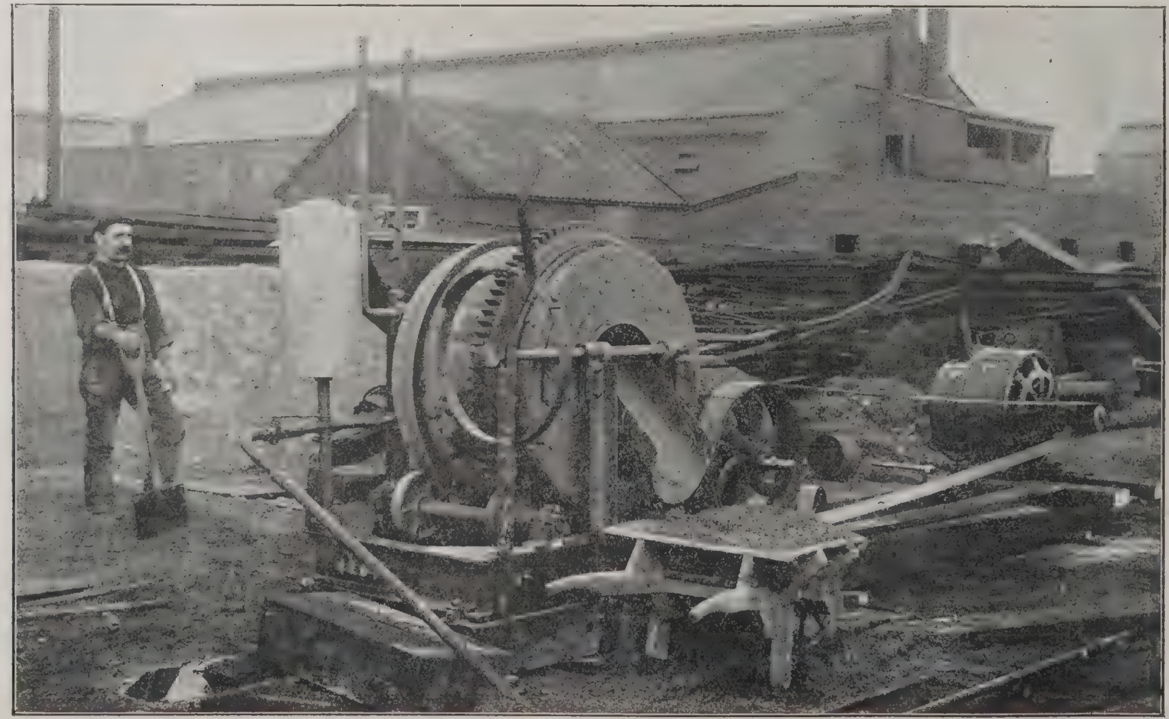
The little town of Agen in the department of Lot-et-Garonne, has achieved some distinction by the building of the first reinforced concrete theatre in France, the building being opened recently by the French President. The funds were bequeathed by a Mr. Ducourneau, after whom the theatre is named locally. The architect, Mr. Guillaume Tronchet, of Paris, is a native of Lot-et-Garonne, and it is significant of the manner in which these things are arranged in France, that the sculptors and painters employed to decorate the building are all natives of the same department. The builders were MM. Sainrapt and Brice, of Paris. The building rests on some fifty-four piles of lime concrete, varying in depth from 5 to 7 metres. On these rest the reinforced concrete beams that carry the superstructure. The principal facade is faced with Charentes freestone; while the side walls and part of the back wall are constructed of rough stone, rendered with a patent cement preparation, which is an excellent imitation of freestone. The stage walls are in ferro-concrete, 10 to 17 centimetres (about 4 to 7ins.) thick. Their height is 26 metres, ten below and sixteen above the stage level. The framework of the stage is of steel. All the dressing-room floors are of reinforced concrete 15 centimetres (about 6ins.) thick. The enclosing wall of the auditorium, the floors, corbel tables of the balconies, and the partitions between the boxes are also of ferro-concrete. The enclosing wall is 12 centimetres thick (about 4¾ins.), the floors 15 to 19 centimetres (about 6 to 7½ins.). The official tests showed a bending of barely 4-10ths of a millimetre at the most heavily loaded parts.

Trade and Craft.

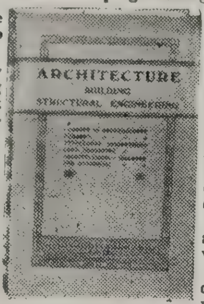
The Ransome Concrete Mixer.

The mixing machine for concrete has become a necessity of modern building methods. As we have repeatedly stated, a mixer is indispensable to ensure economy, rapidity, and standard production. The Ransome-ver Mehr Machinery Co., Caxton House, Westminster, have just issued a new and enlarged, well-illustrated and altogether finely produced catalogue, in which their mixer is effectively displayed, and its mechanism and operation are lucidly described. The drum is constructed of substantial steel plates riveted together, and revolves on two circular cast-iron roller paths riveted to it; and on the roller path nearest to the delivery chute is a cast-iron annular toothed rack, cast in one with the roller path. The frame is constructed of rolled or pressed steel channels, strongly connected together. Brass bearings bolted on the framing support the axles of the four cast-iron rollers, on which revolves the drum, with the two circular cast-iron roller paths riveted to it. The driving shaft, which is of steel, is also carried in brass bearings riveted to the frame, and a cast-steel pinion is keyed to the driving shaft. The fast-and-loose pulleys are of cast iron, and are keyed to the driving shaft on the side nearest the charging hopper. The discharge chute is made of steel plate, and is fixed in position by means of three vertical angle-irons, to the top of which are bolted cast brackets for carrying the quadrant and shaft by which the chute is supported and operated; these, and the lever for controlling the chute, are keyed to the shaft. Whilst the batch is being mixed, the chute is raised, and, by a simple lever movement, it is lowered to receive the concrete as it falls from the scoops, and thus directs the batch straight into the barrow or other vehicle; and the batch is discharged in five revolutions of the drum. The drum revolves continuously, and is lined with a series of steel scoops, which plough through the material over and over again, mixing it most uniformly and effectually and finally picking it up and discharging it. The stationary measuring hopper is constructed of steel plate; and the elevating hopper is so arranged that it can be lowered into a pit, or so that the bottom rests on the ground level. It will be seen from this brief description that the mixer is a thoroughly sound and strong piece of mechanism. Complete data, and copious illustrations are given in the catalogue under notice, which shows photographically, and by means of diagrams, all the component parts; while several views, from photographs taken at home and abroad, exhibit the Ransome mixer engaged in various interesting services.

The foundation-stone of Bethnal Green Municipal Buildings was laid on September 23rd by the Mayor, A. F. Barrard, J.P. The plans for the scheme were won in competition by Messrs. Robinson and Jones, of Leeds and London, theirs being considered by the assessor appointed by the Council, Mr. H. T. Hare, F.R.I.B.A., to be most suitable for the council's requirements. The elevations, one facing Cambridge Road, the other Patriot Square, are of Portland stone, and a Renaissance style has been adopted. The main entrance is in Cambridge Road, wherein the four principal offices of the borough will be located, viz., for the town clerk, borough treasurer, borough engineer, and surveyor, and the chief sanitary officer. The two former take up the front portion of the building, the latter being in the rear, which consists of offices. On the first floor are three large committee rooms and the mayor's room. The council chamber is situated on the north side, facing Patriot Square. There is a spacious public gallery, with access from the east end of the square. The contract for the erection of the building is in the hands of Messrs. Brand, Pettit and Co., and the entire costs will be about £26,000, inclusive of site and furniture, etc., £35,600. The clerk of the works is Mr. Archibald Brown.



THE RANSOME CONCRETE MIXER.



How far ahead you get in your work—and How much money you make—Depends entirely upon you!

The opportunities in every modern line of business—of commercial, technical and scientific endeavour of all kinds are really unlimited.

It is the men with the necessary training who are not available.

Any manufacturer—any proprietor of any thriving business forced to meet competition every hour—will tell you that the finding of men with a thorough understanding of specialised lines of work is his greatest problem.

We have letters from business houses as proof. Similarly, we have thousands of letters from ambitious men and women who, having completed specialised courses of study in the I.C.S. have been eagerly snapped up by just this sort of employer. Better positions—higher pay—that, in a nutshell, is the result of an I.C.S. training. It is the thorough, practical, step-by-step grounding in every department of a given line which makes the I.C.S. training the only one of its sort in existence.

No classes to attend—no books or apparatus to buy—not a lesson missed—no interference with your work or your pleasure—and the Students' Aid Department at the back of you when you have completed your course.

Let us send you free of any obligation, **facts** which will open your eyes.

Simply write on a postcard what line interests you most, and post it to the International Correspondence Schools, Ltd., Dept. **P. 156,** Kingsway, W.C. 'Your choice of over **120** courses.

KOH-I-NOOR

TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

Of Stationers, Artists Colourmen, Photographic Dealers, &c.

L. & C. HARDTMUTH, 12, Golden Lane, London, E.C.

L. & C. HARDTMUTH'S
KOH-I-NOOR
PENCIL

Is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

Workmen's Credentials. In discussing relief for the unemployed, a Dundee newspaper has unwittingly revived an old controversy. The writer thinks that the Dundee masons "are building better than they know in suggesting that the corporations and distress committees should recognise membership cards of trades unions as guarantees of the position of applicants for work," because "some of the most successful labour bureaus in England have been worked on the principle of requesting the exhibition of membership cards of trades unions or of credentials from employers showing work records." The writer goes on to suggest that "under the existing conditions of employment and unemployment, all wage-earners should be furnished with work record cards similar to the credentials carried by seamen;" when many of the difficulties of distress committees would disappear. It so happens, however, that while the English trade unionist is rather proud of producing his trade card upon any and every occasion, he has a curious objection to employers' credentials. It is, we believe, a matter of history that in the early days of the Operative Bricklayers' Society the men revolted against employers' credentials, flatly refusing to produce them when applying for work. Traditional prejudices like this die hard; and we have reason to believe that the bricklayers, at all events, still entertain a strong aversion to employers' cards. The objection, however, appears to be against compulsory certificates of character and competency, which, they allege, were subject to grave abuse. It might not hold good with regard to cards voluntarily sought upon urgent occasion.

Responsibility for Dry Rot. Dry rot is becoming a haunting menace to architects and builders. In yet another law case they have been held responsible for its ravages, the jury in a case that was concluded in the High Court on Thursday last having awarded £165 damages to a gentleman who claimed that he had suffered to this extent by the negligence of defendants in the way in which they put in pugging in the nursery floors of Greenstead Hall, Halstead. It was alleged that the pugging not being properly dry before being covered with the floorboards, which were tongued and grooved, caused dry rot, necessitating repairs that cost £125, and plaintiff claimed forty guineas for being consequently kept out of his residence for four weeks. It will be seen, therefore, that he got the full amount of his claim, minus the difference between pounds and guineas in the compensation for disturbance. In arriving at this decision, both the judge (Mr. Justice Grantham) and the jury, seeing that the plaintiff had indisputably suffered damage and inconvenience, thought that the architects and the builders ought to have prevented it. This is a very natural view to take. It is nevertheless a superficial view. Too much importance appears to us to have been attached to the alleged (but disputed) dampness of the pugging, and too little to the floor having been, by the client's order, covered with floorcloth, cemented with "stickphast." The judge, in reviewing the evidence, pointed out that "some of the defendants' witnesses said ventilation was necessary, while others said it was not. When expert witnesses talked that way," he said, "then the jury must use their common sense. Every one knew," he added, "that one of the causes of dry rot was dampness without ventilation. Was not that the case in the present instance?" We submit that the answer to that question does not solve the problem. The crucial question is, Why was ventilation deficient? and very possibly the correct answer is, Because the pores of the wood were choked. And that where transpiration is stopped, dampness is bound to occur, is, or should be, a matter of common knowledge. The moisture may be residual in the materials, or it may be condensed from the atmosphere. If absorbed from the room below, it gathers under an air-tight floor, there, with warmth from above and below, and with no through circulation of air, the fungus of dry rot flourishes and spreads. These three conditions—moisture, warmth, and stagnation—are essential to its life and propagation. Several witnesses maintained—though apparently the judge and jury thought otherwise—that in this case the third condition was supplied when the floor was rendered impervious. For this condition, it appears, neither the architects nor the builders were responsible. We cannot help thinking, therefore, that to make them pay for the damage is to inflict on them an unmerited hardship. We have no interest whatever in this particular case, or in any of the parties to it. We comment upon it simply because we feel that it affords a precedent for imposing on architects and on builders an unfair burden of responsibility. Granted that the client has in every case a right to expect competency and care, and that he should have a remedy for incompetence or negligence, yet these faults should be absolutely proved before exacting the penalty. Granted that it is incumbent on architects and builders to see that the timber they put in is sound, and that the structural conditions are such as shall not favour the development of the fungus, yet they should not necessarily be held responsible for every case that arises, because the disease may break out from causes that are beyond their control. We feel, therefore, that architects and builders should immediately take steps to protect themselves against the dangerous assumption (to which the result of this action lends weight) that they are in every instance responsible for the ravages of dry rot. They are bound to do all in their power to prevent it; but it should be clearly recognised that this disease of timber is obscure, insidious, and may break out in spite of the utmost skill and foresight, while the exciting cause may be due to circumstances with which the architects and builders have had nothing whatever to do, and for which they cannot justly be held responsible. The tendency to hold them responsible in every case should be resisted; and, during the past few years, the matter has gone so hardly with them in the courts that we think it ought to be set upon a more equitable basis. The first step is to ascertain, collect, and collate all the available data and evidence. It might then be possible to define the conditions in which architects and builders are, or are not, responsible for the ravages of dry rot; and it might be desirable to devise a saving clause for insertion in contracts, defining and limiting responsibilities that have become extravagant and intolerable. Here is work that the Royal Institute should promptly take in hand with the same thoroughness with which they have carried out other investigations for which the entire community of builders is grateful to them; for it is a subject in which the interests of architects and builders are in need of protection, and it is time that a firm stand should be made.

The Development and Housing Bills.

The Development and Roads Improvement Bill, which was explained by Earl Carrington as having for its objects to aid and encourage agriculture and rural industries, including forestry, reclamation and drainage of land, improvement of rural transport, the construction and improvement of inland navigation and harbours, and the establishment of a Road Board for the whole of the United Kingdom, was read a second time in the House of Lords on Thursday last. The duties of the Board would be to administer what is called in the Bill the Road Grant, which will be the £600,000, more or less, which in the Budget is supposed to be obtained from the motor and motor spirit taxes. The money will be spent in the construction of new roads or in the formation of existing roads; but the Road Board will only construct or maintain new roads. The Bill gives the Board power to take, besides the land necessary for the road, 220 yards on each side of it, so that "money spent by the State for public utility, comfort, and safety, should not be used to develop the estates of individual owners." In Committee, the Bill, Lord Lansdowne drily remarked, is likely to be rendered "a little less ambitious." The Lords should by this time have become quite expert in the gentle are of checking vaulting ambition of this kind, the Housing and Town Planning Bill, which they had passed on October 11th, having been rendered almost unenterprising in comparison with the state in which it left the Commons, although the Government do not seem strongly disposed to endorse Lord Crewe's view that if the Earl of Malmesbury's amendment—giving power to award just compensation to an owner whose property is deemed by the arbitrator to be injuriously affected by the operations of a town-planning scheme—were carried, it would be absolutely impossible to proceed with the Bill. The amendment was carried by 80 to 14, and as yet the Bill has not been abandoned! To say that the Bill has been ruined in its passage through the Lords is to betray an excess of political prejudice. It has certainly been clipped and trimmed pretty closely, but without detriment to its root principles.

San Francisco's Simultaneousness

The Portola Festival began yesterday. It is called Portola because the Spanish general of that name discovered San Francisco in 1769, and was the first Governor of California. If he had never discovered it, perhaps fire following an earthquake would never have "wiped it out"—or, alternatively, perhaps this festival would have borne some other name. No matter how it is called, it is certainly a great occasion. Rather more than three years ago, San Francisco was a heap of blackened ruins, and even its richest men were "standing in the bread-line, drawing rations." To-day, a brand-new San Francisco, rebuilt in three years, at a cost of some forty million pounds sterling, is celebrating its resuscitation. The festival is to last from October 19 to October 23, and there are parades, banquets, and pageants toward. Yesterday was adopted the great idea of the simultaneous universal toast. At noon, San Francisco time, yesterday, President Taft raised his glass, "To the American spirit of enterprise, courage, and energy, that made possible the rebuilding of a city in three years," and to that toast a glass was raised "wherever an American was to be found," although there must have been occasionally some difficulty in calculating the correct moment. In London, noon of San Francisco was represented by 8 p.m. It was a curious observance, but not without its value both emotional and practical—the typical blend of the American people. We trust that San Francisco's experiences of simultaneous toasting may never be less pleasant. We have no doubt that, on the whole, the buildings that have been reared in so short a time are æsthetically worthy of the temperament and the toast. We trust that at any rate they will be so well adapted to their environment as to defy earthquake and fire, and thus render unnecessary any repetition of the tremendous feat of entirely rebuilding a great city in three years. Like the toast, it was a wholesale order. Rebuilt San Francisco will perhaps be worth studying from the point of view of the town planner.

The Question of Quantities.

The quantities question is, we believe, approaching something like a crisis. Builders and contractors are growing weary of the heavy burden that is unfairly imposed upon them when they are required to take out the quantities for works for which tenders are desired. To ask a builder to do this is to ask him to undertake another man's work and to incur out-of-pocket expenses upon which it is many chances to one that he will get no return. If he does not secure the contract, he will realise a dead loss on the cost of getting out the quantities. If there are fifty builders tendering under these iniquitous conditions, forty-nine of them will suffer this dead loss. The substance of forty-nine builders must be callously wasted, because the architect or his client is too indolent or too short-sightedly selfish to provide the necessary data for the estimate. What, after all, does the client really save by this policy? No more than the paltry cost of duplicating the copies of the bills; for it is to be presumed that the charge of getting out the quantities will be included in the amount of the successful tender; but those who are unsuccessful tenderers must lose it with the job, realising a loss upon a loss. And the loss is multiplied for the trade by the number of the builders tendering. They lose a good deal over the mere preparation of the estimates. The system is at best but wasteful. It need not be rendered additionally abhorrent by the imposition of this quite unnecessary burden, which wastefully and extravagantly increases the general cost of building by adding to inevitable charges a considerable item many times magnified. Why demand such quantities of quantities, when one set, properly manifolded, would be ample and comparatively inexpensive? The method is wrong because uneconomical. It is wrong for other reasons. It hampers and harasses the builder in his preparation of the tenders. It multiples not only labour and expense, but the chances of error, and it shifts on to the shoulders of the contractor the responsibility for that error. Moreover, this ill-advised practice deprives the competitors of the common basis for tendering which would place them all, to this extent at least, on an equal footing. It robs them of a fair start and produces a set of tenders entirely misleading to the client, who finds it impossible really to appraise their respective relative values because of the different views taken of the work by the various surveyors who have made up the various quantities. In the North, contractors have made a strong stand against this iniquity. In the South, we regret to have observed a tendency to tame submission to it. Some of the bigger firms, we have been told in terms that are perhaps more graphic than polite, keep a tame quantity surveyor on the premises, but we understand that this ignoble attitude is likely to be abandoned. The evil has become too gross for further toleration, and important steps are being taken to put an end to it. We print, in another part of the present issue, a brief statement showing the trend of a movement that should tend towards amelioration. The position of the quantity surveyors is curious. If, by means of the reform advocated, fewer sets of priced quantities are required, quantity surveyors will get less work to do; and yet, realising this very clearly, they are, we understand, prepared to support the movement as a matter of pure principle. Theirs is an eminently honourable attitude. Needless to say, we shall watch that movement with intense interest, and, so long as it goes in the right direction, shall give it our hearty support.

LONDON'S ROMAN WALL.

The excavations which were necessary for the foundations and sub-structure of the extensions of the General Post-office on the site of Christ's Hospital (Bluecoat) School brought to light a considerable run of the old Roman wall, which at one time practically encircled the city. Interesting evidence of the materials used in its building was brought within view. The Archæological Society took a considerable interest in what was disclosed, and came to the conclusion that further excavations would result in more important work being brought to light. For this purpose the Society obtained permission to continue the digging in an easterly direction, at the point where the wall was known to make a turn in the direction of the Old Bailey. Subsequently the footings of an ancient bastion have been revealed. It apparently had a diameter of about 25ft., and the probability is that a tower also existed on this spot. On the outer circle of the bastion the depth of the moat has been reached, and some remains of pottery and glass have been found there. The accompanying view illustrates the work as it stood at a recent date. The bastion was built somewhat differently from the wall (which was of alternate courses of stone and tile), stone only being seen in the bastion. The blocks vary somewhat in size, averaging about 15in. × 12in. × 6in. and were laid in lime. The work unearthed is certainly one of the most interesting sights relative to the ancient history of the City that have been seen of recent years, and the pity is that it cannot be kept permanently open.

Our Plate.

We give in our centre-plate the concluding illustration of Eagle House, Mitcham, with a measured drawing by Mr. Joseph Seddon on p. 306. This interesting old house is an excellent example of the roomy and comfortable dwellings of its period. The details shown in this issue include the panelling of the saloons, in which rooms the original grates still exist; also the panelling of the drawing-room and some details of the hall.

The death has occurred, at the age of 61, of the sculptor, M. Tony Noël, professor at the Paris Ecole des Beaux-Arts. M. Noël obtained the Prix de Rome in 1868. At the Universal Exhibition of 1889 he obtained a "Grand prix," and he was a member of the Conseil Supérieur de l'Enseignment des Beaux Arts.

Societies' Reports.

Architectural Association.

At the annual general meeting of the Architectural Association, held on October 8th, the following prize-list was presented:—

G. G. Wornum, A.A. Travelling Studentship, value £25, and medal; C. G. Boutcher, 2nd Prize, A.A. Travelling Studentship, value £5; H. F. Murrell, A.A. Essay Prize, value £10 10s., and silver medal; W. J. Durnford, Banister Fletcher Bursary, value £26 5s., and silver medal, Book Prize for first place Advanced Physics; L. M. Gotch, Architectural Union Company's Prize, value £20; B. F. Matthews, Hon. Mention, Architectural Union Company, and Special Prize, value £5 5s., Book Prize, 4th year Evening School; R. Cromie, Special Prize, Saxon Snell Studentship, value £10; W. D. Cathcart, Elementary Class of Design Prize, value £3 3s., and bronze medal; Alan Snow, Advanced Class of Design Prize, value £5 5s., and bronze medal; E. L. Apperley, 1st year Day School, Book Prize for 1st place in History Test Paper, Book Prize for 1st place in Construction Test Paper, Prize for 1st place in Perspective Drawing Test; R. C. Stevenson, 1st year Day School, Book Prize for 1st place in Construction Test Paper, Studio Prize for best portfolio of drawings during session; T. F. Ford, 1st year Day School, Book Prize for 1st place in Geometry; C. Rowntree, 1st year Day School, Book Prize for 1st place in Physics; A. E. Maxwell, 1st year Day School, volume of A.A. Sketch Book for 1st place in Freehand Drawing Test, Special Studio Prize; F. A. Crouch, 2nd year Day School, Travelling Studentship, value £15, Book Prize for 1st place in Intermediate Physics; H. B. Chishold, 2nd year Day School, 1st place in "End of Session Test"; D. J. S. Dawson, 2nd year Evening School, Scholarship, value £15 15s., Book Prize for 1st place in Preparatory Physics; H. D. Kidd, 2nd year Evening School, Book Prize; H. V. C. Curtis, 2nd year Evening School, Master's Prize; P. D. Hepworth, 3rd year Evening School, Studentship, value £15; H. E. Moss, 3rd year Evening School, Book Prize; H. A. Gold, 3rd year Evening School, Master's Prize; C. A. Farey, 4th year Evening School, Travelling Studentship, value £15; R. M. Pigott, 4th year Evening School, Master's Prize; Norman Keep, Book Prize for 1st place in Elementary Construction; G. H. Inman, Book Prize for 1st place in Geometry; G. M. Eaton, Book Prize for 1st place in Greek and Roman Architecture; R. N. Jackson, Book Prize for 1st place in Greek and Roman Architecture, Book Prize for 1st place in Renaissance Architecture; C. W. Rogers, Book Prize for 1st place in Early Christian and Gothic Architecture; P. J. Adams, Book Prize for 1st place in English Architecture, Book Prize for 1st place in Materials; H. A. Thomerson, Book Prize for 1st place in Drainage; G. Flint Clarkson, Book Prize for 1st place in Ventilation, Book Prize for 1st place in Iron and Steel Construction, Book Prize for 1st place in Advanced Construction, Book Prize for 1st place in Architectural Features, Book Prize for 1st place in Professional Practice.

The following students have been recommended by the visitor, Mr. Ernest Newton, for the Board of Architectural Education Certificate, which entitles them to exemption from the R.I.B.A. Intermediate Examination:—R. W. Cable, G. F. Clarkson, C. A. Farey, A. V. Sutherland Graeme, G. W. Home, G. D. Gordon Hake, L. Keir Hett, T. A. Lodge, B. F. Matthews, C. E. Fellowes Prynne, I. M. Pritchard, R. M. Piggott, A. D. Robinson, F. H. Swindells, E. J. Tanner.

The following students have been awarded the Association Two Years' Course Certificate:—E. S. A. Baynes, A. G. Butler, J. A. Cheston, H. B. Chisholm, F. A. Crouch, B. P. Gaymer, J. O. B. Hitch, L. D. Martyn, E. W. Mountford, C. W. Rogers, S. E. Shurmur, R. Talvalker.

Society of Architects.

The twenty-fifth annual report of the Council, which is to be presented at the meeting to be held to-morrow, shows that sixty members, two honorary members, and forty-two students, have been added to the register during the past twelve months, and two members have been transferred to the retired list; and after allowing for deaths, removals, and resignations, the total membership stands at one thousand, an increase of twenty-five over last year. As to registration, it was reported that although no progress has been made in Parliament with the Bill promoted by the Society, the registration movement has made great strides during the past year. Early in the session the Council was approached by the South African Branch for a donation towards the expenses to be incurred by the Transvaal Institute of Architects, in promoting a Bill for the Registration of Architects in that part of the Empire. The Council responded by at once sending a sum of £50, with an assurance that any further assistance which the Society could give would be at the disposal of the branch and of the Transvaal Institute. The Society's branch took up the matter energetically. The president of the branch, Mr. R. Howden, and the hon. secretary, Mr. E. H. Waugh, visited Cape Town and other centres, when reciprocity was arranged between the architects of different South African Colonies. The Transvaal Institute also worked hard in the same direction, with the result that a Bill was drafted and read a first time in the Assembly at Pretoria, at the end of June. It was then referred to a Select Committee, who, after hearing the evidence of the promoters, recommended the Bill for adoption by the House, and on July 7th the Bill was read a third time and passed without opposition. The share which the Society of Architects took in this matter has been most generously acknowledged by the Transvaal Institute of Architects. While the Transvaal architects were so successfully engaged, those at home were doing everything possible to bring about unanimity of purpose with the same object in view. The Institute of Architects in New South Wales is also actively taking the matter up, and has issued a petition with a view of strengthening its hands in approaching the Government. The Council is of opinion that the time is not far distant when some form of registration, on the lines so long advocated by the Society, will become an accomplished fact in the United Kingdom. The half-yearly examinations to qualify for membership have been held at London, Manchester, Johannesburg, Cardiff, and Oxford, the two latter being new centres.

The Society's certificate is accepted by the Transvaal Government as a qualification for registration as an architect, under the new Act. Several alterations have been made in the syllabus, the principal being that candidates failing to qualify in any subject shall be allowed to sit again at either of the next two examinations without further fee, and that "Contracts and Specifications" are now taken together. The time on these subjects and also on "Quantities and Prices" has been extended with a view of enabling candidates to do more justice to the subjects than hitherto. The Architectural Association Day School Course and the P.A.S.I. Certificate (Building Sub-division) are now accepted as exemptions in Sections I. and II. and Section IIIb. respectively. An increasing number of students avail themselves of the opportunity offered of qualifying for membership by stages, through the medium of the sectional examinations. The examination for the architectural scholarship, 1909, was held in London, in April last, but the Council was unable to award the scholarship. Early in the year a Committee was elected, which appointed Mr. H. V. M. Emerson, A.R.I.B.A. (Member of Council), as chairman, and Mr. H. Y. Margary (student) as hon. secretary. The committee has been very active and has made a number of suggestions for the development of the section, most of which the Council has been able to adopt. A feature of the work has been the very successful series of sketching parties, organised by Mr. H. Y. Margary and his committee, which took place as follows: May 15th, St. Albans, under the guidance of Mr. Chas. H. Ashdown, F.R.G.S.; June 11th, Hatfield House; July 17th, Mertham and Gatton; September 11th, Rochester, under the auspices of the president, Mr. G. E. Bond, J.P., who has offered a prize of the value of £3 3s. for the best work done during the first session by the students; and arrangements are being made for a "Students' Night" early in the new session, when the sketches and drawings will be exhibited. The Travelling Studentship Competition continues to attract a good deal of attention, twenty-five sets being received and adjudicated upon. The subject this year was a secondary school to accommodate 100 boys and 100 girls. Mr. Chas. H.

Photo: Bolak.

ROMAN BASTION WALL RECENTLY UNEARTHED IN THE CITY OF LONDON (*see opposite page*).

Hudson, of London, secured the first place, while the design of Mr. Geo. Ll. Evans (London) was placed second, and a special prize of £10 awarded to him by the Council. Mr. Hudson—who has been successful in other smaller students' competitions—selected Oxford for his touring centre, as did also Mr. Evans. Mr. Edgar M. Leest, J.P. (Member of Council), again offered a prize of the value of £3 3s. to be competed for by the students. The subject selected was "A Volunteer Fire Brigade Station for a Country Town," the competition being confined to students whose age did not exceed twenty-three on March 1st. Six sets of designs were received, but none were considered of sufficient merit to justify any award being made. The whole of the designs submitted in the Travelling Studentship and the Fire Brigade Station Competitions were on view in London during the first week in June, and a selection of the former were subsequently exhibited at Cardiff and Birmingham. The second year of the Correspondence Classes, which are in charge of Messrs. James Bartlett and Chas. H. Mead (members of the Council), came to a conclusion in June, when Mr. J. Pickup, of Blackburn, secured the Council's prize of £2 2s. for first place in the Advanced Class, Mr. D. H. H. Barry, of Eastbourne, being placed first in the elementary, taking the prize of £1 1s., which it may be remembered Mr. Pickup secured the previous year. It is proposed next session to offer prizes of the value of £1 1s., £2 2s., and £3 3s., to the students heading the lists in the first, second, and third years, respectively. The Council has gone with great care into the matter of unemployment assurance, and has decided that it is not advisable at present for the Society to attempt to deal with it.

Liverpool Architectural Society.

The report of the sixty-first session (1908-9) of the Liverpool Architectural Society, issued from 13, Harrington Street, Liverpool, states that the membership consists of 54 Fellows and 77 Associates—total 131—as compared with 56 and 69—total 125—last session. There are three hon. Fellows, nine hon. Associates, and 28 students. It is again noted that during the year the Council have been approached by the Manchester Society of Architects with a view to concerted action between the two societies with respect to architectural competitions. The Council have accordingly appointed a competitions committee to take action in the cases of competitions—more especially those belonging to the county of Lancaster; in which, in the judgment of the committee, the general conditions are not satisfactory, and the committee have taken action with respect to several competitions. In conjunction with the Manchester Society, a carefully worded and definite form of conditions of competition has been drafted, with the object of bringing about the general adoption of a recognised form of conditions of an equitable character. Particulars are given of the University of Liverpool Faculty of Arts, and there is an attractive list of prospective arrangements. The president is Mr. T. E. Eccles, F.R.I.B.A., and the hon. secs. are Mr. Gilbert W. Fraser, A.R.I.B.A., 20, Castle Street, and Mr. Ernest C. Aldridge, 14, Castle Street.

Cardiff, South Wales and Monmouthshire Architects' Society.

The members of the Cardiff, South Wales, and Monmouthshire Architects' Society (hon. secretary, Mr. G. A. Birkenhead, M.S.A., 102, St. Mary Street, Cardiff) have visited the new University College Buildings, and were shown over by the architect, Mr. W. D. Caröe, F.R.I.B.A., who pointed out various features, from the basement to the roof. The method of heating, ventilating, and lighting were explained, and various details of construction were pointed out. The members particularly admired the architectural features of the entrance hall, the splendid library, and the council room. At the end of a most enjoyable and interesting visit a hearty vote of thanks was tendered to Mr. Caröe upon the proposition of Mr. E. Seward, F.R.I.B.A., seconded by Mr. E. H. Fawckner, F.R.I.B.A.

Northern Architectural Association.

A party of about thirty members of the Northern Architectural Association assembled at Scotswood Council Schools, where Mr. Graham, the clerk of works to the Newcastle Education Committee, explained various matters of interest in the unavoidable absence of the architects, Messrs. Fenwicke and Watson. On leaving the schools the party proceeded to Denton Hall, which is a most interesting example of early seventeenth century domestic architecture, and contains many features of particular interest to architects. On arrival at the hall members were received by Mr. Forster Armstrong, who is now in residence at the hall, and who gave a most cordial welcome, and explained the many features of interest in the hall. After a careful inspection of the house and gardens, the party were hospitably entertained by Mr. Armstrong, who was accorded a hearty vote of thanks for his kindness. The meeting was the last one of the summer session, and the opening meeting of the winter session takes place on November 10th, when the president is to deliver his inaugural address.

London County Council School of Building.

The Prospectus and Time Table of the London County Council School of Building, Ferndale Road, Brixton, S.W., shows that the school is divided into three sections—namely, (1) Trades Classes; (2) Building Construction and Allied Subjects, and (3) Architecture and Drawing. The first section includes brickwork; carpentry and joinery, staircasing and handrailing, joiners' machine class; masonry; painting and decorating; plastering; plumbing, ornamental leadwork, iron pipe-work, etc.; sanitary engineering; stone carving, wood-carving, and modelling; and wrought ironwork. In the second section are comprised builders' book-keeping; builders' estimating; builders' office routine; building construction, mechanics of building, and constructional steelwork. In the third section are architectural design; details, and perspective drawing; architectural history; freehand and model drawing; lettering and inscriptions for drawings; sketching and measuring buildings and details. The principal of the staff is Mr. H. W. Richards, who has for assistant Mr. Arthur R. Sage; while the Director of Architecture is Professor Beresford Pite, F.R.I.B.A. There are ample facilities for workshop practice; and the building construction drawing office, as illustrated in the prospectus, appears to be large and convenient. There is also a day technical school for boys.

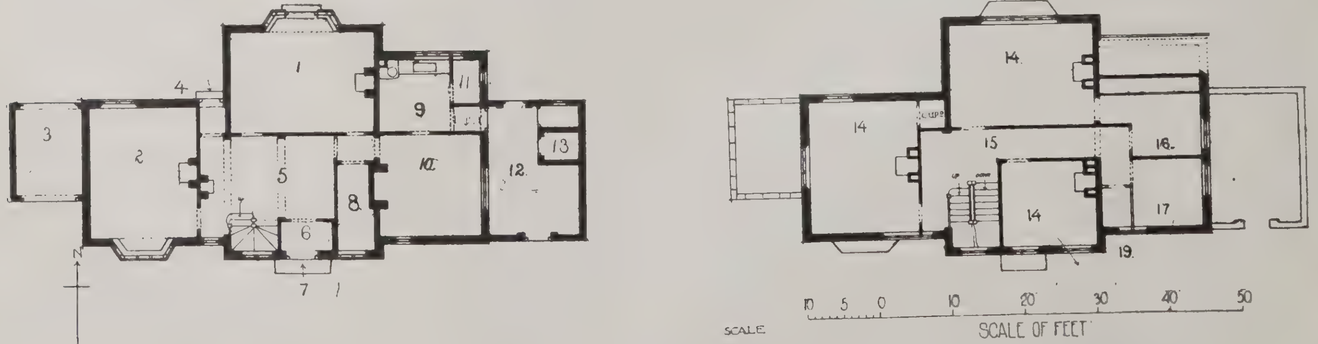
LIVERPOOL SCHOOL OF CIVIC DESIGN.

Appropriately, the prospectus of the Department of Civic Design in the University of Liverpool School of Architecture is of handsome and dignified appearance. It contains several plates; the frontispiece, by Prof. S. D. Adshead, showing a noble scheme for dealing with the approaches to the British Museum. Rather more ambitious and not less charming is the birds-eye view, by the same architect, of a proposed laying-out of St. Michael's and Fulwood Park, Liverpool. If some day these beautiful dreams are realised, the influence of the first Professor of Civic Design will be gratefully recalled.

In the introduction to the prospectus it is stated that the School of Civic Design owes its inception to the very evident demand which exists for a system of training in the broader aspects of architecture and engineering, and that it is the first organisation of its kind exclusively designed to meet the students who wish to study this subject. It is noted that town planning, although intimately connected with architecture and engineering, is a distinct and separate study in itself, and the primary object is to supply a knowledge of the supplementary subjects which town planning connotes, and to equip architects, engineers, and others, for the "advisory and permanent positions which must necessarily be created as legislation affecting civic development and extension becomes increasingly efficient."

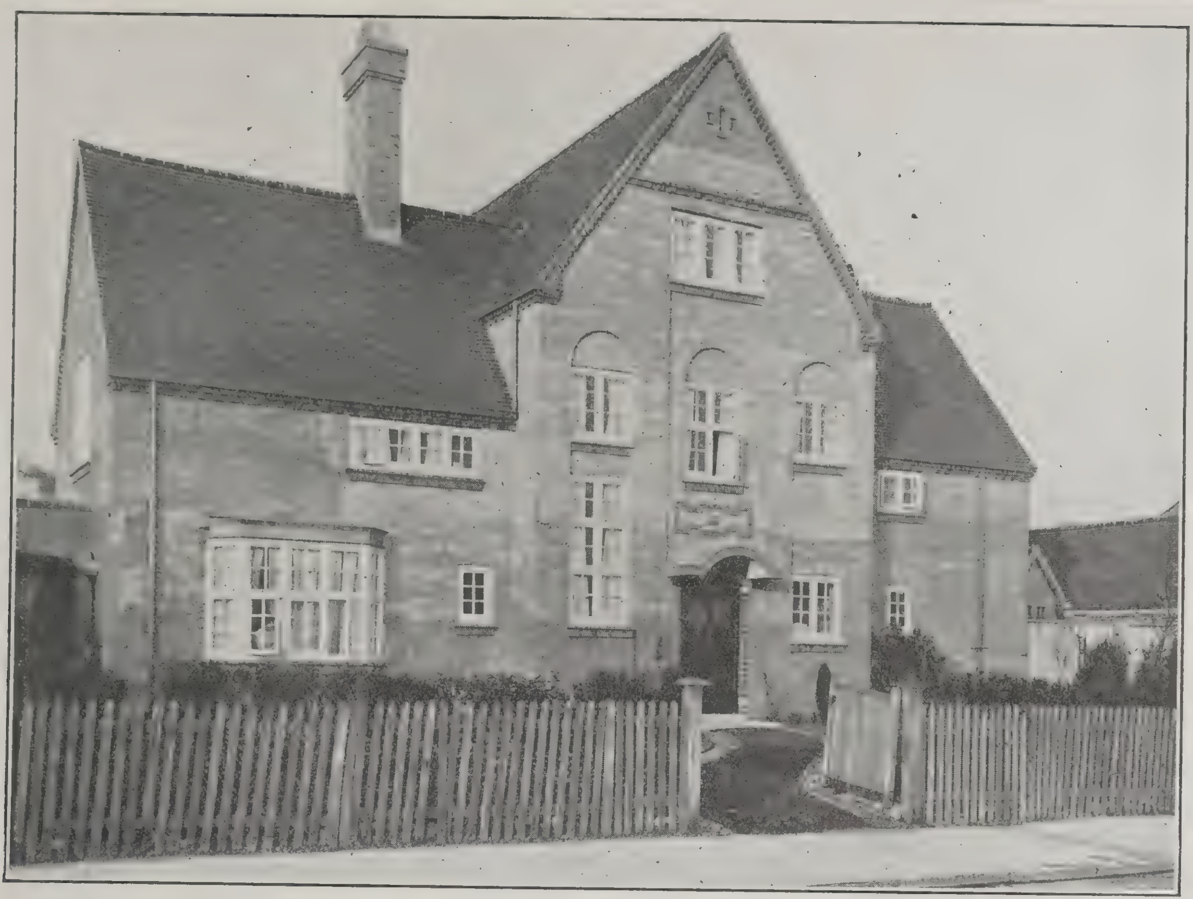
The school is intimately connected with the School of Architecture, of which it forms a department, and the students of both schools will pursue their studies together, and the teaching of draughtsmanship in its higher branches will form a very important part of the work. Mr. W. H. Lever, M.P., who has endowed the chair, has also given three prizes, of £20, £10, and £5 respectively, to be competed for annually by students of the two schools, for a scheme for laying out the remaining unoccupied land at Port Sunlight, and he further offers to pay £100 for the right to execute any of the schemes submitted for these prizes.

There are two courses of study—the Certificate and the Diploma. The former includes the development of the city and the influences affecting its growth, civic engineer-



HOUSE AT EDGBASTON, BIRMINGHAM. H. T. BUCKLAND AND E. HAYWOOD-FARMER, ARCHITECTS.

1.—Dining-room. 2.—Drawing-room. 3.—Motor. 4.—Garden Door, 5.—Hall. 6.—Porch. 7.—Entrance. 8.—Cloaks. 9.—Scullery. 10.—Kitchen. 11.—Larder. 12.—Yard. 13.—Coal. 14.—Bedroom. 15.—Upper Hall. 17.—Bathroom.



HOUSE AT EDGBASTON, BIRMINGHAM. T. H. BUCKLAND AND E, HAYWOOD-FARMER, ARCHITECTS.

This house is built of common local bricks, finished in cement rough-cast; the roof is covered with red sand-faced tiles. The chimneys are faced with thin Black Country bricks of varying tints, pointed in white mortar. The joinery of red deal is painted white.

ing and hygiene, law as related to town planning, civic architecture, civic decoration, landscape design, and studio work. The Diploma course includes the preparation of at least two town-planning schemes for definite areas, and plans, supplemented by written matter, presenting general provisions; studies of the details of one of the above schemes; a study for the reconstruction of an existing area; design for an incident in town planning to special conditions. The staff is as follows:—Professor of Architecture, C. H. Reilly, M.A., A.R.I.B.A.; Associate Professor of Civic Design, S. D. Adshead, F.R.I.B.A.; Civic Design Lecturer and Research Fellow, P. Abercrombie; Landscape Design Lecturer, T. H. Mawson, Hon. A.R.I.B.A.; Civic Engineering, Associate Professor, J. A. Brodie, M.Inst.C.E., etc.; Professor, S. W. Perrott, M.A.I., etc.; Civic Hygiene, Professor, E. W. Hope, M.D.; Civic Law Lecturer, H. Chalmer Dowdell, M.A., B.C.L.

A paper on "The Growth of Cast Irons after Repeated Heatings" was contributed to the autumn meeting of the Iron and Steel Institute by Professor H. F. Rugan (Tulane University of Louisiana) and Professor H. C. H. Carpenter (Victoria University, Manchester). The main cause of "growth," they said, was the disintegration of the material caused by the oxidation of the iron silicide. In close-grained irons the pressure of gases also contributed to the growth. At the close of the process the oven lost the properties of cast iron, and could be sawn like a piece of chalk. The authors recommended that white irons should be tried for annealing ovens instead of grey. Mr. J. E. Stead (Middlesbrough) said that the oxidation of grey iron followed along the sides of the graphite plates, which with each heating became more open from the metal and allowed of the entrance of oxygen. Professor Thomas Turner (Birmingham University) said that in the case of white iron, so long as it remained white there was no expansion, which, however, took place as soon as the iron deposited its carbon. The expansion was something like the process that took place in lead on a roof, which only expanded downwards under the heat of the sun, until it gradually "walked off" and fell to the ground. The iron in a soft state was surrounded by a hard case, and when it wanted to shrink back to its original state it could not do so.

* * *

Sir W. Richmond, speaking at Sheffield at the annual convention of the National Association of House Painters and Decorators, said there was an enormous population in which good taste was practically nonexistent. He referred to the great mass comprising the lower and upper strata of the middle classes. The agricultural peasant may be a boor; the town-bred middle-class man is a Philistine. The former may have chances of development; the latter is self-sufficient, self-occupied, inelastic, respectable, and dull. Discussing the decoration of a house, Sir William said a wall paper was an undesirable companion for many reasons. Good or bad it was difficult to cleanse. Germs were harboured in the old paste or decaying paper. There was a disinclination to remove it when rooms were being repapered. There were excellent distempers which fixed powder colours, and were washable and permanent. He advocated the use of these instead of wall paper. He advised the selection of the lightest tones. Under present conditions of the atmosphere in cities light rooms were essential on every account. It was true dirt was more visible on light than on dull effects. But surely it was better to see the dirt than not. It was a sign that cleaning was necessary. On the whole, the most effective, healthiest, pleasantest room to live in was a white room. There was no white so pure as lime; no product was so successful in the slaughter of offensive animal matter. Every coloured object, save dark ones in large masses, looked well on white, which in his opinion was the safest of all tints to use in large quantities. White walls almost doubled the appearance of the air they environed. He recommended the avoidance of oil or varnished white leads on walls. Washable distemper supplied a want and deserved attention. It was undesirable to varnish woodwork. It had better receive a subdued polish. As to furniture, the simpler the better, always of unpolished wood.

* * *

Berkhampstead House, Herts, an Elizabethan building, partly of flint, with fine old gardens, the whole extending to about 12½ acres, was recently put up for sale, but was bought in at £11,500. It stands 470ft. above sea level, overlooking the ruins of Berkhampstead Castle and the common. In 1650 a Parliamentary survey of the demesnes of the Honor of Berkhampstead was made by Parliamentary Commissioners preparatory to the sale of Crown lands. A quaint description of the property, as it then appeared, is preserved in the Public Record Office. It may be summarized as follows:—"That capitall mess'mansion scituate on a hill, and built with flint and Taternell stone cheqr. fashion, w'ch doth much adorn and set fourth same, and covered with slatt; great parlor wainscotted from the floore upp to the seelinge, very badd floored, but well lighted and seeled, kitchen paved with flour, well fitted and joynted. Above stayres one room called the dyneing room." Whether the house, of which other details are also given, was included in the valuation is not clear, or whether it was an attempt to value the site apart from the buildings, at any rate the document ends thus:—"The ground whereon the said houses stand together with the courts, yards and gardens is comprehended in the admeasuremt of the parke, and is worth per annum xxx-*l*." During the term of a lease granted in 1660 to Jerome Weston, Earl of Portland, the greater part of the house was burned down.

INSTITUTE OF BUILDERS ANNUAL DINNER.

The President on the Work of the Institute.

The annual dinner of the Institute of Builders took place at the De Keyser's Royal Hotel, Victoria Embankment, E.C., on Tuesday, October 12th. There was a good attendance, and the President of the Institute, Mr. W. F. Wallis, J.P., occupied the chair. Others present:—Messrs. Ian MacAlister, Secretary R.I.B.A.; J. W. White, J.P.; S. Smethurst, J.P.; F. G. Rice, President, London M.B.A.; Ernest J. Brown, President, National Federation of Building Trade Employers; E. E. Humphreys; F. G. Wallis; H. E. Matthews, F.R.I.B.A.; F. W. Ruck; G. E. Bond, J.P., President, Society of Architects; T. J. Bailey, F.R.I.B.A., Architect, L.C.C. Education Department; C. W. Ferrier; F. L. Dove, L.C.C., Past President, I.O.B.; Henry Tanner, jun., F.R.I.B.A., President, Architects' Association; Alex. R. Stenning, F.R.I.B.A., President, Surveyors' Institution; Edwin T. Hall, F.R.I.B.A., Vice-President, R.I.B.A.; James S. Gibson, F.R.I.B.A., Vice-President, R.I.B.A.; H. T. A .Chidgey, President, Quantity Surveyors' Association; Wm. Shepherd, Past President, I.O.B.; Leonard Horner, Vice-President, L.M.B.A.; G. Marfarlane, Sidney Leaning, F.S.I.; C. H. Barnsley, Past President, I.O.B.; Fred. Higgs, Vice-President, I.O.B.; R. W. Neill, J.P., Vice-President, I.O.B.

The loyal toasts having been honoured,

Mr. F. G. Rice, President of the London Master Builders' Association, gave the toast of "The Architects and Surveyors." Mr. Rice said that in calling upon him to perform the duty of proposing this toast, the Institute had paid a compliment to the London Master Builders' Association, which he could assure those present was highly appreciated. Architecture he said was one of the most agreeable and fascinating professions a man could enter. The closer attention architects were now giving to town planning was a matter for satisfaction, although he was afraid it came too late for London. One of the things for which he envied the citizens of Paris was the beautiful grouping of the squares in their city; and, if architects had only given the same attention to the grouping of buildings and the formations of squares in London, our great city would have been the envy of the world in every respect. He expressed his deep gratitude, especially to the Royal Institute of British Architects, for the way in which they dealt with a Bill which came before Parliament, a piece of grandmotherly legislation the object of which, its promoters declared, was to facilitate and safeguard building, but which, had it not been for the prompt action of the architects and others interested, would have resulted in greatly retarding British building. With the toast he coupled the names of Mr. Tanner, jun., and Mr. Stenning.

Mr. Henry Tanner, junr., F.R.I.B.A., President of the Architectural Association, said that it was not until recently he became aware of the difference between the Institute of Builders and the Master Builders' Association. The former, he understood, was the only incorporated body of builders in this country which had been in existence a considerable number of years. All he could say was that between these two bodies surely the building trade must be well organised.

Mr. Alex. B. Stenning, F.R.I.B.A., F.S.I. (President of the Surveyors' Institution), who replied on behalf of the Surveyors, said he was an old practising architect and surveyor, and in his young days there was not the division between the two occupations which exists at the present time. In regard to the Bill introduced by the L.C.C. on the question of reinforced concrete construction, Mr. Stenning expressed his satisfaction at the result of the combined action of the Institution of Civil Engineers, the Surveyors' Institution, and the Royal Institute of British Architects, which, he said, had the effect of bringing the L.C.C. to a proper state of mind, and after a great deal of time and money had been wasted, amendments were inserted in the Bill which prevented the measure, which would not do much good, at least, from doing any harm so far as London was concerned.

Mr. G. E. Bond, J.P., President of the Society of Architects, next proposed the toast of the evening: "The Institute of Builders and its President." Every member, he said, of the Society to which he belonged, depended upon the hearty, honest, and intelligent co-operation of the builder for the success of his designs and his efforts to provide clients with the buildings they desired, constructionally sound, and at a reasonable cost.

The President in replying, thanked them for their cordiality. The Institute had for its field the whole interests of the building trade, with one exception, and that was the employers' relations with workmen. In regard to this, Mr. Bond had been slightly mistaken in his allusion to the work of the Institute. It was the only Society which was incorporated and which could intervene in any Government measure affecting the building trade, and give evidence before committees of enquiry, etc. Its work could be divided into four divisions, that was to say, work in connection with Parliamentary matters, work in connection with architects, etc., work in connection with municipal acts, and educational work. He had been looking over the agenda paper of the Institute during the last ten years, and he was startled at its manifold activities. The Institute worked in an unostentatious manner, without advertising itself in any way, and among the various things they had had before them were plumbers' registration, extraordinary traffic, workmen's compensation, Employers' Liability Act, Water Board charges, prevention of corruption in building, and labour exchanges. Of late years Parliament had been exceptionally busy on the side of workmen, and it had therefore been the great endeavour of the Institute to put before the Government the employers' interests, and he was bound to say that they had always found the State officials most willing to learn their views on any matter affecting the trade, and those views had been put forward with marked success. They had several gentlemen of great ability upon the Council, for instance, there were Mr. Shepherd and Mr. Frank May; the latter, he was sorry to say, was not present that evening; there were also Messrs. Greenwood and Holloway, gentlemen of the greatest experience and wide views, and whose opinions were received by the State officials with the respect they deserved. With regard to their Parliamentary work, the builders of the country owed the Institute a great debt of gratitude for the trouble it had taken and the expense it incurred in opposing the Bill which had already been mentioned, and in connection with municipal matters they had had a large amount of correspondence, etc., with various municipalities, including also the L.C.C., in reference to the question of scaffolding regulations. They had also appointed witnesses to give evidence before various royal commissions dealing with factories and other matters, which had they not intervened might easily have been led to formulate rules which would have been disastrous to the building industry The *magnum opus* of the Institute had been achieved in the completion of the long debated form of contract which was now working with unqualified success. It was true they had been a little alarmed at the obtuseness of one of H.M. judges being unable to read the English language, and they had been asked to amend clause 30, but he was glad to say that a form had been agreed upon between the Institute and the architects and themselves, which would solve the difficulty. There were many industrial matters which had also been satisfactorily dealt with, and they had also made some steps in the direction of maintaining friendly relations with foreign contractors. Quite a number of Belgian contractors came over to England, and great cordiality was manifested. If such excellent relations continued they would be able in the future to feel that when they were abroad they could call upon the foreign contractor and look upon him as a brother. (Laughter, and cries of "hear, hear.") Referring to the educational side of the Institute's work, Mr. Wallis said its progress was not quite so great as could be wished, but in this direction their efforts were somewhat limited. In conclusion, he urged upon all those present to use their best endeavours to increase the membership of the Institute, and expressed his appreciation of the great assistance rendered by the secretary, Mr. Costigan, who, he said, had the interests of the Institute entirely at heart.

Mr. James S. Gibson, F.R.I.B.A., proposed the toast of "The National Federation of Building Trade Employers of Great Britain and Ireland," and, in doing so, he urged upon builders and surveyors to make the best of conditions of work as they found them. The energies of the National Federation should be concentrated on those qualities which would tend towards good building, good workmen, and success in the art of architecture, as well as the art of building. A great deal could and ought to be done in the matter of the education of the workmen, because it was only by providing good workmen that they could hope to get good work. There were spheres which were open to them all as builders, and men of influence in municipal life and in social and political life, and he was certain that as opportunities arose they would do their best to help architects to regain, if not the full height of their former standing and prestige, at least some position of influence by which these qualities might be of some assistance and value in these modern times. For instance, he would mention the question of the regulation of the traffic in the city of London. Not one architect was invited to sit upon the commission appointed to consider that question, and none of the evidence had been placed before his Institute upon the matter. The commission had not even asked the opinion of the R.I.B.A. upon one of the largest, finest, and grandest architectural opportunities which could arise in the history of this country. (Hear, hear.) He wanted the builders to impress upon members of Parliament with whom they were acquainted, the advisability when projects such as the one he had mentioned came up for discussion, that the opinion of the architect should be asked, and a seat found for him at the table, so that he could make the necessary notes and perhaps ask some of the more important questions. The toast, coupled with the name of Mr. Ernest J. Brown, President of the National Federation, was warmly accorded.

Mr. Brown, in reply, said that in the past the builders of London were apt to look with a cold eye upon the National Federation, but their hearts were now warming to it and they were ready to assist the Association in its objects. The Federation was growing not only in numbers, but in its financial power, which was a great necessity in an Association of employers such as those connected with the building trade. He was sorry to say that there were still many most important builders in the country who still stood aloof from such organisations as theirs, and he only hoped that one day they would see the error of their ways. It was a matter of regret and shame to see such builders reap all the benefit sustained through a federation, yet doing nothing for either their efforts or their purses, to assist in its work. Their work was as important, he ventured to say, as the work of the London master builders and architects combined, for they were engaged in looking after the interests of builders throughout the whole of the country. Their work was growing in importance and so much so, that they were beginning to be recognised as a power in the land.

On the proposition of Mr. Fredk. Higgs, the toast of "The Visitors" was honoured with enthusiasm, and Mr. H. J. Treadwell, F.S.I., replied.

The proceedings terminated with the singing of the National Anthem.

NON-PROVISION OF QUANTITIES: IMPORTANT MOVEMENT.

A conference, convened by the President of the Quantity Surveyors' Association, to consider the question of the non-provision of quantities by building owners when inviting tenders from contractors, was held at the Holborn Restaurant on October 13th, at which the following were present: Messrs. W. F. Wallis, W. Shepherd, E. J. Strange and J. Randall, representing the Institute of Builders; Messrs. E. J. Brown (London), S. Smethurst, J.P. (Oldham), J. Wright (Nottingham), J. W. White (Sunderland), W. Thomas (Cardiff), F. Higgs (London), and A. G. White (secretary), representing the National Federation of Building Trades Employers; Messrs. F. G. Rice, F. May, J.P., B. I. Greenwood and G. Bird Godson, representing the London Master Builders' Association; Messrs. H. T. A. Chidgey (president), Walter Lawrance, F.S.I., A. J. Gate, F.S.I., S. Chatfeild Clarke, F.S.I., T. E. Bare, T. J. Carless, H. Raven, H. Riley, S. A. Stanger, F.S.I., S. G. Thacker, E. Ware (Liverpool), and A. G. Cross, F.S.I. (honorary secretary), representing the Quantity Surveyors' Association.

A very interesting and exhaustive discussion ensued, in the course of which the methods adopted by the Northern branches of the National Federation for dealing with this grievance were fully explained, and met with much approbation.

Messrs. Brown, Wallis, Rice, Smethurst, White, Wright, Shepherd, May, Randall, Lawrance, Chatfeild Clarke, Higgs, Godson, Greenwood, Gate, Carless, and others, took part in the debate, which lasted for upwards of two hours, and the following resolutions were unanimously passed:—

(1) "That the conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities prepared by a fully qualified quantity surveyor being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost £500 and upwards.

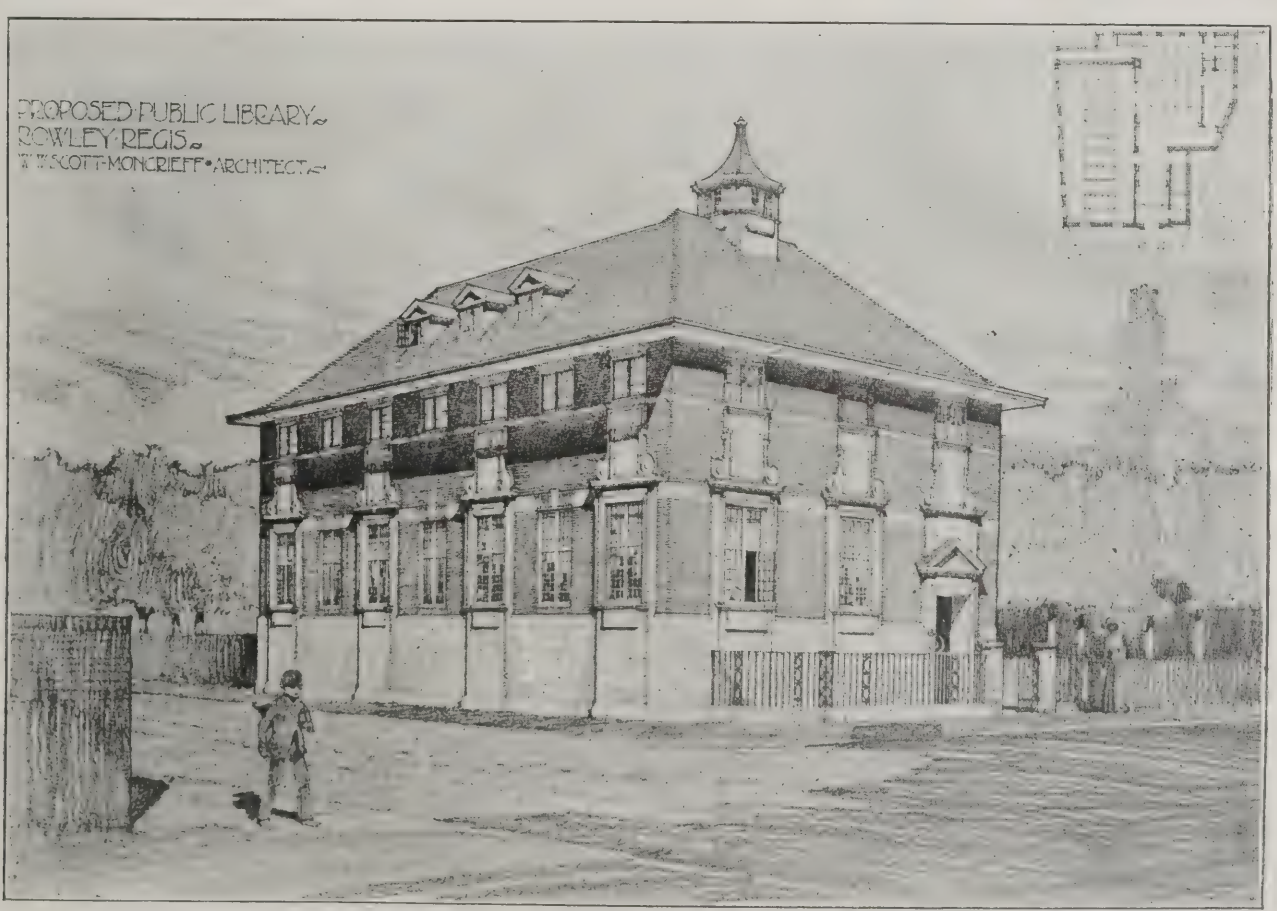
(2) "That the conference recommends the Councils of the Institute of Builders, the London Master Builders' Association and of the National Federation of Building Trades Employers to urge their members to refuse to tender in competition without quantities for works costing £500 and upwards.

The subject is dealt with in our leading columns.

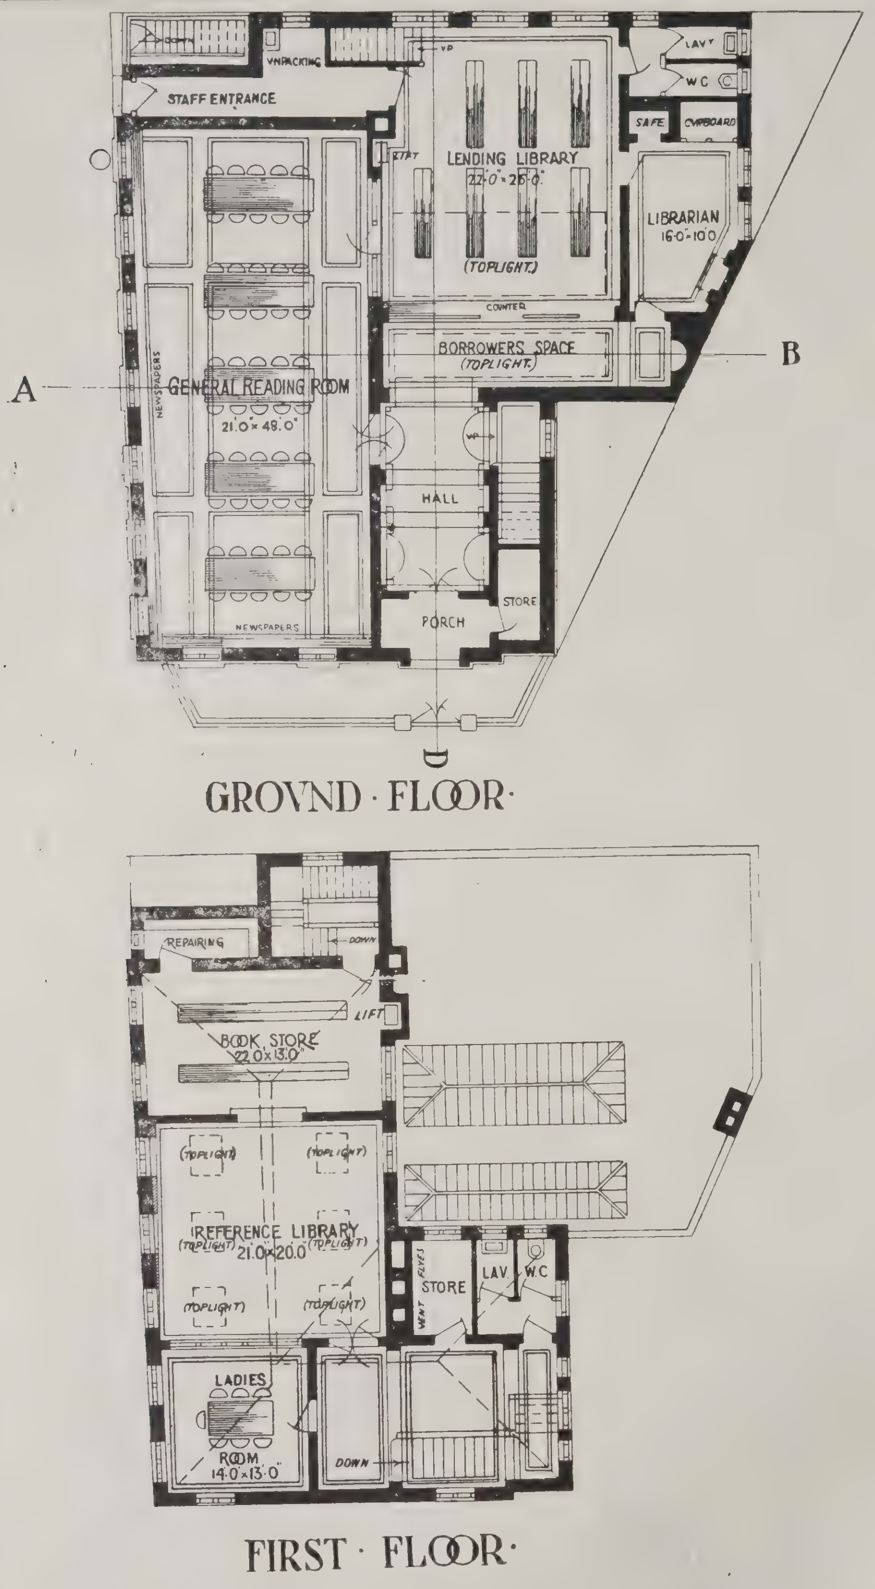
Law Case.

Important Dry-Rot Question.

In the High Court of Justice, before Mr. Justice Grantham and a special jury, Mr. Claude Frederick Shoolbred, a chartered accountant, brought an action against Mr. J. W. Wyles and Mr. A. Migotti, architects, and Messrs. Mitchell Brothers, builders, of Guildford, to recover damages for alleged negligence and breach of duty in carrying out alterations at the plaintiff's house, Greenstead Hall, Essex. Mr. J. R. Atkin, K.C., and Mr. Valentine Ball appeared for the plaintiff; Mr. Marshall Hall, K.C., and Mr. R. E. Moore for the defendants. Mr. Atkin said that in 1906 the plaintiff appointed Messrs. Wyles and Migotti architects of the work to be carried out by the defendants Mitchell Brothers at Greenstead Hall. The plaintiff wished steps to be taken to deaden sound between a sitting-room on the ground floor and a nursery overhead. Lime-pugging was used for the purpose. In May, 1908, after the plaintiff had been residing in the house for nearly a year, it was discovered that the whole floor under the nursery was affected with dry-rot. The floor had to be removed and replaced at a cost of £120, and plaintiff also lost the use of the house while it was being done. He would call evidence to show that the dry-rot was due to the lime-pugging being put in wet, and being given insufficient time to dry before the floor boards were laid. The fact that the floor boards were grooved and tongued, and that there was no ventilation underneath, made it all-important to see that the pugging was properly laid.—The defence by the architects was that they were not consulted about the pugging at all, and did not know of its existence until the dry-rot was discovered. It was also contended on their part that dry-rot was solely due to the fact that linoleum had been put down immediately after the floors were laid.—The builders, on the other hand, said that the plaintiff himself ordered their foreman to use pugging; that the floor was not laid until three months after, when the pugging was dry. The jury, upon the evidence, would have to say whether there had been negligence. Evidence was called that the pugging was put in early in 1907, and the floor was laid three weeks later. The plaintiff also stated that he did not give the order for pugging.—Mr. Chatfeild Clarke, F.R.I.B.A., and Mr. Saunders, A.R.I.B.A., stated that the dry-rot was due to improper ventilation. Ventilation was especially necessary where a floor was tongued and grooved.—For the defence, Mr. Wyles said that he had had 15 years' experience. He never knew of the pugging till he heard of the dry-rot. He did not approve of it, and, if put in, the place should have been ventilated. The trouble, however, was due to the linoleum.—Mr. Ogden, F.R.I.B.A., said that while moisture induced dry-rot, the spores of the fungus were in every piece of cut timber. In his view the dry-rot was caused by the linoleum.—Mr. Migotti said that he did



This design was submitted for the competition held last year. It is planned with two floors in order to give a more dignified building than one with a single storey. The reading room and staircase are placed near the entrance so that the borrowers' space beyond might be free from disturbance. The Librarian's room is in communication with both the public and lending library. The book lift is near the back entrance, and serves to connect reference room and store above with the lending library. On the first floor is the ladies' room and lavatory, also the reference room, book store and repairing room. Extreme simplicity of treatment gives the character of the elevations, which were to have been of thin red bricks and Portland stone, with a tile roof. The windows would have had iron casements and leaded lights.



DESIGN FOR A PUBLIC LIBRARY, ROWLEY REGIS. W. W. SCOTT-MONCRIEFF, ARCHITECT.

not think the dry-rot was due to any negligence on the part of Messrs. Mitchell Brothers, but was caused by putting down the linoleum and stopping the current of air through.—The foreman of the work said that the flooring was put in three months after the pugging was put in. He had not considered the question of ventilation. The architects did not authorise the putting in of the pugging, and he did not mention it to them.—His Lordship, in reviewing the evidence, after Mr. Atkins had briefly replied, said that it was three years since the matters connected with the dispute arose; plaintiff and defendants could not well remember in detail everything that then occurred. After such a lapse of time it was only natural mistakes would be made. It was remarkable that scarcely two witnesses on the defendant's side had agreed. The question was whether or not negligence had been proved against either of the defendants or both of them. His Lordship next pointed out that some of the defendants' witnesses said ventilation was necessary, while others said it was not; when expert witnesses talked in that way, then the jury must use their common sense. Everyone knew that one of the causes of dry-rot was dampness without ventilation. Was not that the case in the present instance?—The jury returned a verdict for the plaintiff, saying the architects were only guilty of negligence in a minor degree. £165 damages were awarded, and his Lordship gave judgment for that amount, refusing stay of execution.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea. Deposit returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Oct. 31.	PEMBROKESHIRE SMALL HOLDINGS: Model plan and specification for a farmhouse and outbuildings suitable for a holding of 50 acres, and at a cost of £400 or thereabouts. The following are some of the conditions: (1) The selection of the plan and specification to be adopted shall rest solely with the Council. (2) The Council will be prepared to pay a sum of £5 5s. for the selected plan and specification, which are then to become the absolute property of the Council. (3) If the Council are of opinion that none of the plans are suitable for their purpose they shall not be obliged to make any selection. Plans and specifications to Marshall George, Clerk and Agent, Pembrokeshire Small Holdings and Allotments Committee, Haverfordwest.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30. and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: one guinea.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Jan. 31, 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.

A writ has been served on Cardiff City Council with respect to a claim by Mr. Edward Seward for architectural services. The circumstances of the claim are already familiar to our readers, and, pending the settlement of the action, we refrain from further comment.

BUILDING TRADE ORGANISATION IN FRANCE.*

By A. G. White.

On the occasion of my visit to Paris in November, 1908, to attend the International Congress of Building Contractors, I obtained from the General Secretary of the master masons of Paris a number of publications bearing upon the above question. These I have perused, and I propose to shortly review the information they contain so as to convey to you some idea of how the French builders are organised and what sort of questions and conditions they have to face.

In France both builders and public works contractors have deemed their interests sufficiently identical to warrant their forming part of a common organisation known as the French Federation of Building and Public Works Contractors.

According to its President, this Federation consists of:—

28 Syndicates (or local Associations), with a total of 5,400 members forming the Central Federation.

35 Syndicates (or local Associations), with a total of 4,000 members forming the N.-West Federation.

38 Syndicates (or local Associations), with a total of 3,500 members forming the N.-East Federation.

44 Syndicates (or local Associations), with a total of 2,500 members forming the S.-West Federation.

30 Syndicates (or local Associations), with a total of 3,500 members forming the S.-East Federation.

16 Syndicates (or local Associations), with a total of 1,250 members forming the Northern Federation. Total Syndicates, 208; total membership, 20,150.

The value of the work done by the members of this body yearly is estimated at about 2 milliards of francs. The rules of these regional federations accord with one another and taken together they constitute the National Federation.

At their first Congress in Bordeaux, in 1907, there assembled about 800 delegates, representing 108 syndicates.

New Federations may not be admitted to the National Federation unless they have a membership of at least 1,000, and they must pay an entrance fee of 250 francs.

The subscription to the National Federation is 50 centimes per member per year with a minimum of 500 francs for any Federation. On a membership of 20,150, this gives the French National Federation a revenue of £420 a year nearly.

The subscription of a centre in England, paying the maximum subscription works out at about 2s. per member on existing membership, but on a membership as proportionately large as that of the French Federation, this rate would be considerably reduced, possibly to 1s. or even 6d. per member.

The Executive Council of the French Federation numbers 42 members, 7 from each regional federation, large or small. The Executive Council meets once a year, it is elected for 3 years and 1-3rd of its members retire yearly.

Its Administrative Committee (termed in France, the Bureau), consists of 15 members, each regional federation being represented by a V.P. and a secretary, and the rest by the officers of the National Federation.

The Bureau meets twice a year unless called specially. At other times the President has full powers to represent the Bureau.

It will be observed that the system of representation is scarcely so democratic as that in force in the English Federation and the meetings do not take place so often as with us.

The National Federation in France is a comparatively new organisation, as are most of their other organisations.

The regional federations are composed of subsidiary local associations termed syndicates, and of groups of such syndicates.

The following remarks refer to the Paris and Seine district.

Each branch trade has its own local association or syndicate, of which the Master Masons' Association of Paris may be taken as a type.

Bricklayers also come under the term masons in France.

This association is a syndicate formed for a period of 25 years from January, 1908, but the original association appears to date from 1810, in addition to the usual objects of association with which we are familiar, I note the following, which are somewhat exceptional.

5. To study and to propose all possible improvements in the art of building.

7. To give advice in affairs which may be remitted to the association by the tribunals and to settle as a friendly composer of differences and in conformity with the law, any contestations relative to the industry it represents which may be remitted to it by members or even by third parties.

8. To create libraries, professional courses of instruction for workmen or employees, employment bureaux, etc.

9. To establish schedules of prices with sub-details as to materials and labour.

10. To see that each member of the syndicate observes vis-a-vis with his colleagues all the rules of a courteous and loyal competition.

11. To repress by its influence all failures to observe the said objects.

The syndicate has power to acquire accommodation for its meetings, libraries and professional courses, also to create among its members special benefit funds for mutual help and for retirement pensions. Members must be duly recognised contractors in full enjoyment of all civil rights and be introduced by two members. Newly elected members are expected to attend the next meeting after election in order to be presented to their colleagues.

The rate of subscription is not given in the rules, it is determined by the Council each year.

The organisation consists of a general assembly, and an Executive Council of 42 members elected for three years, 1-3rd retiring annually.

No member of Council may serve more than two successive terms without one years' interval, and a Bureau or Administrative Committee of seven members, all officers, reelected each year, members of Bureau may serve three terms, then one years' interval must elapse.

Meetings are held monthly, the Bureau meets one hour before Executive Council.

The President is the legal representative of the syndicate.

A Budget is prepared annually, the Budget proposals once adopted must not be exceeded. Supplementary credits must first be voted.

Attendance at meetings is required. Councillors missing four successive meetings without having excused themselves may be deemed to have resigned, and the matter shall be considered at the fifth meeting.

Councillors are subject to a fine of three francs for each non-attendance at Council or Bureau.

The only cases for exemption are: Jury call, military service, illness, public service or leave duly obtained.

A committee of discipline is elected annually by the E.C.; it consists of the President and two members of Council.

It has to consider all infractions of the rules or resolutions of general meeting, penalties inflictable are: Reprimand, fine, temporary suspension, permanent suspension. Fines may not be restored.

The capital of the syndicate consist of: Excess of receipts over expenditure; gifts or legacies.

At dissolution of syndicate, funds are equally divisible among their membership.

The Council at its discretion may give annually medals to deserving workmen or pupils.

Grouped Associations.

At Paris the various associations appertaining to the different trades are grouped together for certain purposes of common action.

Term of group, 17 years.

They have a common headquarters consisting of meeting rooms and offices.

Each society pay 100 francs subscription yearly. Ten per cent. of this is placed to reserve, the balance applied to revenue. Should the expenses exceed this revenue the societies contribute the shortage proportionately.

Each society forming part of the group must be a properly constituted syndicate. Each syndicate retains entire autonomy and conserves its own archives.

Membership of the group entitles each syndicate to use the headquarters accommodation for meetings of every kind. All necessary clerical and accounting work is provided for them, all minutes are kept for them and copies furnished if required. All archives, books or other things constituting the library of each syndicate is classified and taken charge of for them; in fact, everything done for the good conduct of the business of each syndicate.

Special work other than that covered by the usual routine when required by any syndicate has to be separately paid for, such as work connected with professional courses, fetes, balls, banquets, etc. The reserve fund is used to construct or provide a habitation for the groups, works useful to industry, allocations to such works. The administration is in the hands of a Council composed of the Presidents of the respective syndicates, with one delegate for each syndicate having a membership of less than 100 members and those of over 100 members are entitled to two delegates.

It meets four times a year.

Resolutions affecting the general interest must secure a 2-3rd majority to become effective.

The Council manages the general business relating to funds, headquarters, salaries, etc.

The Bureau consists of a president, three vice-presidents, a treasurer, and three secretaries.

The Bureau manages business as to:—

Centralising information on questions of general interest.

Obtaining advice from syndicates on specific points for the use of the permanent commission for studying questions.

Submitting new questions to the respective syndicates.

Organising action in common, such as petitions, re-unions, delegations, etc.

Studying all litigious or contentious questions affecting the association or referred by its members.

Executing all decisions of the Council and acting as an Emergency Committee.

Determining the recompenses to be awarded to workmen and pupils.

Generally doing everything to facilitate the functions of the professional courses.

The Bureau meets monthly or oftener if required.

The President represents the group in its corporate capacity.

Commissions of Study.

The delegates of the Syndicated Chambers are divided into three sections, called as above, presided over successively by each of the vice-presidents.

Their mission is to study questions of interest to the associated industries either when remitted to them by the Bureau or on their own initiative.

They draw up reports to the Bureau on the questions considered.

Publications.

A periodical publication is made of all reports, resolutions, minutes, and notices emanating from the Council or from the syndicates.

Similarly all communications of general interest, extracts of legal decisions, matters of jurisprudence or of technical controversy are published.

---

*A Paper read before the Conference of Secretaries of the National Federation at Leeds yesterday.

Also any information and any publicity likely to benefit the group or its members.

Each syndicate has a right to a publication of extracts of its own proceedings, and is allottted six pages a year; extra pages may be had, however, by payment.

To provide for the cost of this publication, each syndicate has to pay an annual sum ascertained at each year end for each of its members.

In addition, there are the extra sums due for extra insertions.

Any further sum is paid by the general fund of the group.

Recompenses for Workmen and Others.

A medal of silver with diploma is awarded annually as a prize to recompense the probity, intelligence and devotion of foremen, or workmen having at least 10 years consecutive service with the same employer.

Four chambers in rota present a candidate each year.

Medals in silver and bronze are also awarded to distinguished pupils in the professional courses.

Individual syndicates may also award medals if they choose.

The grouped associations of Paris and the centre of France form a regional Federation under the title of the Central Federation of Syndicated Chambers of the Building Industry and of Public Works.

The rules offer no features specially different from those already commented on.

Among the objects of the Federation is given the following: "To group all the desiderata and draw up a common programme of economic demands which shall become the common policy of all the Syndicated Chambers in the Federation, and thus give to the directing committee more authority and weight in the defence of the corporate interests and in the execution of the decisions of the Federation."

The annual contribution per member from each syndicate is fixed at one franc, modifiable by general meeting yearly. Committee have power to vary it, however, in exceptional cases.

With its membership of 5,400, this gives a revenue of only £225 a year.

The following will give some idea of the work done by the foregoing organisations.

On the 20th December, 1908, at Paris, the 25th distribution of recompenses to workmen and employees took place, presided over by a Government representative, when 153 prizes or medals of honour were presented in the various grades, a banquet followed.

M. Soulé, in the course of his address, mentioned that the following works of a social character had been initiated and carried on by their organisation.

1. The creation of recompenses to meritorious workmen.

2. Mutual Insurance Societies created prior to the law of 1898 as to workmen's compensation, for the aid of injured workmen and their dependants

After the law of 1898, these were transformed into the General Guarantee Syndicate for Building and Public Works, and the General Association for Industry and Building Insurance.

3. Twelve courses of instruction in the building profession, absolutely free for workmen or employees of the syndicates of carpentry, joinery, roof covering, plumbing, masonry, locksmithing, carriage work and carpet work. These courses are subventioned by the State. They are followed each year by more than 150 pupils.

4. An employment office, quite free of charge, which during the year has found work for 936 employees and workmen.

5. Arbitration Commissions which have had remitted to them by the Tribunal of Commerce during 1908, 887 cases of which 143 are still under consideration and of the remaining 740 cases, 450 have been settled by conciliation, equal to 60 per cent.

6. A Judiciary Council of the Federation (central), consisting of a re-union of jurisconsults, experienced in business cases, especially as regards the building industry. This Council is at the disposal of members and local Chambers for the legal consideration of questions affecting the industry.

7. The service for contentious cases, which defends the interests of our adherents in their personal cases on the most economical lines as regards legal expenses.

8. The library of the syndicate, containing 4,000 volumes and added to each year with special works relating to building.

9. Two publications, one weekly the other monthly.

These inform the membership of the whole Federation as to all reports on questions under consideration.

The above 9 heads relate more especially to the region of Paris and the departments of Seine et Oise forming the Central Federation.

Apprentices' Competition.

As a further example of what is being done, the following is taken from an announcement in the Official Journal re above. Competition by the joiners' or cabinet-makers' section, organised by the Syndicate Chamber for 1909.

1. Reserved for young people under 15 years of age.

2. For young joiners not yet through their military service.

The first consists of an eliminatory test consisting in the execution of two different pieces of joiners' work set by the committee to be sent in before 15th February, 1909.

The second consists of a final test for honours in which only those admitted by the classifying commission may take part, consisting in a work in joinery to be executed in 10 hours on a Sunday, in a workshop to be designated.

The usual types of builders' associations in France have now been briefly described. There is, however, an exceptional type of association existing at Paris which has been formed to deal with certain special exigencies.

It is called the Professional Association of Masonry Contractors of Paris and Seine, and is a limited liability company, with a nominal capital of 186,100 francs. Only masonry contractors of the above districts are eligible as members.

The general object of this company is to give the members of the trade a corporate quality not possessed by the ordinary syndicate or association, and so enable the trade to negotiate as a whole for supplies of materials, etc., etc., on the best wholesale terms.

As this represents a new departure in builders' organisations, I shall give somewhat full particulars of its constitution.

Objects.

1. To serve as intermediary between its shareholders and those who furnish materials and plant employed in construction.

2. To serve as intermediary between its shareholders and the workmen's unions by entering into agreements with them as to wages, hours, etc.

3. To acquire or rent, with or without undertaking to sell, properties situated in France, susceptible of being exploited for the building industry.

4. To let, exploit or sell such properties.

5. To acquire any commercial undertaking of a contractor for masonry with power to retrocede it, in whole or part, to members of the company or to third parties.

6. Finally to take all useful measures for safeguarding the interests of the industry and those adherent; to seek out and execute all improvements presenting economic advantages, profitable alike to contractors and their clients.

The company under objects 1 and 2 acts solely as intermediary, and undertakes no responsibility for the solvency of those who resort to its mediation. Neither does it assume any responsibility towards the latter for either the quality or quantity of the merchandise delivered by the merchants and dealers. nor for delays in delivering or failure to carry out the conditions of the sale.

The members must act directly against the merchants.

The society is formed for a period of 20 years.

The shares are of the value of £100 each. Allotment takes place on a minimum subscription of 20 shares.

If subscriptions exceed the nominal capital, subscribers receive in proportion to the average amount of work executed by each during the preceding 5 years.

The average is ascertained by doubling the average wages paid to workmen during the said period.

One-fourth only of the subscribed capital is called up.

The share certificates are held by the company as a guarantee of the execution of engagements entered into.

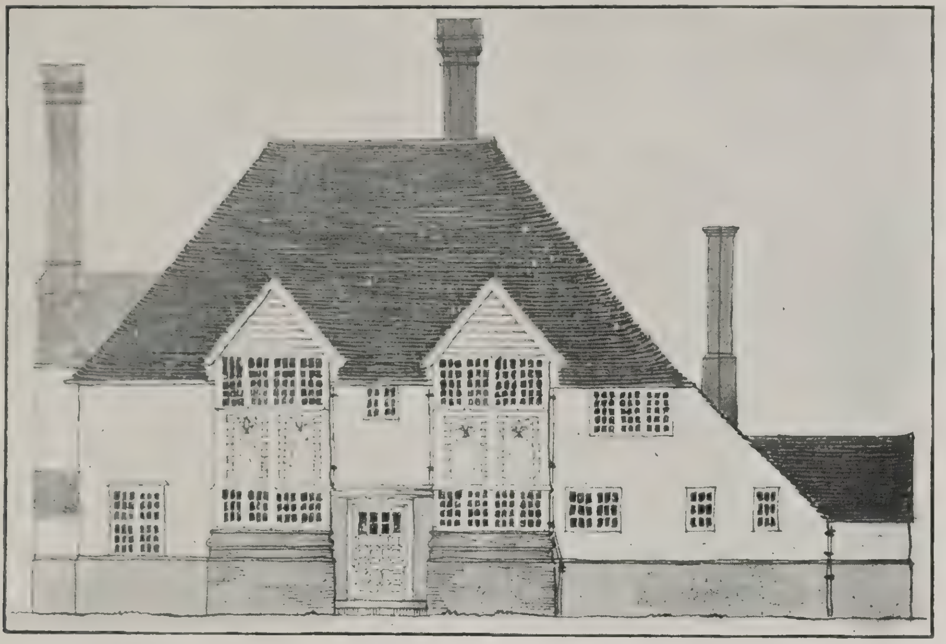
This house is built with a brick base, rough-casted above and roofed with red tiles. Decorative panels in brick and flint, with weather-boarding above, are shown on the front bays.



DETACHED HOUSE NEAR WOODHAM FERRIS, ESSEX. ENTRANCE FRONT.
JOHN W. RHODES, ARCHITECT.

Transfers require the sanction of the Council except where a shareholder transfers them to the purchaser of his business.

The possession of shares implies adhesion to the articles of association and to all decisions of the general meeting, and any regulations governing the internal affairs of the company.

Admission to membership requires the sanction of the Council, but right of appeal to a general meeting exists in case the application is refused.

Those who join the company after its formation must pay on the amount of their shares.

1. A sum equal to that paid by the original subscribers.

2. A sum representing the proportion in the reserve fund appertaining to each share whatever such proportion may be at the time of joining.

Any shareholder has the right to resign membership.

Shareholders becoming defaulters, either as to production of accounts, or as to payment of dues, or other sums, shall be notified by the Council. If they do not remedy their default within a prescribed time or fail to make a valid excuse, they may be proceeded against by law, or expelled the company by a vote of the general meeting.

If a shareholder retires, voluntarily or otherwise, the company will return to him, within a defined time, and after he has cleared himself of all obligations to the company, his original subscription and his share of the reserve fund after deduction of his share of any losses of capital or reserve incurred up to that time. The sum to be repaid bears interest until repaid. The shareholder who retires, remains responsible for five years towards his co-shareholders for all debts or engagements of the company contracted prior to his resignation, not exceeding, however, the total of his shares.

A directorate of 9 to 12 members elected for three years and renewable 1-3rd each year forms the Council of the company, qualification for director, 30 shares.

These shares are held as a guarantee for his acts during his directorship, and may not be sold during that time.

A managing director at a fixed remuneration may be appointed by the Council.

Directors' fees are fixed by the general meeting.

25 per cent. of the net profit is set aside as follows:—

5 per cent. to constitute a reserve fnud.

20 per cent. to constitute a provident fund.

The remainder of the net profit is divided among the shareholders according to their holdings.

When the 5 per cent. aforesaid has resulted in a reserve fund equal to 1-10th of the capital, the earmarking of that amount for reserve fund ceases to be obligatory, and the whole 25 per cent. may go to the provident fund.

When the society expires, and after it has liquidated its engagements, both the aforesaid funds are divisible among the then existing shares. Provision is made for winding up if 3-4ths of the capital is lost.

The reasons which led to the formation of this association are the following; I quote from an official circular:—

"Since the year 1905 the demands of the workmen engaged in the building trade have been incessant."

"It is admitted that: 'There are certain new conditions such as the law requiring a weekly rest-day, the limitation of the hours of work by law, and the increased cost of living, which in part justify their demands, but it must also be admitted that employers have always tried to satisfy all legitimate claims.'

"Led, however, by the groups which they represent, the workers have made unreasonable demands, and not content with reducing their output to an intolerable extent, have accentuated their revolutionary attitude by successive strikes, the blacklisting of employers and the deliberate spoiling of work, material and plant."

To this the employers opposed a lock-out, which lasted 15 days, when the workmen came in on the employers' terms, which included an increase of wages. The spirit of revolt, however, seems to permanently subsist. A number of press extracts are given in proof of this, wherein the workers advise their members to carry on a passive strike by working, but doing as little as possible all the time, and by refusing to work any labour-saving machinery.

The "ca-canny" spirit is carried to great excess, no consideration is given to the general interest of the community, solely the workmen are advised to on no account produce one more than another, and not to do any task or piece-work, if they do they are mulcted by their society and deprived of any pecuniary advantage gained.

The workmen look to boycotting, the labour label, and to sabotage as their weapons for securing their objects and openly advocate these methods in their official press.

They thus define these three proceedings: Boycotting is blacklisting an employer, merchant or retailer, workmen are required not to work for such and not to consume their products. Sabotage is putting into practice the maxim, "For bad pay give bad work." It is effected sometimes by reducing output, sometimes by destructiveness, sometimes by wasting stock or materials or giving overweight to purchasers, or by rebuffing clients so that they are offended and go elsewhere. Sabotage is carried on by individuals chiefly. It is boasted that the mere threat of it generally suffices to cow an employer. The Parisian hairdressers daubed the shop fronts of their employers with a caustic substance which destroyed the paintwork, and by this means gained their object. During three years, out of 2,000 hairdressers' shops in Paris, barely 100 escaped being treated in this way at least once, and to many it was done several times.

(*To be concluded.*)

LIVERPOOL MASTER BUILDER'S YEAR-BOOK.

The Liverpool Master Builders' Association Year-Book (October, 1909, to September, 1910), is published with the object of providing useful information for those actively engaged or interested in building operations throughout the Liverpool area. Its circulation is not confined to members of the association, but is extended to the principal persons interested in the building trades of Liverpool, such as architects, officials of the various public bodies, etc. It contains a variety of useful information, including the forty-third annual report of the association; forms of contract, apprenticeship indentures, etc.; wages lists; lists of officials and members of the association; extracts from working rules. In a brief historical sketch, it is stated that the association was founded in 1866, with Mr. S. H. Holme as first president. In 1867, the association was instrumental in initiating the form of contract afterwards agreed upon by the Royal Institute of British Architects. The present number of members is 398; and its success is attributed to the fact that on its council there is equality of representation, every branch of the trade having an equal number of representatives.

From the forty-third annual report, which is published in full in the Year-Book, we make the following extracts:—

Several minor complaints by the operative joiners have been dealt with by the committee during the year. The operatives have made a claim against a member for "insulation money" where no insulation material was being used by the firm at the time, the operatives in their letter claiming that all joiners' work at, or for, a cold storage, whether insulation material is being used or not, comes under the rule, and the men are entitled to sixpence per day extra. The employers met the operatives under Rule 17 (Board of Conciliation), but were unable to come to a settlement. It was then referred to the local Conciliation Board, who also failed to agree, and the matter has now been referred to the Northern Centre Conciliation Board.

The operative masons approached the association with a view to some arrangement being arrived at whereby "worked stone" should be prohibited from coming into Liverpool from towns where wages are paid at a lower rate than here. The employers' committee fully discussed the matter, and communicated to the operatives that as there is such a strong feeling amongst the employers against any "worked stone" rule, it would be useless to discuss the matter further.

The operative masons have approached this association with a view to an alteration in leaving off time on Saturdays from 12.30 to 12 o'clock, and the Council and committee have intimated that this association will consent to the alteration being made, provided the bricklayers and joiners also agree to adopt the same leaving off time. The joiners have not yet signified their approval, but should they do so notice will be sent as to when the change is to come into force.

Six months' notice, expiring May 1st, was given to the operative bricklayers, for a decrease in wages of three-farthings per hour; the working hours to be 47 per week for the summer months, 44½ during November and February, and 42 during December and January. All rules, except those relating to wages, hours, and starting times, to be expunged. A counter-notice was received from the bricklayers for an increase in wages of one penny farthing per hour, with extra lodging money, double time for all overtime, limitation of apprentices, etc., leaving the hours of work and all other rules as before. A conference was held with operatives in April last, when the matter was referred to the Local Conciliation Board, who came to no settlement. The matter had, therefore, to go before the Northern Centre Conciliation Board, who decided that the hours of work should be as in the employers' notice; the wages to be increased one farthing per hour; rules relating to meal hours and starting times to be altered according to the new hours; and all other rules to remain the same. The rules are not signed yet, owing to the question of the 12.30 leaving off time on Saturday being in abeyance, as referred to above. Several complaints have been received that members are not adhering strictly to the rules with regard to the time of starting their men in the morning. As the breaking of rules by employers is bound to lead to unpleasantness with the operatives in the end, the Council trust that all members will strictly adhere to the rules agreed upon.

BUILDER AS LORD MAYOR OF BRISTOL.

To the building trade of Bristol has fallen the honour of providing the prospective Lord Mayor. At the meeting of the City Council on November 9th next, Mr. Christopher Albert Hayes, of Salisbury House, Stoke Bishop, will be proposed for the office. Mr. Hayes was born at Clifton in 1850. He was educated privately, and afterwards apprenticed to his uncle, Mr. J. Hayes, of the firm of Messrs. Hayes and Son, builders and contractors, of Bedminster. After serving his apprenticeship, he went to London, where he held important positions with some of the principal building and contracting firms. Returning to Bristol in 1873, he founded the business now carried on by Messrs. C. A. Hayes and Sons. He has carried out many important contracts in Bristol and elsewhere.

(*Photo.* "*Bristol Observer.*")

Mr. Hayes has been connected with the Bristol Master Builders' Association for many years, and occupied the position of president in 1896.

Owing to the alteration in the bricklayers' hours, the question of what wages should be paid to the labourers was considered by the bricklayers' committee, and also the Council of the association, who recommended that members should pay hod-carriers at the rate of 6½d. per hour, but this rate only to be paid when the men are carrying the hod, and not when hod-carriers are engaged doing ordinary labourers' work. All other labourers to remain as before.

Early in the year the operative painters struck several jobs owing to the men having been taken on at the jobs and the employers refusing to pay walking time and expenses. The employers offered to discuss the matter under Rule 16 (Conciliation Board), but the operatives objected, and the employers then gave the operatives notices that owing to the rules having been broken by them and the conciliation procedure thereunder disregarded by them, no working rules whatever would be recognised as existing between this association and their society. Several conferences subsequently took place, but without any satisfactory conclusion. The employers have offered to submit the rule to arbitration, but this the operatives object to. The Council trust that all members will refuse to pay walking time in cases where the men are taken on the job.

Several interviews have taken place between the employers' committee and the operatives, with regard to encroachment on plumbers' work.

The Corporation Baths Committee have now decided to allow master plumbers to tender with heating engineers for hot and cold water services.

A conference took place in October last between representatives of this association and the water engineer, who agreed that the time had arrived when new regulations should be drawn up, and promised that this should be done, and that before having same finally approved, he would submit a draft to this association for its consideration and suggestions. The water engineer has been recently approached again, and he informs the Council that the matter is receiving his careful attention. It is hoped that the new regulations will be framed shortly.

At the suggestion of Mr. J. B. Johnson, a member of this association, the National Federation decided to go into the question of having the National Agreement with operative plasterers amended. A special joint meeting was appointed of the National Federation of Building Trade Employers and the National Association of Master Plasterers, with the result that a new agreement has been drafted, and the draft was submitted to the Plasterers' Committee of this association, and approved. The joint committee consisted of one master plasterer from each of the four centres, four builders' members of the National Administrative Committee, and four members from the National Association of Master Plasterers. Mr. J. B. Johnson was the member elected to represent the Northern Centre.

With respect to conciliation boards, the Northern Centre asked each association in the Northern area to consider the following two questions:—"(1) Are you in favour of the Northern Centre withdrawing from the scheme? (2) Can you suggest any alterations in the rules which will improve the working of the scheme, and prevent friction arising thereunder?" This association appointed a special committee to go into the matter, and consider same, and forwarded the following resolution in reply:—"That this committee considers the experience of Liverpool under the conciliation scheme has proved unsatisfactory, and we are in favour of withdrawing from the scheme." With regard to the second query, it was decided that there was nothing to suggest. The resolution of Liverpool received very little support at the Northern Centre meeting, with the result that the Conciliation Boards still continue.

The Board of Trade forwarded a memorandum to this association with regard to a court of arbitration that the Board intended forming, and the same was fully discussed, with the result that this association wrote approving of the principle of the scheme, and requesting that some building trade employers should be included in the panels, and also suggesting that any Board appointed to consider a dispute in the building trade should consist, on the employers' side, of gentlemen engaged in the building trade.

In a previous report it was stated that this association had approached the Architectural Society with a view to a sum being inserted in the quantities by architects for the cost of attendance on specialists. This the Architectural Society agreed was reasonable, and recommended their members to carry it into effect. This association, early in the year, again approached the Architectural Society, with a view to their again calling their members' attention to the recommendation, and this was done. Some architects, however, still continue on the old lines, and act contrary to their own society's recommendation, but it is trusted that before long all architects will carry out the suggestion. The committee strongly urge all members to insist upon a lump sum being inserted in all quantities to cover attendance on specialists.

It was resolved at a meeting that it is desirable that an honorary members' committee be formed. A further meeting of honorary members will be called to appoint a special committee of six, to confer with six members of the Council, as to the scope of the proposed committee.

In August last the Belgian builders, to the number of about 100, visited Liverpool, and this association were asked by the Yorkshire Federation (who had invited them to England), to look after the visitors during their one day's stay in Liverpool. The Council drew up a lengthy programme for the Belgians, who thoroughly enjoyed themselves.

Considerable correspondence has taken place between the various committees of the Corporation and this association, as to the large amount of work done by the Works Department, and though no satisfactory conclusion has yet been arrived at, it is thought that the correspondence will result in more work being put out to public competition.

This association has been kept in close touch with Birkenhead and Wallasey through the Mersey Federation, and the bricklayers' rules in Birkenhead have been altered almost entirely in the same manner as the Liverpool rules. The Federation has also been able to render its influence and support in reference to the obtaining of quantities, etc., and making objection to unfair conditions and practices, in cases raised by the federated associations. The Federation is now taking up the question with the Birkenhead Town Clerk, as to the appointment of an independent arbitrator in all Corporation contracts.

Several communications have been addressed to corporate bodies and architects respecting the conditions of contracts and invitations for tenders, etc., especially in reference to tenders being required without quantities being supplied. In certain cases the association intervened successfully.

The attention of the association was called to the practice of quantity surveyors cutting down as much as possible the items in their quantities to the detriment of the builder, and communications were addressed to the Quantity Surveyors' Association, the Liverpool Architectural Society, and the City Surveyor. Favourable replies were received; the City Surveyor stating that he would take up any particular case if the association would specify it. The association is at present in communication with the Quantity Surveyors' Association, London, with a view to obtaining a uniform system of taking out quantities.

The "Builders' Journal and Architectural Engineer" is now the sole official organ of the National Federation. This Journal is, without doubt, a very useful and practical technical Journal, and a certain portion of the paper is devoted each week to Federation news. The council have decided to recommend the members to give this Journal every support, and it is trusted that all members will become subscribers, and so keep in touch with association and Federation matters through this official organ.

Members are reminded that they should insist on all their apprentices attending the evening technical classes, in accordance with their indentures. Afternoon classes are formed for young boys during the first two years of their apprenticeship, who are not eligible, owing to their age, for the evening classes. The time spent at the afternoon class is reckoned by their employers as working time. In this way the boys become interested in their work, and are the more ready to join the evening classes when they become old enough to do so. The Council recommend that all employers should give these afternoon classes their support, by sending their younger apprentices. The Council has decided to place the sum of about £11 per annum at the disposal of the Technical Instruction Committee as a prize fund for the building trade students, and this will be principally awarded to encourage regular attendance.

The Council hope that members will strictly adhere to Rule XIV. B, which is as follows:—"Members shall not give or take tenders for any work to or from any persons who are not members of this or kindred associations connected with the building trade, and shall not employ such persons to do work for them."

Trade and Craft.

Wait's Adjustable Attachments for Rule and Measuring Rod.

Mr. Edwin Wait, of 9, Liverpool Road, Thornton Heath. Surrey, has patented some small and neat attachments for the rule and measuring rod. The attachment shown in Fig. 1 is a clamp that can be used as a gauge by securing it to a rule as shown in Fig. 5, and, accommodating a bradawl as a centre, is serviceable for striking curves or circles as illustrated by Fig. 4. A fine steel point, fitted to the attachment shown in Fig. 2, dispenses with the use of a bradawl, and, when not in use, folds up into the fence, so that the adjustment can be employed as indicated in Fig. 5. Fig. 2 will hold a pencil, drawing pen, or steel point, and is adapted for use with either Fig. 1 or Fig. 2, when the rule is employed as a beam compass or trammel as shown in Fig. 4. These adjustments are well made and finished, and are very cheap. All who have to do with setting out or marking off, or with the ordinary processes of the draughtsmen's office, will welcome these instruments as an efficient substitute for the marking gauge, or as an exceedingly handy and convenient aid to accuracy and neatness in several other operations.

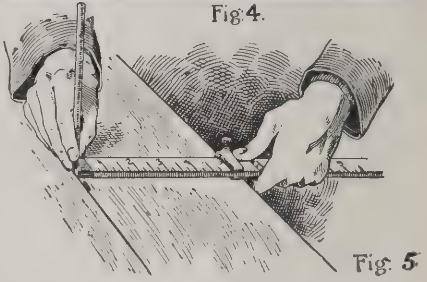

Fig. 5

Twyfords' Sanitary Fittings.

Messrs. Twyfords, Ltd., Cliffe Vale Potteries and Enamelled Fireclay Works, Hanley, have issued "Interim Catalogue E," which illustrates a few of their leading productions in lavatory basins, w.c. basins, etc., which, while based on old and well-known patterns, have been re-designed to meet present-day requirements, by eliminating all mouldings and sharp angles, and substituting plain surfaces and rounded edges. The strength of these basins has been increased, and the risks of shipping are very much reduced, while the curves and plain surfaces facilitate cleanliness, the total result being that the new designs are more attractive, and at the same time represent a considerable improvement from the hygienic standpoint. In addition to the revision of the older patterns, the firm have included several entirely new designs. The most important of these are the pedestal lavatories illustrated on the first few pages of the catalogue, and these embody the new features already mentioned. All the goods in this list are made in the fine white "C.V." ware, which is guaranteed non-crazing, while for purity of colour, evenness of surface, and durability, it is claimed that there is absolutely nothing superior on the market.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Builders' Locked-up Capital.

At the recent meeting of the Administrative Committee, reference was made to the great importance of the question treated of in the articles bearing the above title, which appeared in the Official Journal under dates 1st and 22nd September, when Mr. Smethurst, a representative from the Northern Centre, said this question was attracting so much attention in that district that there was no doubt whatever but that the committee would shortly receive a very strong request for action to be taken against, and a remedy found for, the abuse of credit involved in this question.

Revised Agreement with the N.A.O.P.

The resolution passed by the half-yearly meeting authorising the completion of the above agreement subject to a rider in regard to London, was duly communicated to the N.A.M.P. and N.A.O.P., who respectively signified their adhesion thereto and signed the document, whereupon it was also signed by the President and Secretary of this Federation and dated 1st September, 1909. The new rules are issued, and it will be necessary for the appointment of local joint committees to be proceeded with on similar lines to those existing for the conciliation scheme.

Leasehold Tenure and Building Operations.

Information is desired at Grimsby as to the practice elsewhere in regard to charges for licenses for converting leasehold dwelling houses into business premises. In Grimsby, agents of landowners are enforcing charges for surveyors' and solicitors' services besides increasing the amount of the ground rent.

Organisation.

Correspondence has been initiated, which it is hoped will lead to the formation of a builders' association at Normanton. This has come about through the Official Journal getting into the hands of a builder there, causing him to write for information. Secretaries are requested to note the advantageous use which may be made of the journal in thus enlarging our organisation.

The secretary has received a visit from a builder at Carmarthen who desires to initiate the formation of a local association of builders there. Information had been given and help tendered, and the secretary of the South Wales Federation advised.

Some enquiries from individual builders in the west as to membership have been dealt with, and the County Federation secretary advised.

Collective Purchasing.

The question of collective purchasing of builders' materials is engaging the attention of one of our important local associations, and information on this point has been prepared by the National Secretary and may be availed of by any association.

Winter Meetings.

The following circular has been sent to the county federations:—

24th September, 1909.

ORGANISATION.

Dear Sir,—I shall be glad to hear that your Federation intends to make some endeavour to extend its membership during the coming winter.

Please note that I am available by arrangement to address meetings anywhere, and shall be only too pleased to render to your Federation assistance in this work.

Trusting to hear from you in due course,

Yours faithfully
A. G. White,
Secretary.

International Facilities for Students.

The secretary had recently an application from Paris on behalf of a student of the Special School for Public Works and the Building Trade, who desired to spend his vacation in gaining practical experience on works in this country, and, through the kindness of Mr. Nicholson, was enabled to arrange for his doing so with Messrs. Baldry and Yerburgh, who are engaged on railway construction near Hull. The young man reports having received every courtesy and much valuable instruction through this experience. The secretary has also been spoken to by two of the Belgian builders who lately visited us, who desire their respective sons to spend six months in England next year for a similar purpose, including practice in the language. In each case the suggestion is to give any services they are capable of giving in exchange for the privilege. Apparently there is a willingness to exchange opportunities if there are any builders who desire similar facilities for their sons, and the secretary proposes therefore to communicate with the county federations and through them to the local associations on this subject, and if it appears that there is a disposition to exchange privileges in the manner suggested, will use his good offices to bring them about.

The Northern Centre.

Secretary: James Denver, Cromwell Buildings, Blackfriars Street, Manchester.

Lancashire, Cheshire, and North Wales Federation.

of local associations connected with the Lancashire, Cheshire, and North Wales Federation, was summoned to be held at the Federation Board-room, Manchester, on Wednesday, September 29th, but as at the time for opening the proceedings there were only five local secretaries present, it was decided not to proceed with the business.

The Organising Sub-committee met on September 29th, and discussed their operations for the winter months.

The monthly meeting of the Administrative Committee was held on Friday, October 8th, but their report is not yet to hand.—John Tomlison, secretary, Cromwell Buildings, Blackfriars Street, Manchester.

LEIGH AND DISTRICT ASSOCIATION.

Secretary: S. Wigham.

At a meeting of the Master Painters, held at Higson's Restaurant, Market Street, Leigh, on Friday evening, October 8th, it was unanimously decided to give the operative painters six months' notice to adopt the following rules, to take effect from May 1st, 1910:—

1. Wages.—The standard rate of wages to be 8½d. per hour. No piece work allowed. Any member working in a sling or skip on mills, etc., to receive ½d. per hour extra.

2. Hours of Work.—Work shall commence on Monday at 8 or 8.30 a.m., at the option of the employer, and finish at 5.30 p.m. On Tuesday, Wednesday, Thursday, and Friday, at 6.30 a.m. till 5.30 p.m. On Saturdays, 6.30 a.m. till 12 noon. All men to leave off work in time to be at the shop at 12 noon on Saturday.

3. Overtime.—All time worked after 8 p.m. until 12 p.m. to be paid at the rate of time and half, and from 12 p.m. to 6.30 a.m. double time. On Saturdays, after 12 noon until 6 p.m. time and half, and from 6 p.m. until 8 a.m. on Monday, double time. On Christmas Day and Good Friday, 6.30 a.m. to 6 p.m., time and half; before or after these hours, double time.

4. Country Work.—Men employed on jobs above three miles and under fifteen miles from shop, 3s. 6d. lodgings and railway expenses to be allowed in and out once a week; if over fifteen miles and under forty miles, one a fortnight. If over forty miles, by special arrangement; but in no case to be over four weeks, and in all cases to be at the shop at 12 noon on Saturday, returning. 2s. to be allowed staying over Sunday.

5. Apprentices.—That one apprentice be allowed to three men, and no more than two be allowed in any shop, excepting during the last year of any apprentice, when another may be engaged to succeed him.

6. Labourers.—That no labourer be allowed to burn off paint, knot, putty up, or mix paint, or do any recognised painters' work, except limewashing, scraping ironwork, stripping paper, cleaning out gutters, and conveying materials to and from job.

7. Workmens' Responsibility for Tools.—That each workman shall be held responsible for all tools entrusted to his care, and shall make good any damage or deficiency (ordinary wear and tear excepted) before his full wages be paid.

8. Undertaking other work.—That no workman shall undertake jobs on his own, without the consent of his employer.

9. Alterations of Rules.—That no alteration be made in these rules either by the employers or operatives without giving six months' notice of same. The notice to expire on the last day of April.

LIVERPOOL ASSOCIATION.

Secretary: Bertram B. Moss.

The forty-third annual general meeting of the Liverpool Association was held on Tuesday, October 5th, in the Board Room of the association, 24, Sir Thomas Street. The chair was occupied in the earlier proceedings by the retiring president, Mr. Frank Griffiths, and there were also present many past presidents, officers, and members. The annual report, dealing with various matters of importance to the trade, and the treasurer's statement of accounts, were read and approved. Mr. R. Arthur Costain was elected president for the coming year. The newly-elected president, on occupying the presidential chair, having thanked the association for the honour conferred upon him, said: "One thing that has struck me during the time that I have taken an active part in the work of this association is the attention that has been given by your presidents to the work which they have undertaken; so that, within my own knowledge, for the past four years or so, there has hardly been one meeting of the association, council or committee, that has not been presided over by the president for the time being. What this has meant you have some idea of when you know that the local meetings have averaged something over 60 per annum, to say nothing of special Federation and other meetings held out of Liverpool.

"It is not my purpose to inflict on you any speech on this occasion, but there are one or two words which I wish to offer, bearing on the report which has been presented to you.

"It will be within the observation and experience of everyone present that our trade has passed through a period of very great depression for some years past, and we can only hope that we have now reached such a point that any change must be for improvement.

"It seems to me fitting to call the attention of the members of our association to the fact that the good work undertaken by your officers and council in the direction of improving the organisation of the association has borne such good fruit that it may be said at the present moment to be complete. Not only does this association comprise, as members, almost every firm connected with the building trade of our city, but we are also linked up as an association with the whole country. In the first place, we are brought in touch with the building trade of Birkenhead and Wallasey by means of the Mersey Federation, and we are also linked up with the trade of the two counties of Lancashire and Cheshire, and with North Wales by means of the Lancashire and Cheshire and North Wales Federation. We are also linked up with the whole of the North of England by means of the Northern Centre Federation; and finally all these federations are brought in touch with similar bodies throughout the whole country by means of the National Federation of Building Trades Employers.

"If there is anything remaining to be done that might improve the conditions under which our business is carried on, it may surely be thought that in such an organisation as this, we have machinery capable of achieving the object in view; and I therefore ask all the members present, and all the other members of our association, to give their most hearty support to any proposal that may seem advisable to your council that they should adopt, with this object in view. In fact, to justify the amount of energy and time that is occupied in carrying on such a series of organisations as ours, it seems to me necessary that a step forward should be taken; and the conditions under which our trade has been carried on during the past few years render it imperative that something should be done.

"In the past, on all occasions when demands have been made by the operatives, which in our opinion were either unreasonable or not justified by the condition of trade, there has been no difficulty in securing the active and earnest co-operation of the various individual members of our association, and we have stood loyally together as one man in mutual support against what we conceived to be contrary to our mutual interests. But, gentlemen, I would remind you that relations with the operatives are

not the only conditions with which we have to contend; and it is imperative, if we are to be enabled to carry on our trade in a satisfactory manner, that the same spirit of loyalty should be observed among us when other matters are under consideration, as has been usual in our dealings with the operatives. This can only be achieved by our being inspired with mutual confidence in each other, and it is to this that I specially wish to exhort you this evening, namely, that in any matters that may arise in which we may be called to have dealings with one another, we should consider that we are dealing with honourable gentlemen. In this way we should be in a position to receive from such an organisation as we represent, such mutual support as will enable us greatly to improve the conditions of our trade. The illustration used by the Old Romans will clearly bring home this point, when they spoke of the weakness of the single rod, which can be easily broken when dealt with by itself, but which when bound in association with other rods, presents such an obstacle as can hardly be overcome. I therefore ask you to pledge yourselves on your own behalf, and as far as lies in your power on behalf of those members who are not present, to give every possible support to your officers and council in the work which they will undertake on your behalf in this direction during the coming year, so as to achieve a step forward in our organisation. In closing, I would ask you to signify your approval of the good work done in the past by your officers and council, and especially by your retiring president, by according to Mr. Frank Griffiths a hearty vote of thanks for the splendid services which he has rendered to us, as president, during the past year."

This latter request was seconded by Mr. Chas. Tomkinson, the senior past president, and new senior vice-president.

Mr. Griffiths suitably replied.

The following further officers were also elected: Mr. Chas. Tomkinson, senior vice-president; Mr. R. Stevenson Jones, junior vice-president; Mr. J. T. L[illegible]thie, treasurer; Messrs. H. E. Dallow and [illegible] Sirett Brown, honorary auditors. Thirty-six members were elected to form the council for the ensuing year. The council is divided into six trade committees representing the bricklayers, masons, plasterers and slaters, carpenters and joiners, painters, plumbers and glaziers, and electricians

Various matters relating to dealings with the operatives were discussed.

Mr. J. B. Johnson brought forward the question of forming a Building Trade Exchange, and after considerable discussion, the matter was referred to the council for consideration.

The meeting terminated with a vote of thanks to the secretary, Mr. Bertram B. Moss, on the proposition of Mr. Hans E. Hughes, seconded by Mr. Frank Griffiths, the retiring president, and supported by the newly-elected president.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: J. Tomlison.

The monthly meeting of the Master Stonemasons' branch of the Manchester, Salford, and District Association, was held at the Board-room, Blackfriars Street, on Thursday, September 30th, when Mr. Wm. Deakin presided.

Matters of branch trade interest were discussed. The members, after the close of the meeting, retired to the Victoria Hotel for tea.

The Plasterers and Painters' Branch Committee met at the Board-room on Tuesday, October 5th. The question of the fixing and finishing of plaster partitions was the chief matter under consideration, and a deputation of manufacturers attended for the discussion. Ultimately a scheme was suggested to lay before each branch.

OLDHAM AND DISTRICT ASSOCIATION.

Secretaries: Cowper and Dean.

The Executive Committee of the Oldham and District Master Builders' Association have for some considerable time been dealing with the question of securing an arbitration clause in the contracts of the Oldham Corporation, so as to make same applicable to the fair contracts clause which is now inserted in their form of contract. The matter was finally settled by the committee on Monday, October 11th, when the opinion of Messrs. Ascroft, Maw and Shimeld, solicitors, Oldham, was read. The following is a copy of the letter received from such solicitors, and the matter is now finally disposed of so far as the differences between the Oldham Corporation and the Oldham and District Master Builders' Association are concerned.

[Copy of Letter.]

"FAIR CONTRACTS CLAUSE.

"We have now had an opportunity of considering the question of the right to appeal in respect of fair contracts clause adopted by the Town Council, July 7th, 1909, copy of which Mr. Dean left with us on Monday last.

"It would appear to us that if the clause had to stand by itself and be signed, the contractor who felt aggrieved by any decision of the Corporation would have the right to appeal at common law.

"We understand, however, that such clause would form one of the clauses to be incorporated in a full agreement made between the individual contractors and the Corporation, and that such agreement contains an arbitration clause.

"In our opinion such arbitration clause would apply to the fair contracts clause.

"We understand from Mr. Dean that you desire us to draft a slip which could be attached to any tender submitted to the Corporation by any contractor.

"We do not really think that any such slip is necessary, but it would certainly do no harm, and we should therefore suggest that a slip with the following words thereon might be printed and attached to each tender:—

"'This tender is in case of acceptance, subject to a condition that any contract to be entered into with reference to the performance of the work to which this tender relates, shall contain a clause providing that disputes arising out of or relating to such contract, shall be referred to arbitration pursuant to the provisions of the Arbitration Act, 1889, and any Acts amending or extending same.'

"Yours faithfully,

"(Signed) Ascroft, Maw and Shimeld."

PRESTON ASSOCIATION.

Secretary: John Tomlison.

The nineteenth annual general meeting of the Preston Association was held at the association offices, Mount Street, Preston, on October 6th, when Mr. T. B. Garnett (joiner and builder), at the commencement of the proceedings, presided over an attendance of about 60 members.

The half-yearly report of the committee stated that the strength of the society had been well maintained, there being 186 members on the books. The year, so far as the association was concerned, had been a very successful one in spite of the depression in trade, and it was cause for congratulation that the committee had been able to alter, furnish, and equip the new premises at considerable expense without trenching on the invested funds. The question of registering the premises as a club was having attention. Draft rules had been prepared, and it was hoped to utilise the rooms for social gatherings of the various branches of the trade during the winter months, in addition to the usual united functions. This would necessarily entail further expense; but with a continuance of the present membership the association was well able to bear it. Details of the work of the association during the half-year were given, and the report as a whole was unanimously adopted, as were also the annual statement of accounts and the balance sheet.

On the motion of the chairman, Mr. R. H. Catterall (master plasterer) was elected president of the society for the ensuing year. Mr. S. Salthouse (plumber and painter, etc.), was elected the senior vice-president; Mr. James Croft (of T. Croft and Sons, Ltd., builders), junior vice-chairman, and Mr. W. Cooke, jun. (plasterer), hon. treasurer.

Under the new rule, the election of the general committee was by ballot, each branch trade having previously nominated fifty per cent. more candidates than the number of representatives they were entitled to.

A proposal to amend the rule which prevents a member going on to a job where another member has the contract incomplete, or he has been paid off, or has given permission in writing, or by the permission of the committee, was defeated; the proposal being to exempt jobs where the contract is let in sections, or the work of the second em-

The usual votes of thanks were passed during the meeting, and at its close.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

A meeting of the Executive Council held in the Board Room on Tuesday, September 21st, Mr. R. J. Huntley presiding.

A letter was read from the joiners' society stating that they desired one starting and finishing time for both inside and outside men during the winter period, and that if this were agreed to they were willing to accept the employers' proposals. It was unanimously resolved to agree to this

Arising out of the matter of the working rules, the question was raised as to the rates of wages paid to apprentices and the hours of labour worked by them during the summer and winter period.—On the proposition of the president, seconded by Mr. J. M. Wright, it was resolved "that a circular be drawn up asking for the necessary information, and forwarded to the members requesting them to return it completed."

The secretary reported that he had sent a draft of the proposed rules to the bricklayers' society, who had replied asking for the insertion of fixed meal hours.—It was resolved unanimously not to agree to fixed periods.

The application of the wood-cutting machinists asking for representation upon the Conciliation Board was discussed; and, on the proposition of Mr. J. W. White, seconded by Mr. A. Stafford, it was resolved "that as the society are not represented upon the National Conciliation Board, the Sunderland Board cannot agree to their being represented upon the local Board."

The secretary reported that the stonemasons' society had agreed to and signed the altered working rules, which were accordingly signed by the employers.

The question of holding a dinner this year was discussed, and, on the proposition of Mr. J. W. White, it was resolved: "That this Executive Council recommend that an association dinner be held this year on the evening of the day of the Northern Counties' Federation visit to Sunderland in December, and that the Board of Representatives be invited to the dinner."

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

At the meeting of the Bradford Association held on September 28th, Mr. R. Raper, senior vice-president, in the chair, gave a report of the proceedings of the Yorkshire Federation, and drew special attention to matters in which members had had disputes with architects. The matters discussed were of great interest to the members, and were felt to be of considerable trade importance.

MIDDLESBROUGH ASSOCIATION.

Secretary: Walter Rigby.

The monthly general meeting of the Middlesbrough Association was held in the Corporation Hotel on Tuesday, October 5th, at 7.15 p.m., the president in the chair.

At a previous meeting Mr. P. Bray drew attention to a new order of the Corporation in reference to the height of back bedrooms partly in the roof. The secretary reported that, as instructed, he had written to several other towns for information as to their custom in such cases, and had received several replies. Mr. Bray, however, informed the meeting that during the month, through one of the councillors, a member of the association, the matter had been very satisfactorily settled. The builders were advantaged by the settlement, and the meeting expressed their satisfaction at the result.

A letter was read from the Teesside Association secretary containing a request from the Middlesbrough labourers, that they might become parties to the conciliation scheme and members of the Board. The ruling of the National Federation upon the labourers' case was read, and after some discussion it was decided to suggest that in accordance with the National rules, the Middlesbrough labourers be allowed to join the local conciliation board.

After the meeting, a smoker was held under the presidency of Mr. W. Masters. There was a large gathering of members and friends, including several Teesside Executive Committee, who came as the guests of the association.

WAKEFIELD AND DISTRICT ASSOCIATION.

Secretary: J. Beaumont.

The first meeting after the vacation of the members of this association was held at Bull Hotel, Wakefield, on October 7th. Mr. Tom Lee (president) was in the chair.

Before commencing the business of the meeting, the president made feeling reference to the recent death of Mrs. Fallas, the wife of Mr. Henry Fallas, an ex-president of the association, and the association's representative on the Yorkshire Executive Council, and moved a resolution expressing the deep sympathy and condolence of the members with Mr. Fallas in his bereavement. The resolution was passed in silence, and the secretary was directed to communicate the terms of the resolution to Mr. Fallas.

After the minutes of the last meeting had been, on the motion of Mr. J. W. Bramham, seconded by Mr. J. Pashley, read and confirmed, the minutes of the recent meetings of the Yorkshire Federation were read, and various questions dealt with at such meetings were discussed.

Arising out of these minutes, and correspondence from the Federation, it was decided, on the motion of Mr. E. A. Elvey, seconded by Mr. F. Clark, that a sum of £5 be remitted to the Yorkshire Federation treasurer for balance of subscriptions of the members of the association, and a remittance of £2 10s. as a further donation to the National Reserve Fund was directed, on the proposition of Mr. Elvey, seconded by Mr. J. W. Sanderson.

A letter was read from Mr. J. Davidson, the secretary of the Yorkshire Federation, in reply to one from the association stating that an official report of the Continental Town Planning Tour, arranged by the National Housing Reform Council, had been prepared and, on the proposition of the president, seconded by Councillor Spink, the secretary was directed to obtain a supply of printed copies of the report and distribute same amongst the members.

SOUTH SHIELDS ASSOCIATION.

Secretary: J. G. Robertson.

The monthly meeting of the South Shields Association was held in the Victoria Hall on Tuesday, October 5th, Councillor J. T. Armstrong presiding over a fair attendance.

After the minutes had been read and adopted, the question of the glaziers' reply to our letter was dealt with. The reply was not deemed satisfactory, and the secretary was instructed to write to them again asking them to arrange that a profit shall always be retained for the builder and contractor, and that outsiders be not able to buy at the same rate as those in the trade.

General satisfaction was expressed at the fact that the stamp duty had to remain as it was for property under £500, Federationists believing that this concession was in part due to the movement they initiated against an increase in the duty.

The secretary drew the members' attention to the articles that had apppeared in the "Builders' Journal" re architects and retention money. The meeting expressed itself as deeply grateful for the bold stand the Journal had taken on this question, and they trusted that as a result of the exposure made some at least of the most glaring cases of retaining money long after it was due would come to an end. The members were in hearty accord with any scheme that would help to bring about a better state of affairs, believing that the locked-up capital had a most disastrous effect on builders and the building

trade generally. They ended by wishing the Editor of the "Builders' Journal" "more power to his elbow" on this most important and vital question.

The question of insurance was discussed, but eventually it was agreed to remain in the same company as at present.

The meeting then considered carefully, especially in view of the litigation that is going on between the South Shields Corporation and the contractors for the new Town Hall, the decision in the Derby case of the Court of Appeal as summarised in last week's "Builders' Journal." A long general discussion ensued, the members practically being unanimous in their views of the matter. Eventually it was resolved to send a very strong resolution of protest from the branch to the Corporation, together with a copy of the decision of the Court of Appeal on the question of the architect as sole arbitrator, and to ask them even at this late stage, especially in view of the Court of Appeal's decision, to try to get the matter settled without further costly, and what was believed to be useless and vexatious, litigation.

On the motion of the chairman, the secretary was unanimously appointed to attend the secretaries' conference to be held at Leeds.

Midland Centre.

The usual quarterly meeting of the Executive Council of the Midland Centre was held in Birmingham on Thursday, October 14th. The president (Councillor H. Smith) took the chair, and there were also present: Messrs. Albert S. Smith, F. G. Whittall and R. Webb (Birmingham), A. Chambers (Leicester), A. Brazier (Bromsgrove), J. Beckett (Mansfield), H. Holloway (Redditch), W. J. Barton (Nottingham), T. Ham and H. Wil[illegible]k (Wolverhampton), R. Chambers (Walsall), J. H. Walker (Derby), and J. Bott (West Bromwich).

The Secretary reported that the cash in hand on account of the National Reserve Fund, was £26 11s. In order that the Centre might pay an instalment of £100 at the end of the year, he was instructed to make application for unpaid amounts promised towards the fund. The following are extracts from the secretary's quarterly report: "Whilst there seem to be some indications of revival of trade in other industries, reports show that the building trade is still in a depressed condition. No serious difficulties with the operatives had been reported during the quarter. The secretary attended the half-yearly meeting of the National Federation at Portsmouth, and has since forwarded to the local associations copies of the minutes and of the half-yearly report. Great reluctance had been manifested again this year in filling up the annual return of membership, and most of the returns sent in were incomplete. The work of the Centre had gone on quietly during the quarter, and in consequence of the holidays very few meetings had been held. The president, secretary, and Mr. A. W. Chamberlain had attended at Hanley on September 16th, to meet the North Staffordshire builders, but the visit had proved disappointing. The secretary had met the Northampton Association, and had discussed with them the question of forming a local conciliation board."

The report was received and ordered to be entered on the minutes.

The secretary was instructed to call the attention of the local associations to the resolution passed by the National Federation in reference to supplying priced schedules with tenders, and to request them to carry out the recommendations as far as possible.

The secretary was instructed to attend the Conference of Secretaries at Leeds on October 19th.

The secretary was also instructed to apply to the local associations for unpaid subscriptions.

A letter was read from Mr. A. G. White in reference to organisation.

The secretary was instructed to send at the end of the year to the local associations a list showing how the associations had been represented at the Council meetings during the year.

A question was asked as to what was the usual custom as to supplying hot-water services for domestic use, particularly as to whether the work should be done by heating engineers or plumbers.

The general opinion of the Council was that strong objection should be made to any attempts on the part of the operatives in the direction of demarcation of work.—FRED. W. AMPHLET, secretary.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The ordinary monthly meeting of Bristol Association was held at the offices, Guildhall, Small Street, on September 30, under the presidency of Mr. Frank N. Cowlin. There was a fair attendance of members.

Reference was made to the difficulty experienced by builders, when unsuccessful in tendering for work under the Corporation, in getting information as to the various amounts of tenders in order to see their position in the list, and how far they were out, as no official particulars were issued. It was accordingly decided to ask the president to interview the town clerk with a view to such information being transmitted to unsuccessful tenderers. It was mentioned that the same thing might be said of a large number of cases when tendering for work under architects, and it was suggested that this point might be raised at an interview which it was proposed to endeavour to arrange with the members of the Bristol Society of Architects.

A suggestion was made at a previous meeting that, as certain of the local architects complained that in some instances they were asked to conform with rules, in the framing of which they had had no voice, it might be well to arrange a Conference at a date mutually convenient, at which such matters could be discussed in perhaps a somewhat informal manner, to the possible benefit of all concerned. It had been decided to postpone the consideration of this subject until the autumn, and accordingly it was now brought under the notice of the meeting for discussion. The general consensus of opinion was that such a Conference could not be otherwise than satisfactory, as, although the relationship existing between the Bristol architects and the builders was of a most friendly character, there were many little points which might with advantage be set before such a gathering—such as, for instance, depositing of priced bills of quantities; tendering for time and money; attendance on other trades, etc., etc. Accordingly the secretary was desired to get into communication with the secretary of the Architects' Society with a view to arranging a suitable date for such conference, after which a further meeting could be held to decide definitely as to the points for consideration.

This being the first meeting of the Association since the Federation Conference at Portsmouth, Mr. E. J. Neale briefly referred to the business transacted thereat.

Arising out of the remarks made by Mr. A. G. White, the National Federation secretary, at the annual summer excursion of the Association in July last, the question as to the adoption of the inter-trading rule by the Bristol Association was discussed. The president remarked that the conditions in the West were different from those in the North of England and the Midlands, where each trade was practically a separate industry, and carried on as such, and he thought there would be some difficulty in adapting the rule to local conditions, although, of course, he recognised its value.

Mr. Neale thereupon put before the meeting a specimen telephone card, which he had received from Mr. White, and said that possibly something might be done in the direction of a modified form of inter-trading rule in connection with that publication,

the members undertaking, wherever possible, to give the preference to those firms who became associate members of the association, and had their names inscribed on the card; this, he explained, would also materially benefit the association funds.

Eventually it was decided that a sub-committee, consisting of the president, Messrs. Chown, Neale, Perkins and Woodward, go carefully into this matter and report to the next meeting of the association.

The sub-committee appointed to go into the matter of the inter-trading rule was asked also to give their attention to ways and means of extending the influence of the official organ of the Federation in the district.

Proposed New Works.

BIRMINGHAM.—A L.G. Board enquiry has been held at the Birmingham Council House, to enquire into the application by the Council for sanction to borrow the sum of £121,217 for the extension of the Birmingham Council House; and also sums amounting to £8,355 for works of sewage and street improvement.

BLACKPOOL.—The Building Plans Committee of the Blackpool Corporation at their usual monthly meeting approved of 22 of 45 plans submitted. The following were included:—Detached dwelling-house, greenhouse and buildings, Peddar's Lane, South Shore, J. W. Cardwell; three houses, Marlborough Road, John Whiteside; two houses, Westfield Road, John Porter; two houses, Whitegate Drive, A. J. Haworth; one house, Moon Street, Wm. Bamber; two houses, off Holmfield Road, and Warbrick Hill Road, Jas. Leach; ten cottages, Onslow Road, G. F. Clarke; house and shop, corner of St. Walburga's Road and Onslow Road, Joseph Wignall; house, Park Road, Misses H. C., E., and M. J. Gourlay; eleven houses, Oxford Avenue, John Gregson; two houses, Palatine Road, Wm. Bailey; four houses, St. Alban's Road, Frank Lumb; elementary school, Queen Victoria Street, Blackpool Education Committee; elementary school, Manchester Road, Blackpool Education Committee; additions to Arnold House School, South Shore, F. T. Pennington; new streets, St. John's Estate, St. John's Estate Company.

BRADFORD.—The proposed extensions to the Royal Eye and Ear Hospital are estimated to involve a sum of £10,000. The additions, which are Gothic in style, have been designed by Messrs. Mawson and Hudson, architects.

CHESTERTON (CAMBS.).—A new elementary school for the parish of Chesterton is proposed to be erected in Richmond Road. It is to accommodate 150 children.

CLYDEBANK.—Mr. Carnegie's offer of £10,000 for the erection of a library has not been received with general favour. At the meeting of the Second Ward ratepayers three representatives declared themselves unfavourable to the project, and this attitude was received, it is stated, with loud applause.

HEXHAM.—At a meeting of the Rector and churchwardens, a letter was read from Mr. Temple Moore, architect, stating that Messrs. Holloway Bros., Ltd., London, were taking immediate steps as might be necessary to prevent any accident due to the alarming condition in the north transept, and that preparations would be made for such scaffolding, shoring, and supporting as might be required.

HULL.—The enlargement of the present, or the provision of a new, Sanatorium, is estimated to cost anything up to £15,000.

LEEDS.—A L.G. Board enquiry has been held, respecting an application by the Leeds Corporation for sanction to borrow a sum of £15,737 for the reconstruction and widening of the bridge carrying the Leeds and Bradford road over the river Aire, near Kirkstall Station. The new bridge will be 50ft. in width, whereas the present one is only 22ft. wide.

LONDON.—Mr. Emslie J. Horniman, M.P., whose father presented Horniman's Museum and ground to London, has promised to give £4 500 for the erection of a lecture hall at that institution, to accommodate about 200 persons. The only conditions attaching to the gift are (1) that the architectural designs shall be subject to Mr. Horniman's approval, and (2) that at least forty-eight lectures are given each year to teachers or children without charge for admission.

NEW MILLS.—About £1,200 has been subscribed towards building a church at Bank End, between Newtown (New Mills) and Furness Vale, on a site given by Colonel Cotton Jodrell, C.B.

NORWICH.—A public meeting has been held here in support of the appeal of the Governors of the Norfolk and Norwich Hospital in aid of the fund which is being raised to defray the cost of the considerable additions which have been found to be necessary for the development of the institution. To provide these will cost about £25,000, and a further like sum is required for endowment purposes. £14,000 has already been subscribed, his Majesty the King, who is patron of the hospital, showing his interest in the scheme by subscribing two hundred and fifty guineas. His Majesty has graciously signified his intention of laying the foundation-stone of the new isolation block for cases of infectious disease amongst the patients, and of a separate building for septic surgical cases—two of the chief requirements—on the occasion of his visit to the city on the 25th inst.

NORTON.—The Town Council, having received a communication from the Board of Education stating that, after careful consideration they had decided that the proposed new school was not necessary, have addressed a letter to the Board, pointing out that the provision of a new school is not of immediate urgency, and expressing an earnest hope that the decision may be reconsidered.

NOTTINGHAM.—A L.G. Board enquiry into the application in regard to the sanction of a loan of £4,300 for the rebuilding of part of the Shire Hall at Nottingham, has been held. It was explained that in March last a fire occurred on the premises occupied by the county departments, several rooms being completely destroyed and others considerably damaged. The Standing Joint Committee came to the decision that it was advisable to erect entirely new property. A scheme was, therefore, prepared, and it has been submitted to the County Council. The proposed new building will consist of a basement, the ground floor, first floor, second floor, and third floor, with a Mansard roof.

ROATH.—A sum of £12,000 is needed for the erection of a parish hall, enlargement of St. Margaret's Church, and the erection of a vicarage, mission-hall, and room near Kimberley Road, Penylan.

SHREWSBURY.—Mr. Edgar Dudley, F.S.I., a Local Government Board inspector, has held an inquiry in regard to the application of the Shrewsbury Corporation for powers to borrow two sums of £8,000 and £8,080 to be expended in the erection of public slaughter-houses, stables, and depot.

WAKEFIELD.—The Education Committee have reported that, owing to the demands of the Board of Education it had become necessary to build a new school. A resolution that a plot of land situated in Lawfield Lane be purchased for the erection of a school to accommodate 900 scholars has been adopted.

WILLESDEN.—The Willesden District Council are negotiating for the purchase of an acre of land at Neasden for the erection of an elementary school, and are compelled to pay £1,500 for a site which is rated at only £2 per annum.

WIMBLEDON.—An agreement has been completed between the Wimbledon Borough Council and the Surrey County Council, for the extension of the Wimbledon Technical Institute.

Notes and News.

The Lord Mayor of London, as chairman, and the Executive Committee of the Shakespeare Memorial National Theatre, have convened a Conference of local authorities at the Mansion House on October 23rd, at 3 o'clock, for the purpose of discussing the scheme. The speakers will include Mr. Birrell, Lord Lytton, Miss Ellen Terry, Sir John Hare, and Mr. G. Bernard Shaw.

* * *

Messrs. Ed. Wimperis and Best, architects, 61, South Molton Street, W., announce that owing to the necessity for larger and more convenient offices, their address has been changed as given above. Their telephone number and telegraphic address remain unchanged—telephone. 6892 Gerrard; telegraphic address, Wimpelstok, London.

* * *

Messrs. L. and C. Hardtmuth have decided to erect a building, worthy of the magnitude of their business, in Kingsway. This fine erection will be commenced shortly from the designs of Mr. J. S. Gibson, of 5, Old Bond Street, the builder being Mr. Jas. Carmichael, of Wandsworth, Messrs. L. and C. Hardtmuth being the manufacturers of the well-known Koh-i-Noor pencils, as well as the sole European representatives for Waterman's Ideal fountain pens. The building will bear the title of "Koh-i-Noor House."

* * *

The Columbian Fireproofing Co., Ltd., have secured a £14,000 contract for nearly five miles of high-pressure water-pipes, 24ins. diameter, on the "Bonna" system of reinforced concrete, for the Corporation of Swansea, under the the general contractors, Messrs. J. Aird and Son. In addition to the above, the Columbian Fireproofing Co., Ltd., are constructing the "Bonna" pipes, 18ins. diameter, for the Clydebank water trustees (£19,000), also for the Belfast Corporation, 21ins. diameter (£1,700).

* * *

The net profits of the Bath Stone Firms for the six months ended June 30th were £5,003, and £7,045 was brought forward. An interim dividend at the rate of 5 per cent. per annum has been declared, leaving to carry forward £6,371.

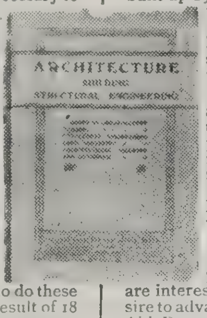
* * *

The Agent-General in London for Queensland has just received the annual report of the Forestry Department in that colony. The total forest area in Queensland is 40,000,000 acres. The whole forest area of Australia is 97,003,000 acres. Special areas of timber amounting to close on 4,000,000 acres are reserved by the Government. The export of timber from Queensland for 1908 was 800,000 super feet, the greater part of this was undressed timber. Japan took about half of this quantity, and the United Kingdom and Germany came next as buyers. The saw milling industry is active in Queensland; 65,000,000ft. of soft woods, and 35,000,000ft, of hardwood were cut in 1908. The value at the mill per 100 super feet is: soft woods 12s. 6d., hardwood 13s. 10d., and cedar 33s. 4d.

* * *

The construction of the new Campanile at Venice is proceeding apace, and 1911 should see its completion. It has been fortunate in being relieved of all pecuniary embarrassments, and the original estimate of £72,000, and the later calculation of £80,000, have already been supplied, together with a comfortable surplus for emergencies. The new Campanile will resemble the old in appearance, though iron clamps and girders will, in reality, make it entirely safe. The only proposed alteration is the removal of a pillar which stood in the centre of the tower, in favour of a passenger lift. For the most part, too, old associations are being preserved, the stone being quarried in Istria, the cement coming from Montferrat, the sand from Brenta—places all famous in Venetian history.

It is Surprisingly Easy for the ambitious man or woman to qualify for a highly-paid position



It is not necessary to attend a technical school. It is not necessary to lose one moment from your day's duties. It is not necessary to interfere with your engagements. It is not necessary to buy text-books or apparatus. It is not necessary to have a private tutor or "coach."

The International Correspondence Schools will teach you the science, the theory, the practical reasons of your chosen line in your own home, your own time, practically on your own terms and the Course will include all the books, papers and outfits you need

That the I.C.S. is able to do these astonishing things is the result of 18 years of successful concentration. The Courses have been prepared at an expense impossible to any but an Institution made prosperous by the prosperity of its students—built up by the recommendations of those many men and women who have reached higher places and bigger salaries through its thorough training.

All we ask is, if you aspire to control, rather than be controlled—that you let us send you free information and some of the letters which both students and employers have written us voluntarily.

Simply send a postcard. Mention the business or professions in which you are interested and in which you desire to advance. The I.C.S. Students' Aid Department puts graduates in touch with employers, free.

New Zealand Architecture.

The competent British architect is looking towards New Zealand with mingled hope and despair. It should afford him a fine field for the realisation of his ideals, artistic and financial. But the question is, Would it? Lord Plunkett has said that New Zealand architecture is contemptible. Mr. P. A. Vaile, writing in a London evening newspaper, says of this utterance that "it sounds nasty, but it's true." He indicates how this vileness arises. The Council decided to have one side of Auckland Town Hall ("locally called the Flat Iron") in Oamaru stone (creamy white), and the other in red brick and cement; and you could see both sides at once! Mr. Vaile had a model made to scale and painted to colour, "and now both sides are being made of Oamaru stone!" The admiration mark is Mr. Vaile's, but its precise significance is not clear to us. We are unable to determine whether it may be taken as expressing surprise at the preference for creamy white, or whether, on the other hand, it indicates admiration for his own powers in converting the heathen from their parlous proclivity for piebald perspectives. Evidently their case is not hopeless; for although they are spending £100,000 on this remarkable building, they do not insist on having it variegated in conformity with their luxuriantly exotic tastes. Mr. Vaile hopes that his observations may lead English architects "to watch Colonial competitions, to see how much their work is inspiring Colonial architects, and perhaps to compete themselves." Who will be the pioneer in this missionary work? It would be no mean thing to go down to posterity as the proto-martyr of the architectural conversion of New Zealand.

Labour Exchanges.

An interesting development of the labour exchanges problem is taking place in Germany. The decision of the Rhenish-Westphalian Collieries Union to establish a centralised system of labour exchanges has called forth a strong protest from the trade unions. The objection seems to be based on the fear that centralisation will give employers too complete a control of the stream of labour. This point is worth noticing, because in this country the positions seem to be reversed. The movement in favour of labour exchanges seems to have sprung from the workers, and to be regarded with a certain amount of suspicion by employers. For ourselves, we have from the outset believed that labour exchanges may be and should be of equal advantage to both parties; but we realise that it may possibly be difficult to hold the balance level. Builders, as representing our greatest constructive industry, will certainly watch the movement with the keenest interest, and employers may be trusted to see that it is not wrested to their own disadvantage.

The Selection of "Shocking Examples."

We seem, as a nation, to be getting supersensitive to criticism. A lecturer on architecture who had ventured to treat of "Chorley—Ugly and Beautiful," was surprised to find that his observations "had been received not altogether with favour," and he took the first opportunity of explaining that what he meant to convey was "that Chorley, like many other towns, was very ugly when compared to the beautiful cities of ancient Greece and Rome." We trust that this explanation has been found satisfactory, but should be rather surprised to find that the champions of Chorley are pacified. Have comparisons ceased to be odious? If a man told his wife that she was very ugly, would it be as balm to her wounded vanity to explain that he only meant very ugly as compared with the Venus of Milo? We wish that the lecturer had stuck to his guns, and had endeavoured to strengthen his accusation instead of refining upon it with a sort of half-hearted apology. The incident shows that there is much virtue in the proverb, "The truth always offends." A great deal depends, however, on the method of statement. To any lecturer on architecture who is desirous of speaking the truth in love, we would respectfully commend the delightfully delicate method of Lord Byron in dealing with his publishers. He wished to lodge a complaint with Saunders and Otley; so, "Look here," said he, "I don't wish to be discourteous; but if you are Saunders, confound Otley; if you are Otley, why, confound Saunders." The architectural critic would be on much safer ground. If he wanted to condemn the buildings of A, he should go to the neighbouring township of B to do it, and vice-versa. Then both would be highly delighted, because each likes to be told of the other's faults; and the object in view—that of indicating what is architecturally ugly, and why—would be quite as effectually achieved by this indirect method of approach. We certainly think that this point is worth the attention we are bestowing upon it. We want to make a clean sweep of architectural ugliness; but we realise that while it is tremendously difficult to convince a man of his own sins, it is comparatively easy to make him see the exceeding sinfulness of sin in others.

An International Exchange.

The advantages of organisation have not been exhaustively ascertained. Some of them are very obvious, others need expounding, and yet others reveal themselves somewhat unexpectedly. In this last class may be surely included a development recorded in last week's issue by Mr. A. G. White, the secretary of the National Federation of Building Trades Employers. The Special School for Public Works and the Building Trade, Paris, wanted to obtain for one of its students facilities for gaining experience of practical work in England. Mr. White saw that the idea was good, and was able to make excellent arrangements for carrying it out. Moreover, two of the Belgian master builders who recently visited this country approached Mr. White with a similar object. It then became apparent that if our French and Belgian friends thought English experience desirable, there is no good reason why we should not return the implied compliment. We naturally feel flattered to find that French and Belgian builders think that our methods as well as our language are worth careful study; and our insular conceit is by no means so colossal as to lead us to suppose that we have nothing to learn from the Continent. Mr. White at once saw the possibilities of interchange, and he has ascertained that this view is agreeable to our Continental friends. In Bunyan's phrase, we "wonder whereto this thing may grow." If the notion catches on, its extension beyond the bounds of the building industry is certain. Travelling studentships for young architects and young decorators are already established, and the value of the experience that is thus to be gained is indisputable. The somewhat similar movement which Mr. White has set on foot should be hardly less valuable. It should give the young builders of each nation a broader outlook as to men, methods, and materials. It is very certain, indeed, that the various nations have still much to learn from each other, and Mr. White has indicated one very practicable way in which valuable experience may be interchanged, and more cordial international relationships encouraged. The essential unity of the building industry, about which we had a good deal to say a few weeks ago, seems, in the light of Mr. White's announcement, to have assumed at least a tinge of international significance!

Sooty Cities. An intensification of the colour sense is a very natural concomitant of the growing revival of taste. It is therefore becoming a habit to talk of the colour of cities. Books are being published under such titles as "The Colour of London," "The Colour of Paris," and so forth; and we now see that Professor Adshead, of the University of Liverpool School of Civic Design, has been making observations on the colour of cities. He is reported as saying, "A city which is white, and which scintillates and reflects the blue of the sky and the light of the sun, is the only fit background for the brilliant crowd with which every progressive city from Athens to New York has stood possessed. The city which is white has the greatest refinement and charm. Cities which are grey, like Edinburgh, suggest endurance, grandness, and romance. All great cities are either white or grey." This, it has been said locally, is rather a serious aspersion on Liverpool, which, it has been promptly pointed out, is neither grey nor white; for "Liverpool, except at the Pier Head, is certainly a city of soot." We are glad that we were not the first to hiss out those alliterative sibillants. Those who live in sooty cities should not blacken buildings that are elsewhere; and we in London have no redeeming Pier Head, and now, alas! no admonitory Adshead; unless, indeed, we may be allowed to claim that the learned and genial professor belongs as much to London as to Liverpool, and more to architecture than to either. Even our White City is rapidly assuming all the tints of autumn, and is therefore, like Liverpool, and perhaps London, outside Professor Adshead's category, and so are the "brownstone" cities of the United States; while, if whiteness or greyness are essential to real greatness, we fancy that there are some Continental and Eastern cities that could hardly qualify; to say nothing of the cities of New Zealand, where, as mentioned in a previous note, there is an apparent "letch" for buildings that are parti-coloured. But if, as the German proverb has it, "by night all cats are grey," so, perhaps, are all cities; suggesting, therefore, when the lights are out, "endurance, grandness, and romance."

DESIGN IN REINFORCED CONCRETE.

Design in armoured concrete, as in steel construction, naturally resolves itself into two parts. On the one hand the estimation of the possibilities of loading on the structure and the bending moments and thrusts and tensions produced thereby—the external forces, as they are called; and on the other hand the design of the various beams, columns, struts, and ties of such a strength as to enable them to resist the external forces with a certain margin of safety. The first half of the problem is almost the same as for construction in steel, and the necessary knowledge for its solution should already be part of the mental equipment of every engineer, though it is now complicated considerably by the monolithic nature of the finished structure. For, says a writer in "The Times," whether for the purposes of design it is so considered or not, an armoured concrete structure is—unless deliberately sectioned into parts—essentially monlithic, and beams and floors passing over several supports are necessarily continuous girders and must be so considered if satisfactory results are to be obtained.

Unfortunately, the analyses of the moments for beams involving the property of continuity is by no means such a simple business as for beams of a single span, for not only does the maximum bending moment differ considerably in contiguous spans and vary again from the bending moment over the supports, which is usually so much greater as to necessitate the depth of the beam being increased slightly at this point to prevent the concrete from being unduly stressed, but all these figures change again with the number and relative length of the spans. The contingency whereby some of the spans might be loaded while others are left vacant must also be duly considered, and the possible negative moment produced thereby must be guarded against.

Once the external forces have been properly determined, and this can only be done by engineers possessing both practical and mathematical knowledge, the procedure for the design of the beams and columns to resist these forces is fairly simple and perfectly definite and accurate. There is no need at all for the approximate methods of calculation occasionally advocated, which nearly always involve a disquietingly indefinite amount of inaccuracy. The recognised rational formulæ are not unhandy in the working, though perhaps rather terrifying at first sight, whilst the graphical methods are still more accurate and expeditious in use. As soon as the depth of the beams and the size of the columns have been decided, either by the untrammelled considerations of economy or the practical and æsthetic exigencies of architecture, a certain series of points has to be considered. First the necessary areas of metal in tension and concrete in compression must be calculated so that the stresses in these materials do not exceed a selected limit. Since the bending moment is constantly varying in sign and amount from one span over the support to the next, the points at which some of the armouring may be stopped off or at which armouring in the top of the beam over the supports must be introduced must also be inquired into.

The armouring against the shearing forces may be done either by bending up some of the tension bars, by the introduction of stirrups, or by a combination of both methods. In any case the area of metal to resist shear must be carefully calculated, and the stress must not be permitted to exceed the proper limit.

The armouring in a beam should, as it were, reflect the variations of the bending moment and shearing forces. How accurately it must do so, and to what extent it may be advisable to put in an excess of material at certain points, are considerations which the practical difficulties of construction will often determine, but the armouring must never be less than the calculated amount, or the factor of safety is encroached upon and a weak spot is introduced into the structure, which, like the hawser joined with twine, renders the excess of strength of the former at once useless and wasteful. It is this point which is ignored by those who under a plea of greater simplicity—usually to be construed as less expensive work in the drawing office—advocate design by fixed rules and average bending moments. Any averaging of the bending moments must necessarily give too much armouring at some points, which is extravagant, and not enough at others, which makes the other excesses all the more unnecessary. The factor of safety also then becomes a factor of ignorance or parsimony, and must be taken higher in proportion. This does not tend towards economy.

What is really essential for the design of reinforced concrete is a sound engineering instinct, a good mathematical training, and, for the practical side of the question, a large experience in the use of this material.

NOTABLE BUILDINGS OF CHELTENHAM AND DISTRICT.*

By F. Dare Clapham, F.R.I.B.A.

The Romans existed in these parts for a period of 400 years, and, as showing the extent to which they populated this neighbourhood, out of just over 300 parishes in Gloucestershire, Roman remains have been found in about a third.

"The" Garden City.

After giving a succinct history of Cheltenham and district from A.D. 43 downwards, Mr. Clapham noted that Cheltenham has been termed the Garden City, and that it certainly abounds in gardens, both public and private. It is beautifully situated in the valley of the Severn at the foot of the Cotswolds, which bound the valley on the east side, while on the west are the Malvern and Forest of Dean Hills. From these hills come numerous springs, forming brooks, which run through the villages of the district and make them so picturesque. At Seven Kings, about four miles from Cheltenham, the River Thames has one of its sources.

The Cotswold district was for centuries celebrated as the centre of the sheep-farming industry, and even 800 years ago wool from this district was exported to Flanders and elsewhere, and, judging from the size of the farms and the outbuildings generally, the farmers three or four centuries ago must have been very prosperous.

Domestic Architecture.

The domestic architecture is probably as interesting and characteristic as that of any other part of the country. Its chief charms are its great simplicity and splendid proportion. The character of the work is generally the same, owing to the natural use of local materials, built according to local traditions, and influenced by surrounding conditions.

The houses were generally built in some sheltered position, often on sloping sites, but beyond this precaution very little attention seems to have been paid either to aspect or situation. The whole district being a stone one, all buildings were constructed in limestone, usually quarried from the immediate neighbourhood. The stone weathers well, and when first quarried is distinctly yellow, but it soon tones down, and takes on after exposure all kinds of beautiful greys and yellows.

In the better class of work the exterior walling was executed in ashlar, carefully dressed, with upright joints, and laid square on bed.

The plans of the houses were very simple, and the stone outer walls were 2ft. to 2ft. 6ins. thick, the internal divisions being simply lath and plaster or oak panelling. In order that they might be roofed in one span, the plan was usually one room deep, the rooms being 16ft. to 20ft. wide.

The roofs were of a steep pitch, and covered with stone slates, laid in diminishing courses, and the roof space was used for bedrooms and lighted by windows in the gable ends or by dormers

Very often the wall plate was placed in the centre of the wall, and the stone slates at the eaves were bedded on the wall with only a slight projection, which gave a considerable tilt to the eaves.

There were no gutters, and at the intersections of the roofs the stone slates, which were laid without any torching, were brought round in a sweep, a method known locally as "galetting," and the ridge piece, too, was sawn out of a block of stone.

In many cases the copings to the gables are only a few inches higher than the stone slating behind, and in the smaller houses the slates simply project a little in advance of the wall face.

The chimneys were usually carried up centrally over the ridge, the flues being built separately, either square or diagonally in groups of three or four; they were formed of thin sawn blocks of stone, and finished with a moulded cornice and a weather mould at the base as a protection to the roof.

---

*Substance of a paper read to the Architectural Association on Friday, October 22nd.

The finials on the top of the gables and over the springing stones are of great variety, and were often pierced on all four sides.

The windows have stone mullions with square heads and a label mould over. These labels were very often carried round the house as a string course, and in several houses there is a set-off at each string course. The lights were narrow and squat, and usually decreased in number on each succeeding storey. There was generally a thicker central mullion where the lights exceeded three in number.

The lead glazing of the windows was ornamental, and the opening casements were fitted with wrought-iron fastenings, very often beautiful in design, and showing what excellent work used to be executed by the local smiths.

There was no external porch, and where one does occur it has usually been added at some later date. The doorways were simple, the doorhead being, as a rule, four-centred and out of one stone, and internally there was no arch, but always a flat lintel. All the original doors were plain, and, like the windows, the wrought-ironwork was always good in design. A predominating feature of the interiors of the houses was the large open fireplace, very often of great width compared with the size of the rooms.

The staircase was placed in the centre of the house, and in many cases had a solid newel about 5ins. square, with solid oak treads, and when the house was built on a sloping site the different levels were very cleverly arranged. Most of the work in the district was executed between the end of the sixteenth and the close of the eighteenth century.

I do not propose to take each place in the order in which we saw them, but in the order in which they are situated on the chief roads out of Cheltenham.

Postlip Hall.

About five miles to the north east of Cheltenham is Postlip Hall, picturesquely situated on the slope of the hills and overlooking a valley on the south. Originally the house consisted of three distinct blocks of buildings, the eastern part being a farmhouse, with a dwelling-house on the west, and two cottages to the north. Not much is known of its early history, but at the beginning of the seventeenth century the house was rebuilt by a certain Giles Broadway, or Giles of Broadway. The main elevation which faces south has a frontage of 94ft., broken by three bays and roofed with a range of sharply-pitched gables, six in all, the one on the east being wider than the others, and evidently the older part of the house. The return elevation on the east has a series of small simple dormers along the whole length of the roof. In the centre of the house is a picturesque courtyard, containing a circular fountain, which gives it quite a continental appearance. Internally there are some fine rooms, richly panelled, and some good chimneypieces.

The best room is the drawing-room on the first floor, which has some good panelling that has not been tampered with, and an elaborate stone chimneypiece with some curious emblematical figures in the upper part, one representing apparently Temperance triumphant over Intemperance.

The chimneypieces in the dining-room and hall are richly carved in wood, but appear to have been made up to a certain extent. The one in the dining-room is dated 1614, and bears the initials of the original owner and his wife. The staircase, like others in the district, winds round a square newel wall, and has solid oak treads, with a nosing worked on.

A Norman Chapel.

On the slope of the hill behind the house on the north side is a small Norman chapel dedicated to St. James. Its origin is interesting, for it appears that the tenants of Postlip, in the early part of the twelfth century, petitioned the Lord of the Manor, William de Solers, to build them a chapel in their immediate neighbourhood, as, owing to the unsettled state of the country during the Civil Wars, they were afraid to attend their parish church. At the time of the Reformation it was despoiled and allowed to fall into decay, and until twenty years ago was used as a barn. It was restored in 1891, and is now used as a private chapel. It is an interesting Norman building, with a doorway on the south side. Perpendicular windows have been inserted in the west and east ends, but the original Norman windows still remain on the north and south sides, mere narrow slits in the walls with a deep splay inside. Over the chancel wall is a simple stone bell turret, and another interesting feature is a small opening high up in the nave wall on the south sire with an external corbel; this was probably intended to hold what is known as the "Poor Soul light," which was a lamp lighted nightly to remind those who passed by and saw it to pray for the souls of the departed.

M. RODIN AND HIS LATEST WORK. *Photo: Topical.*

The new Monument to Victor Hugo in the Garden of the Palais Royal. The Sculptor, M. Rodin, is standing beside it.

At the foot of the hill to the south-west of the house is an old barn, cruciform on plan, about 96ft. long and 28ft. wide, and the manor house, chapel, and farm buildings form a very picturesque group amidst the surrounding trees.

A few miles further along this road is Winchcombe, an ancient town, called in Anglo-Saxon times "Wincelcombe," which means "a corner of the valley," a very appropriate name, as it lies at the end of a beautiful valley, almost entirely encircled by the Cotswolds.

Winchcombe Abbey.

In the ninth century Winchcombe was the capital of Mercia, and a royal residence, but its importance was chiefly due to the fame of its Abbey. King Offa built a nunnery there in 787, and towards the end of the same century his son Cenulph founded a Benedictine Abbey on the same site for 300 monks, and dedicated it to the Blessed Virgin Mary. At his death he was succeeded by his young son Kenelm, aged seven, who was murdered by order of his sister. Tradition says that the fate of the young King was miraculously revealed in various ways. At any rate, when his body was discovered it was removed to Winchcombe, and the Abbey in consequence became popular as a place of pilgrimage, as the relics were credited with working miracles. A famous historian of the period, William of Malmesbury, says "that there was hardly any place in England more venerated." The Abbey was partly destroyed by the Danes, and it is believed to have passed into the hands of secular priests, but towards the end of the tenth century it was rebuilt and given back to the Benedictines. Up to the reign of King Canute the town had been a county in itself, but it was then united with Gloucester. The town was made a borough in the reign of Edward the Confessor, and the Doomsday Book records that the possessions of the Abbey were unusually large, no fewer than nineteen manors being attached to it. The Abbey was destroyed by fire in 1151, and rebuilt again in 1239. That it was considered of great importance is confirmed by two facts—first, it was a mitred Abbey, and its abbot sat in the House of Lords, and secondly, Edward III. granted it permission to fortify its buildings, a rare privilege and one seldom granted.

On the dissolution of the monasteries the inhabitants who possessed a parish church did not trouble about the Abbey, which gradually fell into decay and disappeared, and now all traces of it above ground are lost. In the fifteenth and sixteenth centuries the prosperity of the town was evidently on the decline, for Edward IV., and later on Elizabeth, granted it charters for holding fairs in order to relieve the poverty of the inhabitants.

The parish church was built by Abbot William in 1490. It is a fine example of Perpendicular work, and consists of a western tower, nave, aisles, and chancel. There is no chancel arch, but the divisions between the nave and the chancel is marked by screens, and in addition across the nave an upper screen or roof truss. There is a lofty clerestory which makes the church remarkably well lighted. There is a curious Jacobean front, dated 1634, and some elaborate sedilia on the south side of the chancel. In the eighteenth century the altar stood centrally, surrounded on four sides by rails, with seats for communicants on the south, east, and north sides, an arrangement which also existed at the neighbouring church of Deerhurst. The church contains some good furniture, and some fine silver plate. Externally, the chief feature is the western tower, with a good weathercock, said to have been brought from St. Mary's, Redcliffe, Bristol. The church is also notable for the great grotesque gargoyles, some forty in number, on the parapets and tower.

Seventeenth Century Houses.

There are several good seventeenth century houses in the town, the best being a picturesque gabled building known as the "Jacobean House," which stands opposite the church, the detail of the entrance front being particularly good. According to an inscription in Sudeley Church, this house was restored and enlarged by Mr. Wyatt in 1879, who had also restored the church some few years before.

Other interesting houses are the George Inn, which was the resort of the old pilgrims, and is inscribed with the initials, "R.K." Robert Kidderminster, an abbot of the time of Henry VII., and another inn in the main street called "The Corner Cupboard," a long, low, rambling place on the street approached by a flight of stone steps, semi-circular on plan There is also a simple Georgian house with interesting detail.

Sudeley Castle.

About one mile from Winchcombe is Sudeley Castle; the property belonged in the olden times to King Ethelred, and was granted by him to his youngest daughter, the Countess of Goda. In those days its value must have been great, for it included a forest of oaks, covering an area of about 6sq. miles. In the French wars during the reigns of Henry V. and VI. a certain Ralph Boteler took an active part and rebuilt the castle from booty gained in the war; he it was who helped to build the parish church in Winchcombe.

In the time of the Civil Wars Sudeley was looked upon as the strongest fortress in the neighbourhood, ranking with Berkeley and Warwick, and as the royal forces occupied Oxford, it became of great importance, for it could command all the district between Camden and Cirencester, but it was captured by Colonel Massey in 1643, and given up to the Royalists later on at the fall of Cirencester. It again surrendered to Sir William Waller, who trained his guns on the castle from Dunn's Hill on the east, and the Parliamentary forces, although only 300 yards off, are supposed to have only hit the castle once. Later on Lord Chandos seceded to the Parliament, and the Commonwealth ordered it to be rendered unfit for a military post, and it was accordingly demolished after being garrisoned for five years. From this time nothing much is known of the castle, and at one time it became a public-house. In the early part of the nineteenth century the estate was purchased by John and William Dent, of Worcester, and they set to work to make the castle fit for a country residence.

There are some interesting pieces of furniture in the house, among them the bed of Amy Robsart, from Cumnor Castle—it is peculiar as having a secret panel in the head containing a crucifix—and in another room there is the bedstead and tapestry from Marie Antoinette's bedroom, removed here when sold at the Revolution, and there is also some good Spanish leather in the dining-room, and generally the house is full of interest.

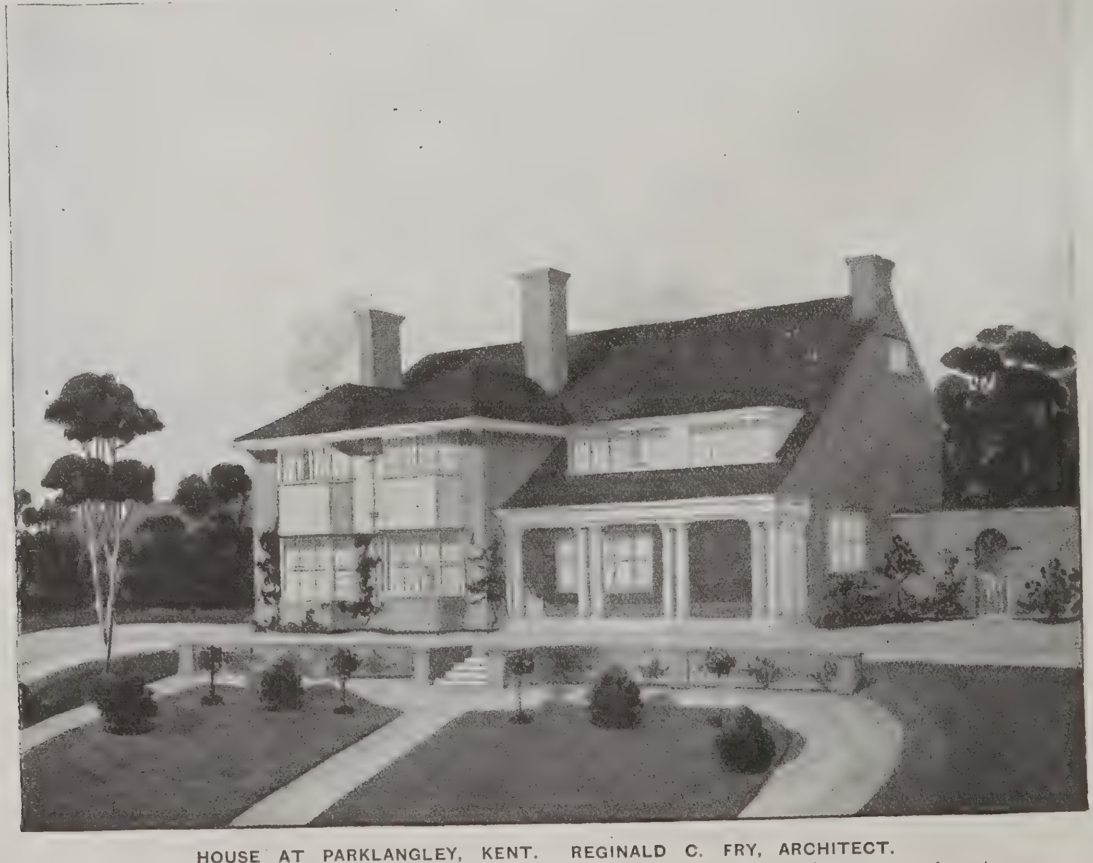
Sudeley must have been one of the finest baronial castles in this part of Gloucestershire. The original house was built in the reign of King Stephen, and rebuilt entirely in Henry VI.'s reign by the famous sea captain, Ralph, Lord Boteler of Sudeley. The ruins of the banqueting hall remain to show what a fine room it must have been, being on the first floor, and approached by a stone newel staircase. The windows at the ends and sides of the hall still remain, and the whole forms a splendid example of late Perpendicular work. The northern quadrangle has been restored by the Dent family, and at the same time the church, which dated from the middle of the fifteenth century, and adjoins the house on the east side, was also restored by Sir Gilbert Scott; it had been very much damaged by the Parliamentary forces in 1643, and had remained in a very neglected state. He also designed the tomb with the recumbent figure which is placed over the remains of Katherine Parr, and contains fragments of the old tomb with the lead coffin inside.

Charlton Abbots.

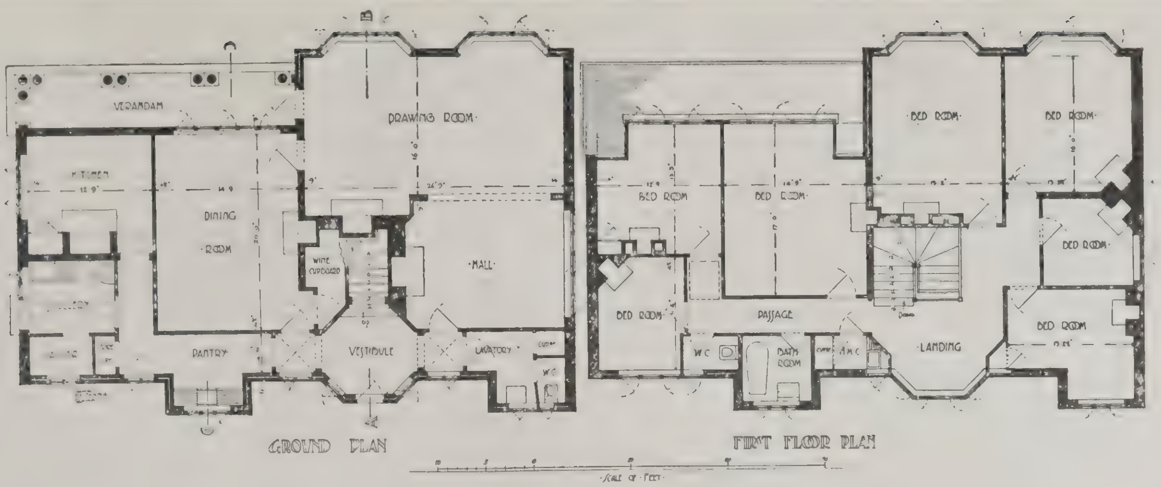
Two miles south of Sudeley Castle is Charlton Abbots, a fine Cotswold building with some later additions, and grouped round the house are the old farm buildings, including a large barn, the whole forming a very picturesque group on the slight slope of a hill. The house has three stories, and is roofed in a single span running east and west; there are three gables on the south side, and two on the north, the projecting portion on this side being evidently an addition—on the eastern side of the building is a two-storied square bay with the centre light 6ins. wider than the others. The most interesting feature internally is the staircase, 5ft. 6ins. wide, carried round a square newel wall of the same dimensions, and off each landing doors lead to the different rooms, the various levels of the different floors making the external elevations particularly interesting. In one of the first floor rooms, which is panelled and has a segmental ceiling, there is a seventeenth century carved oak chimneypiece, and in all probability the house was originally far richer in panelling than it is at the present day, as it has now been converted into a farmhouse. Near the house is a small church, and it is said that there used to exist in the village a lazar house belonging to the Abbey of Winchcombe, but at the present day no trace of it exists.

Sevenhampton Manorhouse and Church.

Leaving Charlton Abbots and going south another mile along the road is Sevenhampton, or, as it is often called locally, Sennington, which has a manor house with a church adjoining. The latter is a small cruciform building, with a central tower, transepts, and no aisles; the curious feature of the tower is that it is narrower than the nave, and is placed east of the crossing, so that the western piers stand free. These piers have been strengthened by flying buttresses placed diagonally inside the church from the piers of the tower to the corresponding angles of the nave and transepts. The tower, which is



HOUSE AT PARKLANGLEY, KENT. REGINALD C. FRY, ARCHITECT.
The walls are of grey plum-coloured bricks, while the upper portion and twin bays are rough-cast



HOUSE AT PARKLANGLEY, KENT. REGINALD C. FRY, ARCHITECT.

These plans are of the house shown on the opposite page.

lighted by windows above the roofs of the transepts, has a turret staircase on the south-east angle. The porch, which is on the south side, has a good door with a four-centred arch and pierced tracery head.

The dimensions of the church are interesting. The nave is only 13ft. 9ins. wide, and the total length of the church is 84ft. The internal dimensions of the tower are 10ft. by 9ft. 6ins. The greater part of the church is fifteenth century work, but the chancel is earlier, and has single lancet windows on the north and south sides; probably the south porch and the tower were built at the close of the fifteenth century. The east window is a three-light Perpendicular one, and probably replaced an earlier one of the thirteenth century. Between the north transept and the chancel is a passage which may also have served as a hagioscope, and the stone forming the roof of this passage is believed to have been an old altar stone, as there are traces of crosses on it. In the chancel also there is an old stone shelf which shows the height of the original altar; it is interesting, as it was not used to raise the altar above the floor level in the early days of the church.

The manor house, which is to the north-west of the church, is a seventeenth century building, but it has been very much modernised, both internally and externally, and the only old part is the back or eastern side. One of the windows in a room on the attic floor has a stone sill, with a stoop for holy water, and, as in earlier days the house was used as a retreat by the nuns from Sudeley Castle, the room may have been used as a chapel. An interesting feature of the out-buildings is the small four-gabled dovecote over the stables.

Whittington.

Another short walk will bring you to Whittington, which is only about five miles east of Cheltenham on the Oxford Road. The village is particularly picturesque, for most of the cottages have very small bay windows. The manor house is a typical specimen of the local architecture, but unfortunately the west wing has been pulled down and replaced by modern additions; the north or main elevation has three-pointed gables with windows, which still retain their original glazing. Like other houses in the neighbourhood, the most interesting feature internally is the open newel staircase, 5ft. 9ins. wide, which goes from basement to attic in a series of flights of seven steps each; at the top of the first flight is a quaint and original dog-gate—the whole staircase shows a prodigal use of timber, for the newels are 7½ins. square, and are continuous, but the turned posts on the top of each newel supporting the one above have been removed, the reason being, so it is said that sacks of corn might be the more easily carried up and down; the solid strings are 14ins. by 7½ins., and the hand-rails 6ins. by 6½ins., with 3½ins. turned balusters. The eastern end of the ground floor originally formed one room. The house contains some good stone chimneypieces, and several of the rooms are panelled. A corner lobby or tambour in one of the bedrooms has an angle pilaster with an Ionic capping treated in a noble but curious manner, for in order to solve the difficulty of the angle volute it is omitted altogether. Close to the house on the east side is the church, so close that at the north-west corner it is only 3ft. off. It is a picturesque though diminutive building, with several traces of Norman work, notably the north doorway, which is now blocked up. It consists of a nave and chancel 12ft. wide, with a south aisle, and a further aisle or chapel on the same side as wide as the nave and separated from it by an arcade. A timber bell turret, with a shingled roof, is placed over the junction of the nave and chancel roofs. In the south aisle are placed three recumbent monumental effigies in stone, which probably date from the early part of the fourteenth century, and are believed to have been brought from another church in the neighbourhood when it was pulled down. The figures are about 7ft. long. One is of a lady, and the other two represent knights, each with their legs crossed; in each case the armorial bearings are the same, and are believed to be those of the Crupe family, who resided at Whittington until the middle of the fourteenth century. In the chancel wall is a fragment of a tomb bearing the same arms. Fragments of very early work and some tiles from the old chancel are carefully preserved in the church, which was restored in 1872. In the churchyard at the east end of the church is the shaft of an old cross. The church and house were originally surrounded by a moat, traces of which still exist, and on the north-east are some very picturesque farm buildings.

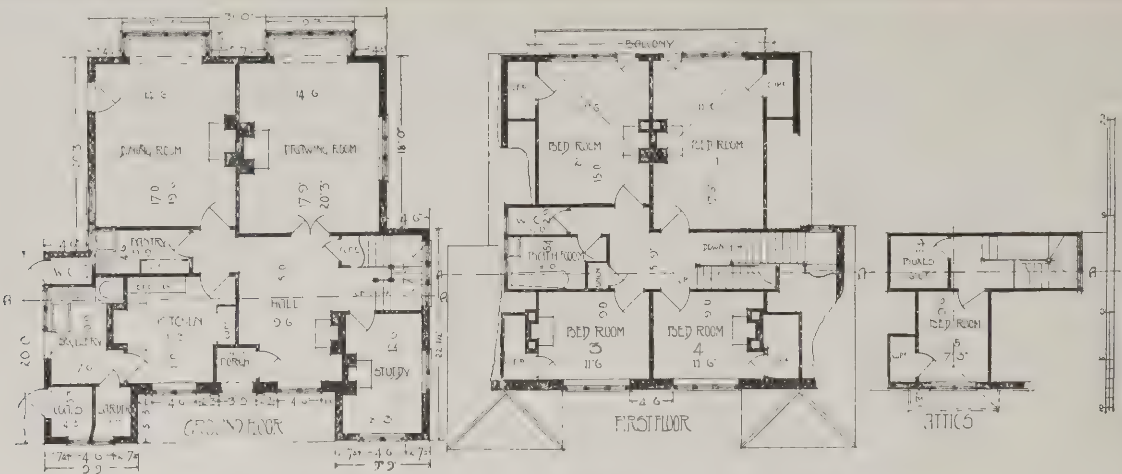
Chipping Norton.

Leaving Whittington and turning to the left off the main road to Chipping Norton, about 10 miles off is Upper Slaughter, a small village containing a fine old manor house and a church. The former is a most interesting building, mainly dating from the sixteenth century, but the basement is probably a couple of centuries earlier, and the two-storied porch is evidently a later addition. The house is situated on the edge of a hollow, there being a difference of about 9ft. between the level of the entrance courtyard and the basement—the house is L-shaped in plan, and the entrance front which faces west has four gables, the one above the porch being much smaller than the others, while the southern elevation, which has three gables, forms the arm of the L. The eastern or back elevation is perhaps the most picturesque, as the grouping and the design of the chimneys are particularly good. Internally there do not seem to have been any dividing walls, and evidently the house has been considerably altered at various times. In one of the rooms there are some good panelling and a fine stone chimneypiece—the house which has recently been occupied as a farmhouse is now being restored.

The church which is close by is an interesting structure of Transitional Norman work, and consists of a nave, western tower, and a chancel, with a stone bell turret surmounting the gable at the east end of the nave. The tower, which is square on plan and somewhat squat, is embattled, and has angle pinnacles, but the upper part is of a later date than the nave. On the south-east of the church is a group of small cottages recently restored by Mr. Lutyens. About 2 miles east of Upper Slaughter is a new house designed by Mr. Guy Dawber, called Netherswell Manor; it was originally built about five years ago, but it has recently been added to and, in fact, completely remodelled. The stables, farm buildings, kennels and engine-house, and the lay-out of the gardens and terraces have all been most carefully designed by the architect. The house is most beautifully situated, and commands some fine views.

Chasleton House.

Some nine miles further on the road between Chipping Norton and Moreton-in-the-Marsh is Chasleton House, perhaps the most interesting building in this district, for as it now appears it seems to belong to the seventeenth century, and everything about it suggests the Stuart period. As it was planned and designed in the reign of Charles I. so it has remained. It was built in 1603 by Walter Jones, a wealthy wool merchant of Witney. The property and original house belonged to the Catesby family, and it was the celebrated Robert Catesby, one of the Gunpowder Plot conspirators, who sold the property to Walter Jones, in all probability to raise money to carry out the plot. The house is a fine specimen of Jacobean work, being built on more formal and symmetrical lines than the other houses in the district. It is square on plan, with a small central courtyard. The entrance front is on the south, with two projecting square bays with no side lights on either side. The one on the left forms a porch, and the other is a bay to the dais of the hall. The staircases are placed in two central towers on the east and west fronts, and on the north side is a small square projecting bay in the centre of the elevation, the whole forming a very symmetrical plan. Externally the house is very imposing, being higher than usual, and the two staircase towers accentuate this. The rooms are full of interesting furniture and good tapestry, and the screen in the hall is a very fine example of Jacobean work. The great parlour at the north-east corner of the building is panelled, and has a fine chimneypiece; there are also several good chimney-



HOUSE AT PARKLANGLEY, KENT. REGINALD C. FRY, ARCHITECT.
These plans are of the house illustrated on the opposite page.

pieces in some of the other rooms. The house contains some good plaster ceilings, that of the long gallery, which has lately been restored, being particularly fine. This gallery, which runs the whole length of the northern front, is 70ft. long and 18ft. 6in. wide. About fifty years ago the house was re-roofed with Westmorland slates. From the top of the east staircase tower a very fine view can be obtained of the beautiful formal gardens below.

Chasleton Church.

On the south-east side of the house is the church dedicated to St. Mary. Part of it dates from the beginning of the twelfth century, Bardolph de Cestron building a church there on the site of an old British burying-place. It is a picturesque building, with a southern tower, the whole forming, with the house, a very pretty group. The church was restored in 1878, when the west-end gallery and high pews were removed, and the old three-decked pulpit, which bears the date 1629, was cut down and reduced in height. The oldest part of the church is the north door; the original tower of the church was destroyed by lightning, and the present one dates from the end of the seventeenth century. To the north-west of Chasleton is Moreton-in-the-Marsh, a very interesting town which time did not permit us to visit, but some ten miles further off in the same direction is Broadway, which has the reputation of being one of the most picturesque villages in this part of the country. The old church is dedicated to St. Eadburga, the granddaughter of King Alfred the Great, and dates from the middle of the twelfth century. It is cruciform in plan, with a plain central tower, the chancel and transepts being of a later date. The nave and aisles were originally covered with lead, but this being stolen, the remainder was taken off and sold about fifty years ago, and the present slate roof substituted. The font is peculiar, being very deep and circular, and entirely without ornament, and probably dates from the sixteenth century. In the north transept are stored the remains of a good Jacobean pulpit and sounding-board. There is also some good glass of the fifteenth century in the windows of the chancel and west end.

The church is some distance from the village, and consequently is very little used, as a modern church has been built which is more accessible. Adjoining the churchyard is Broadway Court, which has been recently added on to by Mr. Guy Dawber. The old house was formerly the residence of the Sheldon family, but the only part of it that is left is the old gateway, which has been utilised as a front entrance to the new house.

Abbots Grange.

One of the most interesting houses in Broadway is Abbots Grange, which formerly belonged to Pershore Abbey, and was built in the fourteenth century. This house has been so often sketched and measured that probably everyone is familiar with it. Considering that it has in turn been used as a village lock-up, a workhouse, and sub-divided into cottages, it has really suffered very little, and its present owner has very carefully preserved the old features of the house, and even the new studio which Mr. A. N. Prentice has lately added is built on the foundations of the old kitchens. Some of the windows show traces of the floors which had been inserted as they are filled in above the transoms. The hall, which has a good open timber roof, runs north and south, with the dais at the south end and the kitchens on the north. There is no trace of any fireplace, and if there was one in the centre of the room there is no sign of any exit for the smoke.

A curiously contrived staircase leads to the Abbot's solar, which has a squint which commands the kitchen door; this room also contains the remains of a fireplace, and has a good two-light window with reticulated tracery.

A Sixteenth Century Inn.

The Lygon Arms is another interesting house. This inn dates from the middle of the sixteenth century, and the entrance door bears the date 1620, and the names John and Ursula Trevis. For over 300 years the inn was known as the old White Hart, the name being changed when it came into the Lygon family at the beginning of the nineteenth century. Charles I. is supposed to have stayed there, and met Sheldon, one of his supporters, in the oak-panelled room, and Cromwell slept here before the battle of Worcester, probably occupying the room which now bears his name. This room has a fine enriched plaster ceiling and frieze.

Chipping Camden.

Passing through the villages of Willersley and Ashton-sub-Edge, both of them containing some very nice domestic work, you come to Chipping Camden, which is supposed to have derived its name from its being the meeting-place of the Saxon Kings, who, at the end of the seventh century, held a conference here about the war with Britons.

The church dedicated to St. James was built at the end of the fourteenth century, chiefly at the cost of William Grevel, the wool stapler. It is in the Decorated style, with a fine embattled tower at the west end 120ft. high, with massive buttresses and surmounted with twelve pinnacles. It has two side chapels, the one on the south side containing a fine monument to Sir Baptist Hicks, first Viscount Camden, who died in 1629. There are also monuments to the Noel family and some brasses, the earliest of which is to the memory of William Grevel, the supposed founder of the church, and his wife; he is described thereon as the "Flower of the Wool Merchants of England." The nave consists of five bays, and has an east window above the chancel arch. There is a tradition that the tower was built by the same builder as that of Gloucester Cathedral, for there is an old rhyme in existence which runs:—

"A man by the name of Bower built
Gloucester Cathedral and Camden Tower."

Near the church a fine mansion was erected by Sir Baptist Hicks at the end of the sixteenth century. It was destroyed by the General in command of the Royalist forces in the civil wars to prevent it from falling into the hands of Cromwell. Very little of the old manor house remains; it was built in the Italian style, and it was probably one of the most magnificent houses of the day, as it is stated that £30,000 was spent on it. Sir Baptist Hicks also built the row of picturesque almshouses near the church, and in 1627 the old market hall, which has a stone arcade and fine open timber roof, and forms the most noteworthy feature in the main street.

The old Wool Staplers' Hall is now used by Mr. C. R. Ashbee as a private residence. It has a curious oriel window which Mr. Ashbee explains was probably the result of rebuilding, in the sixteenth century, the original mediæval window, which had probably fallen. In the big room on the first floor there is a large open fireplace with the arms of the Calfe family in one of the spandrils. Its present owner has done much to preserve the original features of the house. Opposite this house is the one formerly occupied by William Grevel. It has two fine bay windows showing distinct traces of Flemish design.

Some few years ago the Guild of Handicrafts moved from London to Chipping Camden, and the old silk mill became their principal workshop.

Chosen.

Some three miles west of Cheltenham, on the way to Gloucester, is Churchdown, or Chosen, with its church standing right on the summit of a hill some 600ft. to 700ft. high. In all probability this hill served as a Roman signalling station. There is a quaint inscription on the tower recording that this "Belhows was Bvyldede in the yeere of ovr Lorde God 1601." Tradition says that this church served two villages, the one on the north being called Chosen and the one on the south Hucclecote. The inhabitants of the latter village appear to have been very jealous of the former, and it is said that they objected one Sunday to the text, "Make Thy Chosen people joyful," and indignantly asked, "What have the Hucclecote people done?"

(*To be concluded.*)

At Clevedon, Somerset, on October 9th, Mr. Thomas Henry Coles, late manager of the Bristol branch of John Russell and Co., Ltd., died, after a long period of ill-health. In July, 1908, Mr. Coles retired from active work, and was succeeded in his position by Mr. A. H. Sutton.

FIRE-RESISTING PROPERTIES OF VARIOUS BUILDING MATERIALS

Mr. Richard L. Humphrey, reporting upon tests made under his supervision at the Structural Materials Laboratories of the United States Geological Survey, St. Louis, states that the tests were made on thirty panels of various building materials. They were made with a furnace in the Underwriters' Laboratories, Chicago, Ill., to determine the effect of fire and subsequent quenching with water on mortar building blocks made of river and slag sands; common, hydraulic-pressed, and sand-lime brick; gravel, cinder, limestone, and granite concrete; glazed building and partition, terra cotta tiles, and limestone, sandstone, granite, and marble building stone. The mortar building blocks and the concrete were made in the structural materials testing laboratories; the other materials, except some of the common brick, were obtained in the open market at Chicago, Ill. The conditions under which the tests were made were unusually severe, and none of the material passed perfectly. The temperatures used would hardly be reached in an ordinary fire. The furnace has an arched opening, 6ft. by 9ft., in which the material to be tested is built as a wall, against the back of which a gas fire from the furnace is made to play. This wall is on rollers so that it can be run out of the furnace door into the open, where a stream of water can be thrown against it. There are provided pyrometers and thermocouples, by means of which temperatures on either side of the wall can be read at any time. In the tests the opening was carefully filled with the material to be tested, the furnace started, and continued for two hours, and then, except in five out of the 30 panels, the heated side quenched with a 5-minute application of 50lbs. per sq. inch of water coming through a ⅞-in. nozzle 20ft. from the panel. The temperatures varied between 1,400 degs. and 1,700 degs. F., maximum, most often the latter.

Much of the damage done to the building materials in this series of tests was occasioned by internal stresses, the gas flame heating one face of the test pieces much more rapidly than the other face. All the materials tested, including the hydraulic-pressed brick, cracked more or less. The concrete cracked least, but the tests indicate the necessity for using metal reinforcement in concrete walls to distribute the effect of the expansion.

A fact brought out most clearly by these tests is the low heat-transmission rate of Portland cement mortars and concretes. This is one of the desirable qualities in materials intended for fireproofing purposes. For marking the cement blocks linen tags were fastened by wire nails to the interior walls at the time of moulding. Most of these tags remained in place during the test, and when the walls were dismantled, the tags in every case were found entirely undamaged.

An average of all the tests shows that about 90 per cent. of the maximum temperatures attained by the faces of the panels were reached in one hour, while in the case of the mortar blocks the increase in temperature of the backs of the panels in one hour was only about 20 per cent. of the total increase in the two hours. Of the solid concrete panels the cinder concrete showed the smallest increase in the temperatures of the backs of the walls, and the granite concrete the largest. The total increase in the temperatures of the mortar panels was about the same as the total increase in the temperatures of the backs of the concrete, but the increase in one hour was somewhat greater in the case of concrete.

The damage done to the faces of the mortar and concrete panels would probably be caused at a temperature about half that of the maximum temperatures reached, owing to the water of crystallisation being driven from the mortar. This thin layer of dehydrated mortar may have formed a protective coating and prevented deep dehydration.

The backs of the brick panels also showed a small increase in temperature, but the natural building stones and the tiles proved poorer non-conductors of heat. The temperature of the back of a panel composed of plastered tiles increased to 128 degs. C. (262.4 degs. F.).

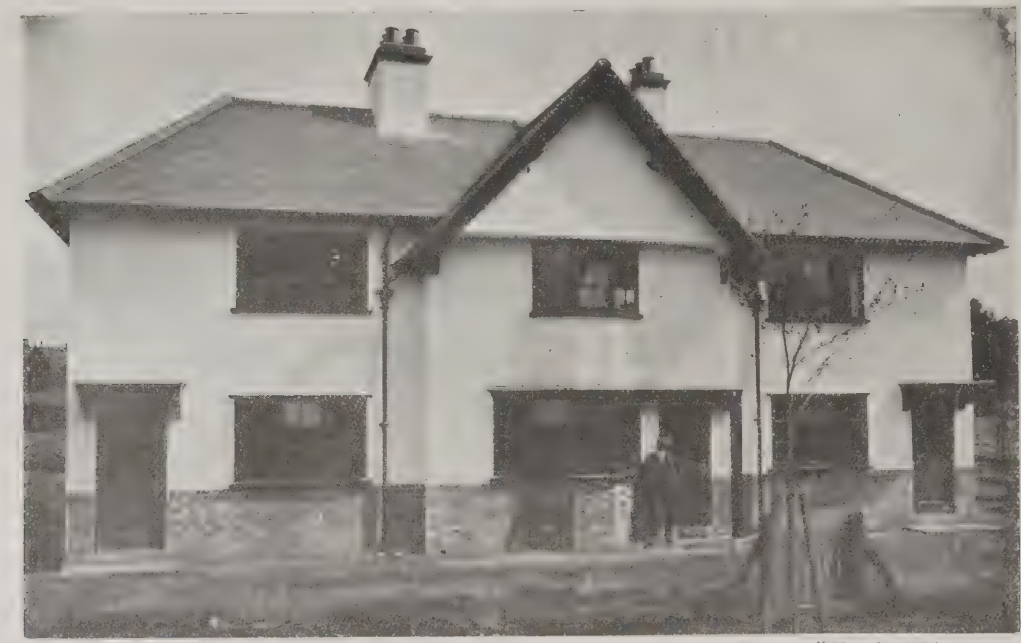
It is apparent that the strength of the webs of ordinary hollow blocks is insufficient to resist the stresses set up in these tests, as in many tests the rapid rise in temperature and the subsequent quenching of one of the faces of the blocks caused the webs to split. It was noticeable that the richer the mortars used in these blocks the better they withstood the tests. The amount of water used in mixing had a similar effect, the greatest percentage of water giving the best results.

When blocks were cracked or spalled before the application of the water, the damage appeared to be greater in the dry mixtures containing the greatest percentage of sand, and it was further observed during the fire test that the richer mixtures warmed up more slowly than the others. It is apparent that one of the causes of weakness in the hollow cement building blocks under these fire tests was the weakness of the concrete, a too dry and lean mixture, which, coupled with the thinness of the webs, provided insufficient strength to resist the stress due to the rapid expansion of the face. It was quite possible, as was shown in some of the block tests, to make blocks which will pass the conditions perfectly; the web must be thick enough to give the necessary strength.

It was difficult to determine whether the limestone, granite, gravel, or cinder concrete sustained the least damage. The faces of all the panels were more or less pitted by the fire and washed away by the stream of water. The test was unfair to the cinder concrete, as the cinder was very poor, containing a large percentage of unburned coal; however, the sample selected was the best of six or eight investigated in St. Louis. During the fire test the coal ignited and left the surface of the concrete very rough and badly pitted. The limestone aggregate in the face calcined, and the granite aggregate split and broke away from the surface mortar. The granite concrete probably behaved the best. The damage in no case extended deeply, probably not more than 1½ins. The evidence shows that even at this depth the temperature was comparatively low. The high stresses produced in the panels by the rapid rise of temperature of the faces while the backs remained cool caused cracks. On taking down the panels the blocks of concrete were found to be cracked vertically for some distance back from the face.

HOUSE AT PARKLANGLEY, KENT. REGINALD C. FRY, ARCHITECT.

The upper part is of warm yellow rough rough-cast, with green shutters, and the base and the two side bays are of soft-red coloured brick.



(*Photo: "Hereford Times."*)

COTTAGES AT THE HEREFORD GARDEN CITY. GROOM AND BETTINGTON, ARCHITECTS.

The serious damage to the various natural building stones precludes any comparison among them.

The tile tested was bought in the open market, and in one panel was taken from a lot of material about to be erected in a building. Large percentages of the faces of the tiles were washed away by the water, and the material composing the faces became soft and could be easily crumbled in the fingers. There was a comparatively rapid rise in the temperature of the back of the panels. The plaster on the panel of partition tile fell off a few minutes after the test was started.

The brick panels probably withstood the tests better than the other materials. The common brick tested comprised unused new Chicago brick, and used St. Louis brick. Fifty per cent. of the new bricks were split, while 60 to 70 per cent. of the old bricks were not damaged. Lime knots seemed to be responsible for most of the damage to the new bricks, as they were found at the bottom of nearly all the cracks. The bricks at the back of the panels were entirely unaffected. While the strength tests are not conclusive, there is apparently little difference in the strength of these bricks before and after firing.

The blocks in tests 1 to 10, inclusive, were made of sand dredged from Meramec River at Drake, Mo., and "typical Portland" cement. They were made in three different consistencies, damp, medium, and wet; and in three proportions, 1 : 2, 1 : 4, and 1 : 8. An equal number of each consistency made in the three proportions were tested in the same panel.

The concrete tested were pieces of broken beams that had been tested in the Government's structural materials testing laboratories at St. Louis, Mo. The pieces were 8ins. by 11ins. in cross section and of various lengths. They were fired with the 11-in. face exposed. In making the concretes, four distinct types of aggregates had been used—limestone, granite, gravel, and cinder. The aggregate was sized to pass a 1-in. screen and be retained on a ¼-in. screen. The concretes had been mixed in proportions of 1 of cement, 2 of Meramec River sand, and 4 of aggregate, and were of medium consistency.

Heretofore fire tests of building material have been made at random, and scarcely any two tests are comparable one with the other; it is, therefore, hoped that the next series of tests made in this type of furnace, where, with the experience gained, the conditions can be more closely controlled, will lead to much more valuable results.

Proposed New Works.

BRISTOL.—A scheme for the rejuvenation of the Bristol and Clifton Fine Arts Academy is shortly to be brought to the attention of prominent citizens, when the Lord Mayor will ask the approval of a plan to bring the society's galleries up to modern requirements. The building in Queen's Road will be substantially remodelled, to allow an entrance on the ground floor, and a fine salon leading to the galleries, and a large verandah on the floor above. The galleries will be extended, and provision made for studios and lecture-rooms for advanced Art, the whole change to entail a cost of some £10,000.

CARLSBAD.—Although considerable sums have been expended in the repair and decoration of the English Church at Carlsbad during recent years, the town architect and engineer have recently reported that large structural and drainage operations are urgently necessary, involving about £500.

DERBY.—After being further amended, the plans of the proposed new Hippodrome at Derby have been again considered by the Improvements Committee of the Corporation. On the last occasion the scheme was unsatisfactory owing to the height of the building, but by making certain alterations it is understood the difficulty has been overcome. Originally the building was to have been three storeys high, but now it will only be two, although the accommodation has not been greatly depleted.

LOUGHTON.—The following plans have been passed:—New drain, Loughton Lodge, Mr. Lomer; villa, Lower Park Road, Mr. G. Booth; re-building "Royal Oak," Messrs. Whitbread and Co.; house, Staples Road, Mr. Carter.

NOTTINGHAM.—A special meeting of the Nottingham City Council has been held for the purpose of dealing with the following resolution:—"That it be an instruction to the General Purposes Committee, and all other committees concerned, to limit the proposed widening of Carrington Street to a total width of 70ft., and that the negotiations with the trustees of the Collins Hospital Estate for the acquisition of land for the widening of the said street and of Greyfriar Gate, and the consequent promotion of a Bill in Parliament be conducted in accordance with the report of the Improvement Committee presented to the Council on February 3rd, 1908." The report referred to dealt with the scheme for widening Greyfriar Gate to 60ft., and Carrington Street to 70ft., the cost being £35,000. The debate in the Council, however, led to the decision being arrived at to widen Carrington Street to 80ft. and Greyfriar Gate to 70ft. at an additional cost of £7,000 or more.

PONTEFRACT.—The Town Council, in spite of pressure from the Board of Education, have been embarrassed for over six months as to the selection of a site for a new elementary school. At a recent meeting of the Council the Education Committee recommended the Friarwood site, and this again was rejected. Other sites were suggested, part of the Micklegate House estates and the old cricket field being included. Ultimately the whole question was again referred back.

WHITBY.—A sub-committee of the County Association have visited Whitby to inspect the equipment, etc., at the headquarters of the local Territorials, the Union Mills. The plans for new buildings, and the question of a suitable site were considered. The matter is to be laid before the County Association and the Army Council.

Falkirk Iron Company have removed from 67, Upper Thames Street, London, E.C., to Craven House, Kingsway, London, W.C. (Telephone: Gerrard 9482.)

* * *

A meeting of the Association of Midland Local Authorities has been held at Birmingham to consider the report in regard to the construction of a new main road from Wolverhampton to Birmingham. Alderman Cook, of Dudley, who presided, referred to the large amount of land lying waste in the Black Country. Such a scheme as that proposed would benefit the numerous districts lying on the route. Mr. G. H. Sankey explained that the proposal was to acquire land for the construction of six miles of new road and the widening of five miles of existing roads. The total cost was estimated at £76,136. The Chairman thought the case was one in which the Development Bill might help them, as the road was not only of local but of national importance. Some discussion followed, and eventually, on the motion of the Town Clerk of Wolverhampton, seconded by the Town Clerk of Walsall, a resolution was passed commending the scheme to the consideration of the local authorities in the districts concerned, and proposing that, subject to their approval, it be submitted to the Commissioners to be appointed under the Development Bill, should that measure become law.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Nov. 1.	TECHNICAL SCHOOL, KENDAL. The Corporation of the Borough of Kendal invite architects residing and practising in Westmorland to submit competitive designs, together with written descriptions and estimates, for the erection of a technical school in the borough. A premium of £15 is offered for the design considered by the Corporation first in order of merit, and further premiums of £10 and £5 respectively for those which are, in their opinion, second and third in order of merit; such designs, on payment of the promised premiums, shall become the absolute property of the Corporation. Particulars, etc., together with the plan of site, showing levels, etc., may be obtained free on application to the Borough Surveyor.
Nov. 1.	PRESTON GRAMMAR SCHOOL FOR BOYS. Preston Town Council invite competitive designs and plans from architects practising as principals, for a new grammar school for boys, to be erected in Moor Park Avenue, Preston, and estimates for the same. Premiums of £50, £30. and £20 are offered. The Corporation have appointed a professional assessor. Application to be made to Mr. Alfred Howarth, Town Clerk, Town Hall, Preston, and designs and plans must be sent in by 10 a.m. on Nov. 1.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: one guinea.
Nov. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea. Deposit returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly. Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Jan. 31 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle. Director of the Museums. City Hall, Cardiff.

Warrington Elementary School Competition.

The secretary of the Royal Institute of British architects desires us to announce for the information of architects proposing to take part in this competition, that the R.I.B.A. Competitions Committee are corresponding with the promoters with a view to the amendment of the conditions of this competition.

Fire Prevention Notes.

The Fires of Negligence. Speaking of fires in general, Dr. Waldo said, at the inquest held with respect to a fire that occurred last month at London Wall, E.C., that he frequently found that fires in the City of London were due to gross negligence, and that a revision of the law might prevent a lot of unnecessary fires. At present, for instance, it is no offence to throw down a light, unless, at the same time, a felony, such as burglary, is being committed. He was of opinion that culpable carelessness, short of arson, should be made a punishable offence at law. With this, drastic though it may seem, we cannot but concur. Offences of far less serious consequences are made penal. We have advocated, and we should have preferred, the education of the people in the minor arts of fire-prevention. But, even if such education were rendered very complete, and were spread to the utmost extent, there would still remain a large number of criminally careless persons, whom only the sharpest lessons—those consequent upon violation of statute law—would bring to a just sense of their obligations to the community. A very large proportion of the total number of fires of unascertained origin no doubt arise from undisciplined habits, such as the careless throw-down of matches and of cigarette ends. Gross negligence was not alleged with regard to the fire under notice. The outbreak was traced to some warm ashes which had been left in a lift.

Fires and Fees. Inadequate realisation of our obligations with regard to fire prevention is again made evident in some observations that were made by Mr. Christopher W. Surrey, district surveyor for the western division of the City of London, and by Dr. Waldo, the coroner. Mr. Surrey had made a survey of the burnt premises; but, judging from former experiences, he will probably have considerable difficulty in extracting his fees from the London County Council. The Coroner, commenting on Mr. Surrey's position in the matter, said that he (Dr. Waldo) had had a similar difficulty when he was appointed coroner for Southwark. He was unable to get any money until he appealed to the Home Office, who then allowed him at the rate of 6s. 8d. per inquest, whilst other London coroners were paid at the rate of 30s. per inquest! If Dr. Waldo gets no more than 6s. 8d. for inquiring into the causes of a serious fire, if 6s. 8d. is the measure of the Home Office conception of the importance of such inquiries, and if the L.C.C. values the

THE FIRE AT A HOP WAREHOUSE IN SOUTHWARK. PULLING DOWN THE WALLS.

This fire was somewhat remarkable inasmuch as it was left to burn out.

fire surveyor's services at stark naught, it is pretty plain that our public authorities have but a feeble sense of their responsibilities with regard to fire prevention.

Match-boarding. The recommendations of the jury on the London Wall fire deserve more than casual notice, because they admit of pretty general application. "They considered that the premises were not adequately provided with means of escape in case of fire; and they strongly recommended that all businesses of a dangerous nature should have no matchboarding to the walls or lifts." It is to the latter recommendation that we would draw particular attention. This should be more than a recommendation. It should be a legally imposed obligation. The persistency with which building owners adhere to dangerous materials is sufficiently marked to warrant legal enactment compelling the adoption of fire-resisting materials, if not in all buildings, then certainly in buildings which, like the premises under notice, are to house inflammable goods. The building in London Wall was in the occupation of a firm of wholesale milliners, and it was stated that many of the articles used there in the manufacture of ladies' hats were highly inflammable, some containing celluloid. Yet, apparently, matchboarding was used for lining some of the walls! Unfortunately, there is no novelty in this condition; and yet the lesson of frequent fires is not sufficiently impressive to prevent its constant repetition. It is fairly clear that nothing short of legal compulsion will cause the general adoption of fire-resisting materials. It is not as if such materials were unavailable. They exist in abundance, and as they are not exorbitantly dear, there does not seem to be any valid excuse for imperilling life and property by failing to adopt them.

French Fire Prevention Committee. The three days' meeting of the French Fire Brigades Federation recently held at Caen, is likely to be fruitful of result. At the business meeting held under the chairmanship of M. Chéron, Under-Secretary of State for the Navy, Mr. Edwin O. Sachs, who attended by special invitation, read a paper in French on the working of the British Fire Prevention Committee in this country, and the safeguards that have been adopted at its suggestion. After some discussion, it was unanimously decided that a special commission should be formed with a view of organising a similar committee in France in connection with the French Federation, and M. Lepine, Police President in Paris, consented to act as chairman of this commission. Among the matters touched on in the course of the discussion were the great loss incurred by the navy from fire, amounting to something like 69,000,000 francs in a short period of years, also protection of small children from danger of fire, by the prohibition of dangerous flannelette, the compulsory use of fireguards, and the like.

Cement and Brick. Commenting on the report of fire tests of various building materials conducted by Mr. Richard L. Humphrey, of the U.S. Geological Survey, the editor of the "Cement Age" very naturally assumes that the results are encouraging to manufacturers and users of cement. About the only competitor concrete has in the way of a fire-resisting material is brick, and even its efficiency as applied to building construction must depend upon sound Portland cement mortar. In other words, a brick, considered as a clay unit, is not prone to disintegrate under extreme heat; but even with that fact established, or admitting, for argument's sake, that brick is infinitely superior to concrete, there would still be no occasion to fear serious competition on that score. Concrete lends itself to fireproof construction in many ways that make it more desirable than brick from both mechanical and economical standpoints, as, for example, in the construction of columns, beams, floors, etc. In an ordinary conflagration, concrete, the writer claims, offers superior advantages from the standpoint of slow heat penetration and protection to the vital parts of a structure. When it comes to the matter of cheap repairs, no material compares with it. A matter of great importance brought out by these tests is the statement that it is quite possible to make concrete blocks which will pass the conditions perfectly. This should be noted by blockmakers as affording opportunity to put that industry on a better basis. Rich mixtures, the use of plenty of water, and an increase in the thickness of the web, are the essential requirements of a fireproof concrete block as determined by these experiments. Apart from brick, the writer concludes, which is not as economical or satisfactory as concrete for the reasons given above, no other material, according to the government tests, stands upon an equality with it, the various building stones and hollow tiles disintegrating rapidly under the stress of fire and water.

THE FIRE AT THE HOP WAREHOUSE IN SOUTHWARK.

The fire, as mentioned on the preceding page, was allowed to burn itself out, owing to the danger of the hops swelling and bursting the walls if the hose had been turned on them.

Mr. Leonard Stokes, F.R.I.B.A., having been appointed to act as assessor in the competition for the proposed Town Hall and Municipal Offices, Johannesburg, South Africa, will embark on December 11th.

* * *

Messrs. E. A. Roome and Co., builders and contractors, of 36, Basinghall Street, E.C., have secured the contract for the erection of a country house and stables at Ashtead. The architects are Messrs. Whitfield and Thomas.

* * *

We are informed that Mr. Thomas Athey, formerly manager of Messrs. Spencer, Santo and Co., has joined the staff of the British Uralite Company at 16, St. Helens Place, E.C. Mr. Athey's extensive practical experience of all matters appertaining to building operations will be at the service of the company's clients in estimating for the erection of buildings constructed of its various fireproof materials. The company has an extensive connection with the various Government Departments, and with most municipal bodies, which it is believed the foregoing arrangement will tend to extend.

Works in Progress and Completed.

CARDIFF.—The plans of the proposed temperance institute and swimming baths at Clarence Road, which were prepared by Mr. E. W. M. Corbett, F.R.I.B.A., architect, have been approved of. The institute, which will really be a substitute for the present building, is estimated to cost about £8,000 or £10,000, and will provide accommodation for about 2,000 members.

DONCASTER.—The extension of the Doncaster Cattle Market which has just been opened, has been carried out at a cost of about £11,000, of which £6,933 has been paid for property, the remaining £3,000 being expended in the erection of a new sale ring and pens for cattle, paving, etc.

DONCASTER.—The Education Committee have accepted the tender of Mr. J. T. Wright, of Leeds, amounting to £12,733, for the erection of a new High School for Girls, which is to be built on the site of Chequer House. The architects are Messrs. J. M. Bottomley, Son, and Wellburn, of Leeds.

DUNBLANE.—The new institute which has just been opened, consists of billiard-room, library, reading-room, etc. The cost, amounting to over £2,000, was raised by subscriptions. The architects are Messrs. Davidson and Son, of Coatbridge.

GARTH, MAESTEG.—The new Workmen's Hall and Institute, which was opened recently, provides on the ground floor a large hall to accommodate about 500 people, with retiring rooms, etc., as well as a large billiard-hall. On the first floor are a reading-room, library, club-room, etc. The work has been carried out by Mr. W. Lewis, Maesteg, from plans prepared by and under the superintendence of Mr. W. Beddoe Rees, architect, 3, Dumfries Place, Cardiff.

HAMILTON.—We published recently some particulars concerning the new Baptist Church which has been erected here. We are now able to give some additional information. The church buildings occupy a commanding site on rising ground The church has been placed with main gable and entrance fronting Kept Street, the hall build-

THE EFFECT OF FIRE ON EXPOSED GIRDERS. *Photo: Bolak.*
This girder was red-hot for over an hour in the fire at the premises of Messrs. McCorquodale & Co., Ltd.

ings and offices fronting New Street. The main doorway to church enters into the front vestibule, from which there is access to church and galleries. There are transepts at pulpit end, and the apse is formed so as to accommodate an organ. Accommodation for 630 persons is provided. The baptistry is placed in the apse, and is specially planned in relation to retiring rooms. The large hall is seated for 462 persons, including the back gallery. A lesser hall, seated for 133 persons, has been placed at the side of the large hall, having folding partitions, so as to be easily added to the large hall, making the combined accommodation 600. Ample provision is made for heating, lighting, and ventilation on the most approved methods. The church and halls are provided with handsome open timber roofs, and the windows are glazed with leaded glass. The walls are of red stone, and the roofs are slated with green slates, having red tile ridges. The style of architecture is late fifteenth century Gothic. The total cost of the building is £5,200. The architects are Messrs. Miller and Black, F.R.I.B.A., I.A., 58, Renfield Street, Glasgow.

HOYLAND.—The recently opened adult school has been erected at a cost of £2,000. Mr. J. W. Wilson is the architect.

KING'S LYNN.—The parish church of Gaywood, King's Lynn, an ancient structure with remains of Saxon and Norman work, has undergone considerable restoration and extension under the direction of Mr. W. D. Caröe. The chancel has been restored and refitted, and an oak reredos, the work of Mr. N. Hitch, has been erected by the rector, the Rev. H. S. Radcliffe, as a memorial to his father; the east window, the work of Messrs. Powell, of Whitefriars, has been placed in memory of the late Sir David Radcliffe, of Liverpool, by members of his family, and the erection of a vestry, organ chamber, and south chapel and the restoration of the transepts have been carried out by public subscription. A sum of £2,500 is still required to complete the work arranged for by the architects' plans.

LIVERPOOL.—Mr. Gilbert Scott, the architect of the new cathedral, has submitted to the cathedral committee the designs of the chapter house which the Freemasons of West Lancashire have decided to erect, at a cost of £10,000, in memory of the late Lord Lathom.

LONDON.—Owing to the ever-increasing demand for their celebrated productions, the well-known house of Messrs. L. and C. Hardtmuth have decided to erect in Kingsway a building worthy of the magnitude of their business. This will be commenced shortly from the designs of Mr. J. S. Gibson, of 5, Old Bond Street, the builder being Mr. Jas. Carmichael, of Wandsworth. It is needless to add that Messrs. L. and C. Hardtmuth are the well-known manufacturers of pencils, including the celebrated Koh-i-Noor, besides being the sole European representatives for Waterman's Ideal Fountain Pens. The building will bear the appropriate title of "Koh-i-Noor House."

LONDON.—To provide work for the unemployed, a scheme has been prepared for renovating the south and west fronts of the Alexandra Palace. The total cost of the work is estimated at £4,370.

LONDON.—Rapid progress is being made with the scheme for re-erecting Crosby Hall at Chelsea; the houses in Danvers Street have been demolished, and already the contractors have excavated 20ft. of the foundations for the new hall. The work of erecting the building is expected to commence shortly, and the new stonework to take the place of the rubble walls, is being carefully prepared.

LONDON.— The new subway which has been constructed for pedestrians from the north-west corner of Blackfriars Bridge to Queen Victoria Street, with spurs going east and west to opposite the District Railway station and the Royal Hotel respectively, will shortly be opened. The cost has been £30,000.

MANCHESTER.—The Manchester University new chemical laboratories which have been designed by Mr. Paul Waterhouse, F.R.I.B.A., were recently opened by Sir Henry E. Roscoe, Lord Morley presiding at the ceremony in his capacity of Chancellor of the University. The new buildings form the completion of the south-western corner of the western court, as they touch the medical school buildings, being built up against their southern wall. Mr. Waterhouse has kept the design of the building facing the smaller court studiously plain. In the elevations which face the large quadrangle he has endeavoured to produce a result in harmony with the adjoining design of his late father, Mr. Alfred Waterhouse, R.A. The walls are faced with buff bricks, and the window dressings, copings, strings, and other stone work are of Stanton Woodhouse stone. The work has been carried out by Messrs. George Macfarlane and Son, contractors, Manchester, and superintended by Mr. L. Knowles.

MITCHAM, SURREY.—The foundation stone of the new church about to be erected in the Mitcham Lane for the district of St. James', Streatham, which contains an increasing population of over 8,000 souls, has just been laid. The accommodation to be provided is for 723, and the cost will be £4,522.

NEW SOUTHGATE.—The foundation stone of Christ Church Congregational Church, New Southgate, was laid on October 9th. The design is in late Gothic. Bath stone is being used for the dressings, pressed red bricks for the facings, and pitchpine for the joinery. The contract has been let for £4,597, to Mr. Jas. W. Jerram, Crown Works, East Ham, E.; the architects are Messrs. George Baines and Son, 5, Clements Inn, Strand, W.C.

PINNER.—The foundation stones of a new Baptist Church which is to accommodate about 500 worshippers, and which is estimated to cost, exclusive of site, about £4,300, were laid recently. The church has been designed in late Gothic style, and the plan is in the form of a Latin cross. Messrs. Spalding, Spalding and Myers, A.R.I.B.A., of Watford and London, are the architects, and Messrs. Brightman and Son, of Watford, the contractors.

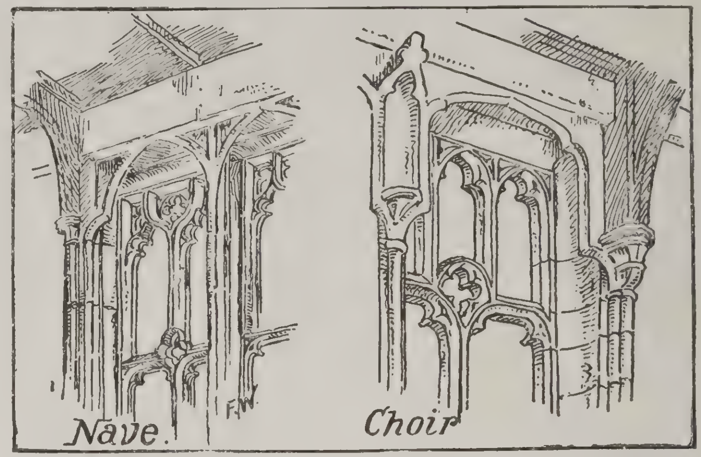
Photo: Bolak.
THE EFFECT OF FIRE ON IRON WINDOW FRAMES.
Another illustration from the fire at the premises of Messrs. McCorquodale & Co., Ltd.

TRURO.—The Truro Cathedral Building Committee have reported that the dedication of the towers, with their spires and the bells, is likely to take place on May 20, 1910. With the completion of the towers and spires, and the provision of the bells, the Cathedral church as such, will be completed, but there will remain the erection of the Chapter House and the cloister court.

WOLVERHAMPTON.—The new swimming baths, Wolverhampton, and the extensions to the Wolverhampton Town Hall, which are under the supervision of Mr. Geo. Green, the Borough Surveyor, are now approaching completion. The whole of the reinforced fire-resisting floors on both these works, including the wood block flooring at the Town Hall, are being carried out by Messrs. Homan and Rodgers, Manchester.

WORCESTER.—The foundation-stone of a new church which is being erected for St. Martin's parish, Worcester, from the designs of Mr. G. H. Fellowes Prynne, F.R.I.B.A., was laid recently. The church, which will accommodate 650 adults, will involve a sum of £4,650 in its building.

WRECCLESHAM.—At Wrecclesham, a little village of under 2,000 inhabitants, near Farnham, new Church schools have been erected at a cost of £3,518.



CLERESTORY WINDOWS, CHURCH OF ST. JOHN THE BAPTIST, COVENTRY. (From "The Churches of Coventry.")

THE CHURCHES OF COVENTRY.*

A most interesting addition to Messrs. George Bell and Sons' excellent "Cathedral Series" is "The Churches of Coventry." To say that it is one of the best of the cycle is to accord it high praise. The "Spires of Coventry" as almost world-famous; and, as Sir William Dugdale has said, the place is "remarkable for antiquity, charters, rights, and privileges, and favours shown by monarchs." Indeed, as the author of this volume has found to his advantage, the unusual fulness of the archives, the accounts and records of its guilds and companies, and the close connection of these with the church, supplies a larger body of information than is often at the disposal of the historian of a parish. Chief among the churches, both architecturally and historically, is St. Michael's, whose special glory is its steeple, the height of which—300ft.—is about equal to the length of the church. The only other parish church having a steeple of equal height is that of Louth, Lincolnshire, and the only English cathedral spires exceeding it are those of Salisbury and Norwich; and the Coventry tower exceeds in richness of design that of any other parish church. The nave, which is 37ft. 6ins. wide in the clear exceeds, in this respect, many cathedrals. It is of six bays, and is 54ft. high in the centre, while each arch is 20ft. wide in the clear. The oldest existing portion of the church is the large south porch, of which the date is not later than 1300. The other buildings or remains dealt with are the churches of Holy Trinity and St. John the Baptist, the Grey Friars' Convent, the White Friars, St. Mary Hall, and the Carthusian Monastery. The book is well produced, and contains forty illustrations, from which we are permitted to reproduce the four here shown.

NEW UNIVERSITY COLLEGE OF SOUTH WALES.

The New University College of South Wales and Monmouthshire, which was opened recently, stands on a site of five acres, the gift of the city, valued at £20,000. Of the proposed buildings only the arts department, the library, and the administrative block have been erected. The expenditure on these has been £130,000, and the total amount to be ultimately spent will be £260,000. The buildings occupy a fine position in the park, and have a beautiful outlook on extensive ornamental gardens and King Edward's and Museum Avenues, which are lined with trees. The facade of the college is decorated with designs representing

the arts and sciences, and the arms of the presidents of the college, past and present, and the arms of Wales and divisions of Wales. One enters into an extensive vestibule, at the further end of which is a finely executed statue by Mr. W. Goscombe John, R.A., of the late Principal Viriamu Jones, first principal of the college. The grand staircase is constructed of alabaster from the Rhetian rocks at Penarth. From the balcony in front a fine view of the park is to be had. The library, to the erection of which the Drapers' Company made a gift of £16,000, is surmounted with a semi-circular roof, and three large windows at one end bear the arms respectively of the Prince of Wales, the Drapers' Company, and the college. It has space for 100,000 volumes, and is lighted in the main from the roof. Until the great hall is erected the library will serve for large meetings. A narrow gallery 100ft. long has been specially constructed for optical experiments. All the interior woodwork is of American white wood or fumed oak. The outer walls of the building are of Portland stone. When the whole scheme is completed the buildings will be symmetrically grouped round a great court, larger than Tom Quad, Christ Church, the largest quad in Oxford. In designing the buildings, the architect (Mr. W. D. Caröe) says that he "had in mind the many delightful classical and semi-classical examples in both our ancient Universities, and has endeavoured to give a flavour to the building which, while being distinctly modern and of its time, is intended to recall some of the feeling which is so characteristic of that typically British, and at the same time scholarly, architectural development."

Our Plate.

Women's Hostel, Birmingham.

The building was completed some months ago and occupies a site in close proximity to the new University. The building has been erected as a residence for the lady students attending the University. About sixty bed sitting rooms are provided, with wardens, private rooms, and office, large common room, library, and dining room. The floors and staircases are of fireproof construction. The buildings are faced with black country bricks and dressings of mottled Hollington stone. The roofs are covered with Westmorland green slates. The general contractors for the work were Messrs. Richard Fenwick, Ltd., who also carried out the reinforced concrete work to floors on the Coignet system. The heating was executed by Messrs. Ashwell and Nesbit, of Leicester. The architects are Messrs. Buckland and Haywood-Farmer, of Birmingham.

Village in the Elan Valley.

The illustrations show some of the buildings which have recently been erected by the Birmingham Corporation in the Elan Valley, near Rhayader, South Wales, in connection with their water scheme, and provide accommodation for the workpeople engaged upon the work in connection with the reservoirs and filter beds. The school buildings take the place of the structure which was removed to make way for the works in connection with the construction of the reservoirs. The village occupies a site which was at one time covered by wooden huts accommodating nearly 2,000 workmen at one time engaged upon the engineering work. The new buildings are constructed of rubble of local stone, with dressings of a hard grit stone, and the roofs of green slates. The contractors were Messrs. Henry Lovatt, Ltd., of Wolverhampton, and the architects are Messrs. Buckland and Haywood-Farmer, of Birmingham.

The London County Council was recommended by the Fire Brigade Committee, on yesterday's agenda, to appoint Lieutenant Henry Spencer, R.N., as Assistant Divisional Officer of the Fire Brigade. Other names submitted were those of Engineer-Lieutenant P. J. King, R.N., and Mr. E. G. French.

Enquiries Answered.

The Portico of the Pantheon.

STAFFORDSHIRE. — NEWCASTLE writes: "I send tracing (not reproduced) from Spiers' Orders, of capital to antae of the portico of the Pantheon. Kindly explain why the mould of the abacus is not of the same section throughout as is that of the columns. The circles xx on tracing are not concentric. The mould at the angle appears narrow on plan, and seems to widen as it approaches the centre of the capital. Also, why are the antae fluted and not the columns, as I understand they were of coloured marble? As the columns and antae were not made for the Pantheon, were they all obtained from the same place?"

—The illustrations to the Orders are reproduced from Normand's Parallels, published in 1829, which have never been contraverted. The column and its capital constituted part of the peristyle of Agrippa's temple, built probably about 27 B.C., and were re-erected after the completion of the Pantheon by Hadrian in 124 A.D. The antae are part of the latter, consequently the abaci are of two different periods, and Hadrian's architect decided not to make the curves of the upper and lower edge of the abacus concentric. The antae of the portico are in marble and fluted; the columns are monoliths in polished granite, which accounts for their not being fluted.

R. PHENE SPIERS.

Book on Reinforced Concrete Formulæ.

LIVERPOOL.—E. B. G. writes: "Please let me know whether there is any hand-book of reasonable size dealing with reinforced concrete formulæ, on the same lines as, say, Molesworth, for ordinary engineering calculative rules?"

—Marsh and Dunn's "Manual of Reinforced Concrete" (Constable, 7s 6d.) would no doubt suit our correspondent's purpose.

Reinforced Concrete Flooring.

In renewing the floor of a 1st floor barrack block, one floor high, it was discovered that the binder was rotten and must be renewed. Some Kahn bars being spare from another job, it is proposed to make a reinforced concrete beam with these bars, to support joists and floor. The old joists are to be used again. The walls of the building are 18in. thick, built with lime mortar, and are fairly old. The space is 22ft. × 21ft., but, owing to openings in walls, the beam must be built 14ft. 6in. from one end. Will you please say what you consider the size for this beam? These Kahn bars are ¾in. thick, and are long enough for stirrups of bars to tension from centre of span."

—The larger slabs need to be 7ins. thick, with ¾in. Kahn bars placed at 16in. centres, and in the smaller slab at 24in. centres in 4in. thickness, while the beam should be 15in. deep × 20in. wide over all depth from top of floor, and embedded in same 2in. from the bottom there should be No. 8—¾in. Kahn bars. In the floor slabs the bars may be only placed about ½in. above the soffit.

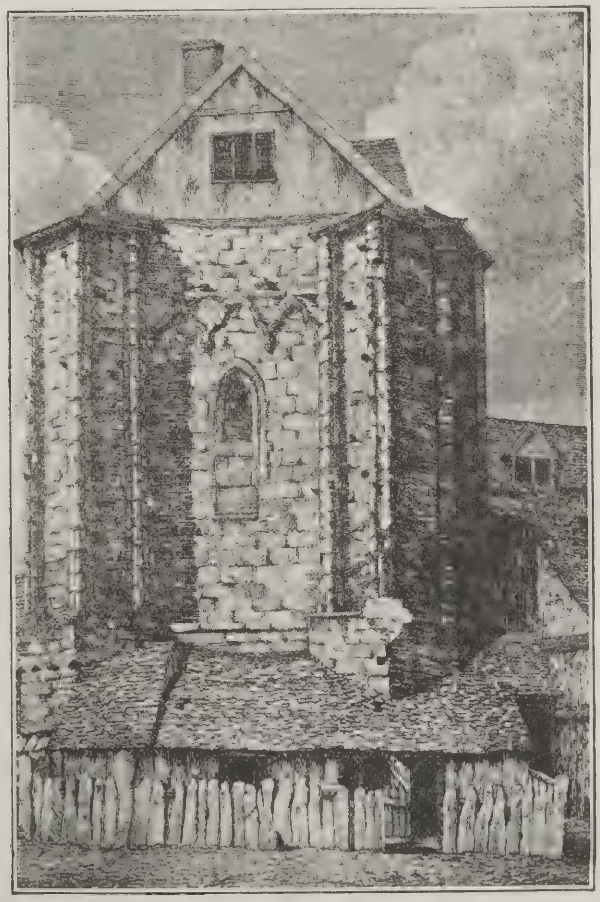
Taking-off Quantities.

ST. HELENS.—A. W. writes: "Please show how the quantities should be taken out for the work shown in the accompanying sheet of drawings [not reproduced]."

—The correct dimensions for the deductions of brickwork and facings for the window opening shown are as follows:—

4 0 1 Bk. deduct and
7 0 Deduct Ex. to red brick facing.

It is the custom, when dealing with these arches, to deduct only up to the springing of the arch, with semi-circular Gothic pointed or even with segmental arches, having a very considerable rise, the nett area of the void would be taken. The dimension I give is, however, correct in this instance.



REMAINS OF THE NORTH-WEST TOWER OF THE PRIORY AND CATHEDRAL CHURCH, COVENTRY. (From "The Churches of Coventry.")

SOUTH-WEST DOORWAY, ST. MICHAEL'S CHURCH, COVENTRY.
(From "The Churches of Coventry.")

The space occupied by the sill is not deducted from the common brickwork, nor is the face area of the sill deducted from the facings—the sill is only shown two courses high; if it were three or four courses high it would be correct to make the deductions.

It is customary to make the deductions for openings in two dimensions—one for the external reveal, which I presume we are taking now, and another for the internal reveal, the external reveals being deep. There is the facing to them to be measured as under:

2/ 9 Add Red Bk. facings (reveals).
7 0

Then as regards the arch:—

4 3 Centre to segmental aperture.
9

4 3
4 9
2)9 0
4 6

4 6 Extra on Common Brickwork to neatly axed segmental arches in red bricks set in cement and pointed to match facing.
1 1 and
Deduct Ex. to red Bk. facings.

4 3 Add Arch as above (soffit)
9 and
Clean off soffit of arches after pointing centres.

2/1 1 Fair skewback cutting in red Bks.

4 9
2/1 1 2 2
6 11

4 9 Fair circular cutting in do.

Cuttings measured by the foot run are assumed to be only 4½in. from the face of the wall—in this case we have 9in. to make up—therefore add,

6 11
4½ Rough cutting.

Assuming that you do not intend to measure the labours on the stonework, you are practically correct. A better description would be however:—

16 6 String 10ins. × 8½ins. weathered, moulded, girth, and dentilled.

2/ 1 Labour only to working mitres, returned end to weathered, moulded, girth, and dentilled string.

Assuming that the stone is jointed each side of the pilaster caps, the correct description is:—

6/ 1 Pilaster caps 1ft. 9ins. on face, 1ft. 1in. on bed, and 10ins. high; weathered, moulded, girth and dentilled on face, and two short returns with internal and external mitre to each return.

The correct size of the stack shown is 3ft. 4½ins. × 2ft. 7½ins. (unless the bricks used are larger than London stocks), and the following dimensions give the quantities of the cap:—

3 4½
Mean projection. 2/3 6
3 10½

2/3 11
1 6
2/2 8 } ⅓ B add.
1 6

3 4½
2 7½
6 0
2 0
12 0
Add
8/3 2 0
14 0

14 0 Add Extra to red brick facings:—
1 6 (face of cap)

6 0
2 0
12 0
4/3 1 0
13 0

2/13 0 Add facing as last (top and bottom of cap).
3

8/14 0 Oversail one course facings.

This is the correct method, and follows the usual custom, which is to measure the length by the height by the average projection for the common brickwork, and the length by the girth for the facings, measuring in addition all oversailing and moulded courses as "extra on facings."

½/16 6 1½ B. Gable and
8 3 Ex. to Red Bk. facings.

2/12 6 1½ B. add for back of verge.
9

9
4½
1 1½

2/12 6 ⅓ B. add for oversail.
9

2/12 6 Extra to red brick facing (girth
1 1½ of verge).

And I should, in this case, take the oversailing in one dimension (as follows):—

2/12 6 Extra on facings to plain oversailing verge, 3 courses deep, set all headers in cement.

1 Cutting apex untie to do.

2/12 6 Fair raking cutting in facings.

2/12 6 Rough cutting.
9

A. G. C.

A correspondent travelling in the West of England reports that, in consequence of the strike in Sweden, many lines of timber are in short supply, and prices rule higher. Stocks of red deals are lighter than they had been for some time, and quotations have grown correspondingly firmer. He further reports that supplies of slates are inadequate to the demand, and that there is difficulty in obtaining some of the favourite sizes. Local cement merchants complain that outside firms are offering cement at prices barely equal to cost, thus compelling local firms to reduce to unprofitable rates.

* * *

About 20 members of the Newcastle Society of Antiquaries assembled at Gilsland for the last country meeting of the season, the object being to view the excavations which have been carried out there under the superintendence of Mr. F. Gerald Simpson and Mr. J. P. Gibson. The site of the excavations, according to popular Arthurian legend always called the "King's Stables," is in reality that of a mile castle, which was slightly excavated in 1886. Mr. Simpson said the structure, the largest of its kind yet known on the line of the wall, was 80ft. square. These mile castles, as the name given to them betokens, existed at intervals of about a mile right along the wall, projecting from its south face. They had gates in their northern and southern faces and thus formed guarded passageways through the great barrier. The bolt holes in the centre of the massive gateways just unearthed show where the gates fastened. These gateways, a springer stone of one of which was discovered, had been half-walled up in later Roman times. Remains of buildings discovered within mile castles have hitherto been very fragmentary, but in that at Gilsland the foundations of two structures run along almost the entire east and west sides, occupying about half the area of the castle, and are of the same date. Any doubt that might have existed as to whether the Wall and mile castles were contemporaneous is put at rest by these excavations, as the two have been found to be bonded together. Objects of interest found include coins, pieces of plate armour, two carved gems from rings, fibulæ, pieces of pottery, including Samian ware, etc.

LEEDS CONFERENCE OF SECRETARIES FEDERATION OF BUILDING TRADES EMPLOYERS.)

At the annual Conference of Secretaries of the National Federation of Building Trades Employers of Great Britain and Ireland, which was held on Tuesday, Oct. 19th, at the Hotel Metropole, King Street, Leeds, Mr. Ernest J. Brown, President of the National Federation, took the chair, and the following gentlemen signed the muster-roll:—J. C. Addyman, Barnoldswick; Fred. W. Amphlet, Midland Centre; Geo. Astwood, Burnley; W. J. Barton, Nottingham; J. Cameron, Edinburgh; A. W. Chamberlain, Burton-on-Trent; T. Costigan, London; W. C. Creasor, Stockton-on-Tees; J. Davidson, Leeds; Edward Dean, Oldham; J. Denton, Barnsley; James Denver, Manchester; S. A. Dove, Leicester; Councillor England, Barnsley; John R. Hadaway, North Shields; J. Hague, York; Robt. Hall, Bury; Percy Hastings, London ("Builders' Journal"); W. H. Hope, Sunderland; Bertram B. Moss, Liverpool; A. Peers, Hull; Richard Richards, Newport (Mon.); Walter Rigby, Middlesbrough-on-Tees; J. G. Robertson, South Shields; Wilton A. Rycroft; Thos. Smith, Sheffield; John E. Sykes, Huddersfield; W. R. Thompson, Dewsbury; J. R. Vose, Bolton; and A. G. White, National Secretary. Apologies for non-attendance were intimated from:—J. Baker, Barrow-in-Furness; W. Bullen, Liverpool; H. Duerden, Longridge; S. Easten, Newcastle-on-Tyne; W. J. Forsdike, Sheffield; F. Grundy, Loughborough; R. Hollows, Wigan; W. Knowles, Grimsby; G. Macfarlane, Manchester; H. Oldham, Rochdale; W. Pollock, Kilmarnock; J. F. Reid, Lancaster; J. Tomlison, Preston; J. Tonge, Loughborough; and J. Wilkie, Dundee.

The President (Mr. E. J. Brown) said in his opening address, that he was glad to visit (for the first time) the celebrated city of Leeds, which was so easily accessible that he had hoped for an even bigger meeting than that which had assembled to discuss Federation affairs from the secretarial point of view. He was exceedingly glad to have the honour of presiding at a meeting of secretaries, because he realised very clearly that the secretaries have to bear the brunt of the work of their respective centres or associations, and that upon the manner in which that work is done the success of the Federation largely depends. He was very specially proud of those secretaries who are doing excellent work under difficulties. The work is comparatively easy and pleasant where the builders of the district are loyal and united; but he (the President) was very well aware of the disheartening effect of working under the opposite conditions. He and the secretary had engaged in missionary work in certain unorganised districts, and the truth was then forcibly borne in upon him that it is impossible to form and sustain organisation where there are no leaders, and that it is almost impossible to exaggerate the extent to which the organisation of a district depends on the energy and enthusiasm of the secretary. It was necessary for the secretary to have plenty of enthusiasm. Without it he would not be able to overcome the apathy and indifference that are so fatal to combination. The secretary must have full confidence (as the President has) that the Federation is going to be an increasingly powerful factor in industrial and economic issues that are of national importance. Even London is gradually coming round to this view. It had been found very difficult to persuade London builders that the Federation could be of any use to them; but he (the President) was glad to report that the interest London is now taking in the Federation is increasing every day. During his term of office as President, there had been but little trouble in the trade. He had enjoyed a year of peace, but by no means a year of inactivity. The Federation had been setting its house in order, and in particular had succeeded in establishing working rules and conditions that are likely to prove of immense value. Being now a considerable distance North, he took the opportunity of expressing his admiration for the high degree of organisation to which the North had attained. As a striking instance—rather astonishing to one accustomed to the somewhat invertebrate South—the builders of the North were solid in the determination not to tender for a job unless the quantities are provided. Here again London is backward, but that it is not altogether indifferent to the question, may be inferred from the fact [chronicled in last week's Journal] that a meeting of professional gentlemen had been held, at which the subject had been discussed at considerable length, and an important resolution was passed. It was a matter in which secretaries might do valuable work by maintaining and insisting upon the firm attitude that had been adopted in the North and in the Midlands. He was afraid that secretaries do not obtain much kudos for the work they do; but he was, nevertheless, sure that it was highly appreciated by the Federation. He looked forward hopefully to the time when funds will be more plentiful and secretaries better rewarded. Referring to "my own pet scheme"—the adoption of an official journal—the President felt that he need not dilate on that subject, as he had brought down from London with him Mr. Hastings, who would place before them some perfectly irresistible arguments. He (the President) felt that before sitting down he, being amongst secretaries, could not refrain from bearing witness to the excellent and heartwhole manner in which the National Secretary, Mr. A. G. White, does his work. The National Secretary was a model for all.

He then asked Mr. Percy Hastings to read a paper on "The Use, Interest, and Influence of the Official Journal." At the conclusion, Mr. A. G. White moved a hearty vote of thanks to Mr. Hastings for coming from London to Leeds, at the National Secretary's request, to read so important and valuable a paper as that to which they had just had the pleasure of listening. Mr. White again called attention to the first paragraph in the report issued by the Journal Committee, and presented and adopted at the last half-yearly general meeting. The paragraph is as follows:—"1. The Committee fully appreciate the valuable subscription support already accorded, but feel that it is essential to the prestige of the Federation and its branches that the Official Journal should be received and read by every member in every Association, therefore they are very desirous that the excellent plan adopted at Newcastle and Sunderland of purchasing the paper on wholesale terms and distributing it to every member, arranging their Association subscription so as to cover the cost, should be generally adopted as being the true way to make a big success of our Official Journal." There could be no question, Mr. White thought, that this recommendation showed the best way of extending the effective influence of the Journal, but how far the advice is practicable remains to be seen. This, however, is really a question of the Federation making good an undertaking into which it has entered. Now, said Mr. White, when a local association enters into an agreement with a trade union of operatives, it does so in the full intention, and with the fullest confidence, that every one of its members will honourably observe in both letter and spirit the terms of such agreement. The operative union in a similar manner relies upon its members to observe the agreement. Both sides rely entirely on the personal honour of their members to fulfil their obligations, and we all know that, speaking broadly, experience shows that such reliance is not misplaced. Further, relying entirely upon the personal honour of members, Federations have entered into conciliation schemes. In an exactly similar way this Federation has entered into an agreement with the "Builders' Journal," which thereby became our official journal. As to its material side, the agreement was based on the mutual benefit which would be likely to accrue to the parties through, on the one hand, the great increase of subscribers which the Federation undertook to do its best to secure, and, on the other, the increased advertisement revenue which the adhesion of the Federation membership was expected to make possible. Over and above the material side of the matter, the main object of the whole affair was to be able to say that our official journal spoke for, and voiced the opinion of 5,000 to 6,000 firms, representing the most responsible and the most honourable firms in all branches of this great industry, so that an influence might be created which would help to prevent, ameliorate, or remedy grievances of all kinds. The honour and the reputation of the Federation are pledged to secure a subscription from practically every member of it, or the objects which were to be obtained will not be obtained, and the whole agreement will not be kept. The honour of the Federation is the honour of every member of it, and therefore it is the duty of every member, be he general contractor or sub-contractor, be he personally interested in the subject matter of the journal or not, to do his part by subscribing for it, so that the Federation may make good its undertaking. "In my opinion," said Mr. White, "this question will be a test of the capacity of the Federation for practical work on a National scale, and upon its result will largely depend its future usefulness. It is evident that if the members fail to back up their representatives in a question like this, any future questions will be prejudiced by the failure, and that the representatives, in consequence, will hesitate to undertake any reforms requiring the support of the membership for their effective carrying out. If members realise that loyal support of their journal is a question of honour, there will be not the slightest difficulty in getting them to act accordingly."

Mr. Thos. Smith (Sheffield) seconded the motion. He thought the suggestions contained at the end of Mr. Hastings's paper were very businesslike.

The Chairman, in supporting the resolution, said that he hoped that secretaries and members would realise that they have a powerful organ to support their interests, and that they would make every legitimate use of it.

Mr. E. Dean (Oldham) made a practical suggestion as to a method of subscribing.

Mr. J. G. Robertson (South Shields) spoke enthusiastically of the value and interest of the Journal. "It is," he said, "a live Journal. It voices our opinions, and gives us information that we cannot get elsewhere."

The vote of thanks having been carried with acclamation,

Mr. Percy Hastings briefly returned thanks.

Mr. Thos. Smith (Sheffield) then read a paper on "The Mixed Clauses for dealing with Conciliation and Disputes which exist in Working Rules as Survivals from a period anterior to the National Scheme of Conciliation." The resolution which he proposed was as follows:—"That in view of the fact that the Conciliation Boards and the antecedary committee therein referred to, provide, or should provide, machinery for dealing with all disputes or questions which may conceivably arise between employers and operatives, it is desirable that, in all districts where Conciliation Boards have been established, that joint conferences should be held with the object of abrogating such existing working rules as provide alternate methods of settling disputes, but having regard always to existing provisions for dealing with disputes as provided in existing working rules, and also to the length of notice which either party may demand in specifically important matters."

The Chairman remarked that this was the longest resolution he had ever had to put. It was seconded by Mr. W. H. Hope, who said that within his own experience the supposed clashing, or apparent conflict, between association rules and the rules of the Conciliation Board, had created difficulties, the association rules being sometimes in need of interpretation in the light of the conciliation rules. He suggested, however, that as the meeting had not had an opportunity of reading and digesting Mr. Smith's paper [which had not been prepared in time for printing with the others], discussion on it should be adjourned.

Mr. Bertram B. Moss (Liverpool) said that to his mind the Conciliation rules were well-nigh perfect; but he was afraid that, in the nature of things, it was impossible that association rules and working rules could be made equally clear and definitive. If they could be made as perfect as Mr. Smith seemed to desire, there would probably be no need for Conciliation rules.

Mr. A. W. Chamberlain (Burton-on-Trent) said that his association had asked the operatives to consider the advisability of deleting some of the old rules in favour of new ones recognising and bearing reference to the Conciliation rules.

Mr. J. Davidson (Leeds) said that he had strongly advised his association not to abrogate existing local rules. To do so would be to destroy the machinery that was best adapted for the settlement of local disputes. There were so many peculiarities of local circumstances in various districts, that he thought any attempt to bring local rules into precise conformity with any set of general rules would be most undesirable. Indeed, in some instances that could be easily imagined, the effect might be absolutely disastrous.

Mr. Thos. Smith said that the idea in his mind was that the various rules should not be in conflict, and he certainly thought that this surely very desirable object could be attained without producing the disastrous consequences imagined by Mr. Davidson. Mr. Smith did not mean that working rules should be superseded by Conciliation rules, but that the respective rules should be brought into substantial and reasonable agreement, and not cross each other as they were apt to do when working rules had not been really brought up to date, but represented more or less perplexing survivals of a period prior to the National scheme of conciliation. All that he advocated was some uniformity of standard.

Mr. Edward Dean (Oldham) then read his paper on "Rules for Conciliation Boards."

Mr. Moss, answering Mr. Dean's question, "When does a dispute arise?" contended that a dispute does not arise until there is an absolute difference of opinion between the parties, and that before this condition is reached it is often possible to arrive at agreement without going to the Conciliation Board. As to Mr. Dean's contention that the Conciliation rules should include instructions as to how any party or parties failing to abide by a decision should be dealt with by the local association, Mr. Moss thought that the pains and penalties were wisely left undefined. Such matters were best left to the discretion of the association. The offence of the recalcitrant party might be either very serious or very trivial, and therefore any hard-and-fast rule as to what should be done to the rebel was unadvisable.

Mr. Davidson expressed the opinion that a dispute arises as soon as discussion of a matter is formally requested. With regard to the resolution proposed by Mr. Dean, to the effect that the conference should recommend the Federation to amend certain rules for the establishment and governance of Conciliation Boards, Mr. Davidson thought it unwise to put forward such general propositions without advancing cogent and specific reasons. He did not think that sufficiently cogent reasons had been advanced to justify the meeting in passing the resolution.

Mr. Fred W. Amphlet (Midland Centre) thought that most of the points that had been raised in both papers were frivolous. With regard to Mr. Smith's general contention, Mr. Amphlet was of opinion that instead of elaborating working rules, it would be far more convenient to consider them as being subsidiary to the machinery for settlement that was provided by the Conciliation rules. With respect to Mr. Dean's recommendation as to Rule 6—that in case of failure to agree, the seven days allowed for appealing to the National Board is insufficient, the speaker thought that, seeing the desirability of geting disputes settled as quickly as possible, the period allowed was ample. As to Mr. Dean's complaint that Rule 13 does not include instructions that amendments may be moved to a proposition on the actual dispute, he thought that closer examination would convince Mr. Dean that the rules as to procedure provide for amendments. He thought, indeed, that the rules generally were ample for all purposes, and that therefore Mr. Dean's resolution was superfluous.

Mr. Smith explained that for his part he had by no means contended that more disputes should be thrown on to the overworked hands of the Conciliation Boards; but, at the same time, he contended that inefficient working rules should not be employed for settling and finishing disputes.

Mr. Moss agreed that if any revision was necessary, it was the local rules that required to be altered, in order to bring them into line.

Mr. Dean said that actual disagreements having arisen upon the points he had raised, he certainly thought it necessary to seek from the National Federation enlightenment on points that had been found to be somewhat obscure.

Mr. Moss: Surely it is a reflection on our intelligence to ask the National Federation to interpret the rules.

Votes of thanks to Mr. Smith and Mr. Dean having been carried with applause, it was resolved that the discussion of Mr. Smith's resolution should be resumed at the next conference of secretaries, Mr. Dean having withdrawn his resolution.

Mr. A. G. White's short paper on the working of conciliation boards having been, at his request, taken as read,

Mr. W. H. Hope remarked that this paper, like everything that the National secretary undertakes, is carefully and thoroughly and philosophically thought out. He was a well-spring of wise counsel; and it had come within Mr. Hope's experience that the statesmanlike advice proceeding from the National secretary had created, in the minds of local authorities, a great respect for the National Federation.

Mr. Fred. W. Amphlet, adding his tribute to the value of Mr. White's paper, said that, in his experience, representatives of the operatives were too apt to go to the Board with their minds made up before hearing the evidence. Both parties should go into conference with unbiassed minds, prepared to do their best in the interests of the industry.

Mr. W. H. Hope (Sunderland) read a paper (which had not been printed, but which we shall be glad to publish when space allows), on the subject of sub-contracts. It was supplementary to the valuable paper on a builder's general contract, which was read by Mr. Hope at the preceding conference.

At the conclusion of the paper, the Chairman said that he should like to have the pleasure of proposing a vote of thanks to Mr. Hope, to whom he almost felt himself to be under a personal obligation, because it happened that the ideas thrown out by Mr. Hope would be of great service to him (the chairman), as they no doubt would be to many others who had heard them.

Mr. W. R. Thompson (Dewsbury) had much pleasure in seconding the vote and in endorsing the observations of the chairman. He was sure that Mr. Hope's elucidation of the subject would be of great benefit to the industry, because, as most of those present were aware, Mr. Hope had made a special study of the subject. He might be allowed to mention that in Yorkshire they had a useful form of sub-contract which owed much of its success to the valuable suggestions that had been made by Mr. Hope, to whom it had been submitted for revision. With regard to Mr. Hope's recommendation that accident insurance policies should be taken out in the joint names of the contractor and his sub-contractors, Mr. Thompson hardly thought it necesary, or in all cases expedient, to have a joint policy.

Mr. Hope, in reply, said that it was above all things necessary "to insure that the man is insured," to make insurance doubly sure. In the absence of the safeguard he had suggested, the contractor could never be certain that the sub-contractor's policy had not been allowed to lapse.

Mr. James Cameron (Edinburgh), when invited to read his paper entitled "Past Conferences—some Impressions," said that as the paper had been printed, and as time was pressing, he would ask that the paper should be taken as read. He would like to suggest that proofs of the papers to be read at future conferences should be posted to those who intended to be present at the meetings, so that the matters brought forward for discussion could be properly digested.

Mr. A. G. White said that there was no question as to the desirability of doing what Mr. Cameron had suggested. The difficulty was that it was impossible to know, many days in advance, who was coming to the conference. To send proofs to all who were entitled to be present would involve unnecessary expense, as most, if not all, the papers would ultimately be seen in the official journal.

The Chairman thanked Mr. Cameron for the trouble he had taken in writing his excellent paper, which would certainly be read with interest.

Mr. W. J. Barton (Nottingham) asked that his "Note on the Inter-trading Rule" should be taken as read, but the Chairman said that as it was so very short, the meeting would no doubt prefer that Mr. Barton should read it. Mr. Barton's paper is as follows:—

A NOTE ON THE INTER-TRADING RULE.

I have felt for some time that the inter-trading rule as recommended by the National Federation is too strict according to the present wording, and thus causes unnecessary opposition to its acceptance in many quarters, especially from the sub-trades.

Also from what I can learn, where the rule is in use, it is not enforced as drafted, but modifications are allowed to the members.

Now, would it not be better to have a rule which avoids opposition as far as possible, and also more nearly accords with the actual practice?

The second paragraph of the rule appears to be all right, but my objection is to the first paragraph, which bars members from giving or taking *tenders* to or from an outsider.

Sub-contractors especially resent this, and say they cannot consent to their opportunities of obtaining business being thus curtailed.

I understand that in practice, a member is allowed to give or take tenders to or from anyone, but must endeavour to induce the persons to join an association before entering into a contract for the work for which he has tendered.

In order to obtain the opinion of my fellow secretaries on this point, I propose (if the chairman consents) putting the following resolution:—

"This Conference of Secretaries of Building Trades Associations recommends that the first paragraph of the inter-trading rule should read as follows:—*Inter-trading.*—Members shall not enter into contracts with or otherwise employ or deal with regular employers in the building trades unless such employers are members of this or a kindred Association affiliated to the National Federation of Building Trade Employers."

P.S.—On sending the above to Mr. White, he kindly wrote me pointing out a weak point in my remarks, namely, that a tender might be converted into a contract by simple acceptance and stamping the offer. To meet this objection, I suggest that sub-tenders should contain a note to the effect that "This estimate (should it be accepted) is subject to a written contract, containing all usual and proper terms, including compliance with the inter-trading rule of the Building

Trades Association of this district, being signed by the parties, and shall not be taken as in itself constituting a contract."

Mr. Amphlet commented on the difficulty of enforcing any rules upon the subject that might be thought too stringent.

Mr. Smith said that the Sheffield rule was not quite so strong. On the wall calendar issued by the associations there was a notification to the effect that builders are not expected to give or take tenders from those who are not members of the association.

Mr. A. G. White thought that the weak point about Mr. Barton's suggestion was that probably contractors could not always be relied on to insert it in their conditions.

Mr. A. W. Chamberlain approved of the suggestion.

Mr. Moss said that he was strongly opposed to any sudden or violent enforcement of the inter-trading rule, because it was likely to do more harm than good by scaring away those who might be susceptible to a more gradual approach. The object should be to show the advantages of the rule—members should be educated up to it.

Mr. Cameron said that the attitude advised by Mr. Moss was precisely that which was being adopted in Edinburgh. The practice was there introduced as a recommendation, and in that form it was undoubtedly doing a certain amount of good.

The Chairman said that Mr. Barton would no doubt see the wisdom of Mr. Moss's advice. At present it would be better if each association acted within its own discretion.

Mr. T. Costigan (London) did not feel at liberty to say—and in fact he was not in a position to state definitely—what was the attitude of London with regard to the inter-trading rule.

Mr. A. W. Thompson, president of the Yorkshire Federation, read a short paper [which we hope to print in a future issue] on "The Position of the Sub-trades in Various Towns as Regards Membership of the Builders' Association," in which he urged the importance of doing all that is possible to bring in the sub-traders—who sometimes have organisations of their own, and are sometimes unorganised—so as to bring about consolidation into one strong and united body that shall represent all sections of the industry.

Mr. Moss was grateful for Mr. Thompson's paper, because it was evident that the National Federation had not paid a sufficient amount of attention to the sub-trades. He suggested that Mr. White should send to secretaries a circular requesting information as to the position of the sub-trades in each district, and as to the best means of bringing them all into the National Federation.

Mr. Amphlet pointed out a difficulty with regard to associations that, possessing but fifteen or twenty members, were apt to be feeble and inert.

Mr. Thompson said that the difficulty might be overcome by grouping small towns together.

The Chairman remarked that he had heard Mr. Thompson's paper with great pleasure, and was glad to say that London was beginning to put its house in order in the way indicated. It was one of its ambitions to get traders and merchants into the association.

Mr. A. G. White asked that his paper on "Building Trade Organisation in France" [part of which was printed in last week's journal], might be taken as read. It was, he thought, desirable to know what builders are doing in the sister country. The Federation had sent him to France, and he was glad of this opportunity of showing that the expenses of the journey were not thrown away. [See next column.]

Mr. Chairman thought that international inter-communication was both pleasant and profitable. It had been found so in the case of our friends the Belgians, with whom very charming visits had been interchanged. Mr. White's paper contained a great deal of valuable information, and was in itself a complete justification of his visit.

Mr. E. Dean read a paper on "A National Insurance Scheme," in which he raised the question of the desirability of suggesting to the Council the creation of a National scheme for insurance of members against all the usual risks.

Mr. Hope thought that such a scheme was beyond the scope of the Federation, and was almost equivalent to the municipal trading that was held in such abhorrence by the Federation.

Mr. Amphlet could not admit the validity of Mr. Hope's comparison. In the Midlands the associations had launched a scheme which gave a clean policy without undue restrictions, and at remarkably low rates; and he saw no reason why the movement should not become national.

Mr. Davidson thought it should be possible to devise some practicable means of placing insurance on a national basis, on the lines not of municipal trading but of collective bargaining. In Yorkshire the rates would have been much higher but for combination of interests. He suggested the adjournment of the discussion.

Mr. Dean, replying, said that his idea was not that of collective bargaining, but of amalgamation of the various offices; yet even collective bargaining would be better than vacillation between the various offices.

Mr. White supported the proposal for adjournment, which was adopted.

Mr. J. R. Vose (Bolton) introduced some business of a semi-private character, upon which he sought and obtained the advice and experience of his fellow-secretaries.

Mr. Moss then made a proposition with regard to the means of distributing the official organ. This having been carried unanimously, a hearty vote of thanks was accorded to the chairman, who, in acknowledging it, said that his visit to Leeds would always be to him a very pleasant remembrance.

It was decided, on the proposition of Mr. Hall, seconded by Mr. Dean, that the next conference should be held at Manchester.

At the conclusion of the conference, the visitors were entertained to tea at the invitation of the Yorkshire Federation, to whom Mr. E. J. Brown tendered the thanks of the guests for a splendid example of the hospitality for which Yorkshire is renowned the world over. Mr. Thompson briefly replied.

[A report of the meeting, somewhat amplified, and including all the papers read or presented at the meeting, is being prepared for distribution in separate form. Most of the papers will also appear in due course, as room can be found for them, in the pages of the "Builders' Journal." Any corrections required should be sent to the National secretary.]

BUILDING TRADE ORGANISATION IN FRANCE.*

By A. G. White.

(Concluded from page 305, *No.* 767.)

The workmen also boldly declare war against the State, they say: "Thus the working class does not confine its action to struggling directly against employers, it struggles also, and always directly, that is to say without recourse to parliamentary action and the system of participation in the work of government by means of representatives, against the State which is the defender of the employer class, and its obliged supporter. So the workers' action, besides the assault it makes against the power of the State, with the object of causing it to retreat, aims at the same time at diminishing its oppressive power until it disappears entirely." Their eventual aim is stated to be a "general strike," which shall make the workers masters of the situation, and enable them to establish a Communistic State. They say that then, "the cohesive centres will be the corporate federations and syndicates of workers, who will carry on all useful functions now devolving on the public and communal authorities." The expropriation of the capitalist class is to follow.

Such is the programme publicly announced by the larger part of the working classes in France, including those in the building trade. Is it to be wondered at that the employers have been very busy the last few years forming defensive syndicates and federations, and that they have a total membership of over 20,000?

(For an independent contribution which confirms the foregoing definition of the objects of the French Unions (or some of them), see the "Contemporary Review" for June, 1909.)

The continual rise in wages due to these agitations has of course brought about an increase in the cost of materials for building.

In the face of these facts, the isolated employer was helpless, the ordinary employers' association could do nothing to resist the increased cost of production. Not being companies or corporations they could not enter into contracts, and had to submit to the demands of the merchants for higher prices. In consequence of this situation, they formed the Professional Association aforesaid, which under the company law would enjoy full liberty of action.

The Association's programme is stated to be:—

1. To make contracts with furnishers of materials.
2. To re-organise their workmen.
3. To establish general works fitted with the requisite mechanical appliances for masonry work.
4. To study and put into operation mechanical appliances for transport, hoisting and setting all materials.
5. The utilisation of material acquired and stored in common.
6. The regulation of the output of its members.

"These various combinations are intended to diminish, as far as practicable, the general expenses, regulate the cost of materials, save hand labour by means of all kinds of labour-saving devices, in order to make good, wholly or in part, the increased cost of labour, and the various other charges which have been imposed on industry." Part of this programme is already in course of realisation, viz., items 1 and 3.

Workmen's Organisations in France.

I have no data for any exhaustive review of the workmen's organisations, but the following facts extracted from a report by M. Leon de Seilhac, permanent delegate of the Social Museum, together with the preceding particulars, which, though given by the Employers' Association, are by them quoted from workmen's publications, will give some idea of the position.

The General Federation of Workers is composed of labour exchanges and of federations.

Labour exchanges exist in every industrial town, and appear to fulfil a similar function to what are called Trades Councils in England. Federations of a single trade or industry are as yet few in number. The most important are "The National Syndicate" of the railway employees having 45,590 members, the Building Federation with 40,000, the Textile Workers' Federation with 20,000, the Miners' Federation with 30,000, the Metal Workers' Federation with 14,000, the Mechanics' Federation with 5,000, the Tobacco Workers with 9,000, the Leather and Skin Workers with 8,000, and the Printing and Bookbinding with 10,000.

The federations of the building, metal, and leather trades are revolutionary in their character and objects, and object to accumulate large funds; indeed, they reproach the English Trade Unions for having too much money.

---

*Concluding portion of a paper presented by Mr. A. G. White, National Secretary, at the annual Conference of Secretaries of the National Federation of Building Trades Employers of Great Britain and Ireland, held at the Hotel Metropole, King Street, Leeds, on October 19th.

The remainder are reformers, have accumulated funds, and are careful and prudent in their policy.

A contest is in progress for ascendency between the two groups just mentioned.

The revolutionary federations are seeking to overwhelm the reforming federations by sheer numbers, and by insisting on methods of representation and organisation which will tend to absorb the latter in the former.

There are other phases of the struggle, such as the attitude of workers to the militarism of the Continent and their tendency to an anti-patriotic attitude, but these do not interest us much.

The chief factor of interest to us is that the revolutionary character of the building trades unions profoundly influences their point of view towards their employers, and is responsible for the unreasonable way in which they insist on an immediate concession of ameliorations which have only been secured step by step in this country, regardless of the dislocating effect which violent changes in hours of work and rates of pay, such as they demand, cannot fail to have on the prosperity of the industry by which they live. The majority apparently entirely fail to see the potent effect of a big bank balance in securing objects. One of the delegates, M. Coupat, told his confrères, "Pay high contributions. The question of big funds is important. You reproach foreign workmen with having too much money, but if money does not count, don't turn to them so often for help. It is because of money that the English workmen have a 54-hour week since 1871. They would not have obtained such results if they had only had infected communist pots like those I have had regret in seeing."

Again he says: "The workers in the same town pay small contributions to their syndicate, but pay large ones to the Societies for Mutual Help, which exist under the aegis of the employers. There is a million of workers who go to the Mutual Help Societies for what they cannot find in their syndicates—viz., out of work benefit and sick benefit."

It is evident that the character and functions of trades unions in France, especially in the building trade, is very different from and we must think inferior to those we know over here.

In connection with this matter, the following particulars are given by the Board of Trade Gazette for July, 1909:—

Number of unions of the building trade in France, 826.

Membership of same, 87,423.

Proportion of members to total employed in the trade (1901 census), 16.40 per cent.

Workmen's Compensation in France.

The following, taken from pamphlets issued by the Building Trades Employers' Associations in Paris, will give some idea of what French legislation in regard to workmen's compensation has brought about in that country.

The object sought by the makers of the law governing workmen's compensation is apparently fully attained, the wide interpretation given to the words, "by reason of or in connection with work," by the Court of Appeal causes the law of 1898 to benefit not only all accidents in connection with the task assigned to the workman who has become a victim, but also accidents which happen in a shop or works, even though they have no direct connection with the work, from the moment a workman arrives and places himself at the disposition of the foreman until the moment he has left the works and recovered his liberty. It has even been decided that a place 1,500 metres away from the spot where the workman was working constituted "an extension of the works."

Consequent upon this very liberal interpretation of the law, all accidents connected with work receive indemnity. Subsequent legislation in 1902 and 1905 has, however, produced most unfortunate results due to two distinct causes, one due to defects in the law of 1898, aggravated by the effect of the law of 1905, and the other due to the manner in which the laws have been interpreted by the magistrates. The defects referred to have given rise to innumerable abuses, such as simulated injuries, unduly prolonged disablements, exaggerated medical fees and legal expenses.

The interpretations referred to have resulted in an indemnity tax for permanent incapacity of the injured where the actual functional incapacity does not cause any professional depreciation.

The consequences are seen in an increase in insurance rates in 7 years of at least 50 per cent., and in some industries 100 per cent. and more, and in the demoralisation of a daily increasing number of workmen by the contagion of bad example and the facility for fraud contained in the law, which act as incitements to malingering and to idleness.

The cost of resisting the abuses is so great that they are rarely contested.

Particular complaint is made of the provision by which, if incapacity lasts more than 10 days, indemnity becomes payable as from the first day of incapacity. Statistics are given for various mutual insurance companies, by which it appears that between 1899 and 1906 the number of temporary incapacities per million francs of wages insured has risen from 74.6 to 145.54, and their cost from 5.034 francs to 11.073 francs per case. The increase has been a progressive one from 8.03 per cent. in 1904 of workmen assured, to 9.61 per cent. in 1905 and 12.03 per cent. in 1906.

The duration has increased from 17 days in 1899 progressively, to 23 days in 1907, an increase in lost time of 35 per cent. in 7 years.

Since the law of 1905, the number of accidents of more than five days and less than 11 days incapacity has continually decreased, showing a tendency, each year more accentuated, to unduly prolong the period of incapacity in order to obtain half wages for the four first days, which the law of 1905 prescribes in cases where the incapacity exceeds 10 days.

There does not appear to be any means of preventing this abuse. Similarly there is a formidable increase in the cost of medical and pharmacal expenses, which have to be also indemnified. The workman has the right to choose his own doctor and chemist, with the result that a class of practitioners has arisen who lay themselves out to exploit workmen's accident cases, and they make an excellent thing out of it for themselves. They employ touts to frequent works and jobs and secure them cases. They prolong the cases for their own and the workmen's advantage, piling up the cost of medicaments, visits, massaging, electric fomentations, ray examinations and the like.

No resistance can be offered because it is generally impossible after the event to say whether the things charged were necessary or not, and as the injured person is usually induced to sign in advance a number of blanks of attendances in a register, there is opened up a wide field for charging attendances which have never been made. In most cases the medical expenses exceed the value of the indemnity paid to the injured person. For example, in a case of a simple contusion of the thumb the indemnity came to 85 francs, but the medical, etc., expenses amounted to 124 francs. Numerous other examples are given. The like remarks apply to the pharmacal expenses. In the case of a workman having a contusion to the stomach, his indemnity was 162 francs, and the chemist's bill was 183 francs. Medical men of repute are scandalised at the way in which these medical exploiters teach the workmen to rob their employer or his insurer, by showing them how to simulate injury, but they appear to be powerless to prevent these abuses.

There are other abuses such as those connected with judicial fees and experts employed judicially, and the too liberal interpretation of the law as to the diminished earning capacity in cases of partial permanent incapacity.

It is said that the same abuses exist in Germany, and to a like extent. When we consider that insurance rates for workmen's compensation in France are, to begin with, much higher than in this country, it will be apparent that our French confrères have ample ground of complaint. Unfortunately our turn is probably coming. Since in our last Workmen's Compensation Act some of the features common to French law were introduced into our law, and a great augmentation of insurance cost has followed its application, the end of this augmentation is probably not yet in sight.

Apprenticeship Question.

The question of apprenticeship is considered to be a serious one in the French building trade.

The Revolution destroyed the then existing guilds and associations, and left every man a law unto himself as respects the training of apprentices.

The result has been that what is every one's business is nobody's business, and as a result, apprenticeship has decayed in France.

In addition, the following causes are alleged to contribute to the scarcity of apprentices:—

1. The desire of parents to see their children earning at as early an age as possible.
2. The effect of certain legal enactments in regard to hours of adult workers, and the forbidding of young persons who work shorter hours being employed in the same places as workmen whose hours are longer.
3. Increased use of machinery and subdivision of labour.
4. Tendency of masters to use the apprentice for other things than those specified in the indenture.
5. Objections by workmen's societies to the making of apprentices.
6. No means of controlling refractory apprentices.

Although to some extent schools intended for the training of apprentices exist, they are quite inadequate to the purpose, and the cost of the training is excessive, amounting on an average to 500 francs per year per pupil.

It is said there are 500,000 young persons employed in industry, only a small percentage (perhaps 10 per cent.) of whom receive any school training for apprentices; but if the whole of them were so trained, the cost would be about 250,000,000 francs per annum. The remedies which are suggested by the President of the Masonry Contractors of Paris, M. Villemin, are as follows:—

He suggests that a better scale of pay in the earlier years might be given, that the law as to apprentices and their indentures might be perfected, and that employers might be restrained from abusing the position.

The most novel and important suggestion is that it is the duty of society not only to care for infants, see that a primary education is given to each child, and that each youth serves his country for a term in the army. These things are admitted; but he asserts that it is the duty of society to train every young person in some department of industry, commerce or whatnot, so that he shall be rendered capable of earning his own living and be a productive unit of the nation.

He therefore considers that State supervision should not cease when the child leaves the primary school, but should be continued until the child has served an apprenticeship.

He would begin by having in the primary schools half the time devoted to three classes of practical instruction, comprised as follows:—1, Manual training; 2, commercial training; 3, liberal arts training. The training in each to be on general lines calculated to ascertain the disposition and capabilities of the children. Such a training should inculcate in the child the habit and love of work by teaching him to use his hands, to look at things from the practical side, and dispose him towards the study of what is likely to be necessary to him in later life and take away the idea that to go to a manual occupation on leaving school involves degradation.

Secondary education on similar lines should be also provided from pupils selected, judiciously, according to the aptitudes shown in the primary schools.

Finally the apprenticeship proper in a workshop, commercial house or otherwise, should be obligatory.

He would raise the primary school age to 14, and prescribe secondary schooling until 16, with apprenticeship of 3 to 5 years to follow. He would place by law the obligation of organising a system of apprenticeship and of carrying it out on the shoulders of the employers and require every employer to bear his share of the cost, as a tax on industry, he bases this suggestion on the ground that a workman is, practically speaking, a machine for production, and as such should be provided and trained by the employer for the same reason that the latter purchases and maintains the machinery which takes the place of manual work.

He further maintains that employers are the proper people to prescribe and direct such training, and that apprenticeship can only be effective if carried on in, on or about the works.

For this purpose he would make use of the Chambers of Commerce and employers' associations formed into corporate bodies 'ad hoc.'

They would have powers conferred enabling them to—

1. Fix the number of workmen required in the respective branches of commerce and industry.
2. Fix the number of apprentices required each year to replace workers dropping out.
3. Fix the number to be provided by each industrial or commercial unit.
4. Fix the amount of the annual tax for the training of apprentices based upon the average cost of training.
5. Study the best types of apprentice indenture.
6. Submit these types and supervise their application.
7. Discuss and settle with localities the possibilities in the way of courses of theoretical teaching and the remuneration therefor.
8. Study and prepare all agreements relative to this question, with the State, the counties, districts and Chambers of Commerce.
9. Study, supervise, and if need be, create ateliers for apprenticeship.
10. Pass certificates for finished apprentices.
11. Indicate, after competitive examination, those apprentices who, having obtained their certificates, were worthy to receive a superior practical and theoretical instruction.
12. Receive the part of taxation allotted for their use, and to direct and supervise its expenditure.

Mr. Villemin considers the certificate of apprenticeship under such conditions as affording a guarantee for the good behaviour of the apprentice, and as overcoming the difficulty at present felt in carrying out the agreement where an apprentice is refractory. Such in broad outlines is the scheme propounded by M. Villemin, and it must be admitted that it looks practical and should be much less costly than any State system of apprentice schools.

I have referred to it because I believe the time is not distant when some general action will be required in England to secure a proper system of apprentice training, and I certainly think in the building trade that time has already arrived.

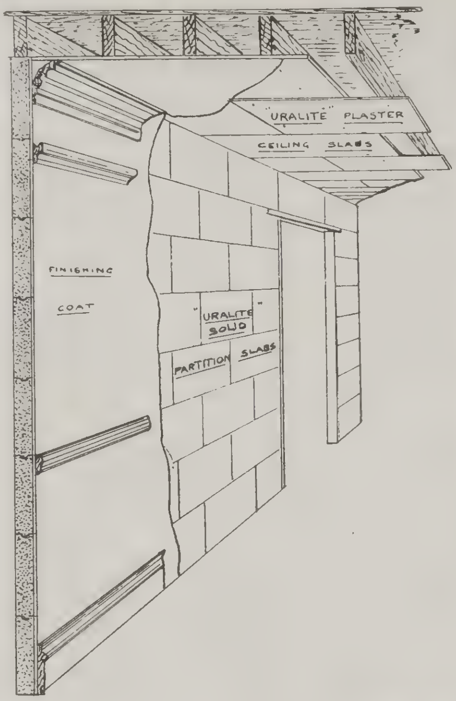
In conclusion, it appears from the documents which I have considered that our brethren of the building industry in France are taking themselves and their organisations very seriously, the work done is mostly voluntary, and a man is sometimes president of one part of the federation and secretary of another part; for example, the president of the Paris Masons' Association is, or was, secretary of the French National Federation.

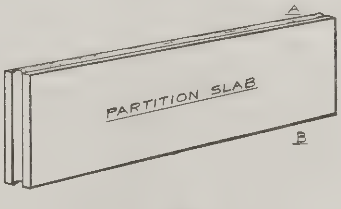
Their fees are remarkably low, about 1-6th of ours, and this no doubt is due to the voluntary work just mentioned. Probably as time goes on they will find as we have done that the work outgrows voluntary effort, and then the cost will have to increase. In the case of the Professional Association, for instance, a paid secretary must be a necessity.

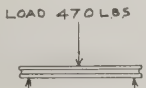
Trade and Craft.

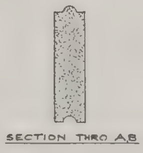
Uralite Co.'s New Partition and Ceiling Slab.

The fireproof nature of Uralite and Asbestone manufactured by the British Uralite Co., 16, St. Helens Place, E.C., is already well known to our readers, and it will interest them to learn that this company have now, after exhaustive tests and experiments, placed upon the market a new partition and ceiling slab, which, while possessing the fireproof qualities of uralite, is at the same time capable of erection without framing or supports These slabs are made from a high-quality plaster, combined with asbestos reinforced in all directions by very strong fibres, thus forming an ideal composition for slabs which are used for so many purposes and under such varying conditions. Some idea of the strength of the new product may be gathered from the following figures, these being the result of a series of tests carried out at the Engineers' Laboratory, King's College, London:—Tested as a beam 7½ span, the average breaking strain was found to be 293.6lbs. per square inch, while the crushing strain was 421lbs. per square inch.









Being partly composed of asbestos, the slabs are fireproof to the highest degree, whilst their semi-fibrous nature renders them sound-proof, thus making them invaluable for the division of rooms or cubicles where a thin partition is necessary to economise both in floor space and cost.

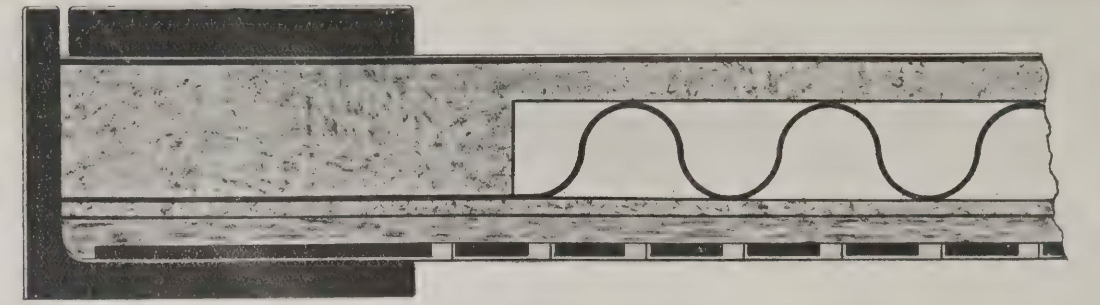
As will naturally be concluded, they are excellent non-conductors of heat and cold, thereby greatly reducing the cost of maintaining rooms, cold stores, etc., at an equable temperature.

These slabs are also proof against the attacks of rodents; and as they are constructed without the use of reeds, there are no cavities to harbour vermin of any sort.

Erection is most simple and rapid; and whilst the amount of wet plastering required as a finishing coat is reduced to a minimum, when completed an absolutely rigid partition is assured.

The "Checkfire" Doors.

We are informed that the "Checkfire" doors, as manufactured by the "Checkfire" Door Co., Tutaport Works, 2, Lonsdale Road, Kilburn, N.W., are now, after having successfully passed all the official tests, accepted by the Fire Offices Committee, and consequently by all the insurance companies. The following very succinct description of the "Checkfire" doors will, if read in connection with the accompanying illustration, which shows in section the exact dimensions of the various parts, fully explain the construction:—The door surface construction is fixed in an angle-iron frame 2ins. wide by 1½ins. deep by 3-16ths in. thick. One face consists of No. 19 S.W.G. sheet iron, adjoined by a 3-16ths in. sheet of asbestos composition, after which is a sheet of horizontally corrugated iron, No. 25, S.W.G. Following the corrugated iron is a 3-32nds. in. sheet of asbestos composition, followed in turn by a 5-32nds. in. sheet of asbestos slate adjoining the other face of the door, which consists of an iron plate of No. 14 S.W.G. perforated by holes 7-8ths. in. by 3-32nds. in. The whole is secured to the angle iron frame by means of an iron cover strip 2ins. wide and ¼in. thick, placed on the non-perforated face of the door and riveted through. Three iron strap hinges 1¾ins. wide by 5-16ths in. thick are riveted across the entire width, one in the centre, and the other two 9ins. from top and bottom respectively. The door is fitted with a lock. The door thickness at frame is 1½ins., and the thickness between the metal face sheets is 1in. For doors of dimensions not exceeding 6ft. by 2ft. 9ins., only two strap hinges are fitted. When made in two leaves, each leaf is fitted with a bolt at top and bottom, and one is fitted with a lock, and latches are provided for all doors. The rebates into which the doors are fixed are not less than 2¼ins. It is hardly necessary to add—what, indeed, is self-evident—that the "Checkfire" door is designed upon well-thought-out and thoroughly scientific principles. Theoretically, a door constructed in this way promises the utmost fire-resisting efficiency, and the promise has been completely fulfilled in practice, these doors having emerged triumphant from the severest tests. It will be observed that the door is of exceedingly light weight. It is a total thickness of only 1in. and half of this is accounted for by air-spaces. Moreover, the door is hung in plain brick rebates, and, the usual iron framework to the opening being thus dispensed with, a saving in cost and labour is effected, buckling through bulging of the frame is prevented, and the unpleasant creaking and grating noises caused by a door moving in an iron frame are avoided. The system of fixing adopted by the company is singularly easy and effective. All that is necessary is to cut rough reveals in the brickwork, and press the door home on to a bedding of cement, perfect adjustment being obtained without the least planing or trimming of either door or opening. The door is thus made to act as its own mould, and a perfectly smoke-proof joint is obtained. Among recent users of "Checkfire" doors are: H.M. Office of Works, for Ocean House and the Custom House; the



SECTION OF THE CHECKFIRE DOOR.

London County Council, for Bexley Asylum; the County Asylum, Wakefield; the Cinematograph Hall, Cardiff; and the Alhambra Theatre, Openshaw. For banks, hotels, and similar buildings, the doors may be rendered of decorative appearance; but their strong recommendation is their high efficiency.

Automatic Continuous Water Boiler.

Messrs. Richard Crittall and Co., 197, Wardour Street, W., point out that while it is possible to make a perfect cup of tea by boiling the water in a kettle or urn, it is probable that the tea will be unsatisfactory owing to water not quite boiling or over-boiled being used. Their automatic continuous water boiler, however, not only overcomes these difficulties, but has many other advantages. All working parts are outside the boiler, removed from the action of heat, and easily accessible for inspection. Every boiler is tested under working conditions before leaving the works. A large cleaning door is provided, through which every part of the interior may be cleaned, and the boiler refitted ready for use within two hours by an intelligent fitter or plumber, without the removal of the boiler. The boiler will supply boiling water at the rate of three pints per minute. Cold water is automatically admitted to the boiler in direct proportion to the amount drawn off. The gas supply is separately controlled, being instantly reduced when the water boils to consumption of 8ft. of gas per hour, and increased only sufficiently to heat the equivalent of the water used. The boiler is coated with non-conducting composition wired on. All parts are made to standard patterns, and replacements can be supplied by return of post. The boiler is provided with the following fittings:—Safety valve, gun-metal, enclosed type, with easing lever to meet Board of Trade requirements; dial pressure gauge and syphon to indicate exact pressure in boiler; water gauge fittings to indicate water level; interlocking device to prevent the gas valve being opened until water is turned on.

HOUSES AT PARKLANGLEY, BECKENHAM, KENT.

An independent and unusually dignified essay in town-planning has been made at Parklangley, Beckenham, where Messrs. H. and G. Taylor, the owners, have laid out an estate of about 700 acres. Mr. Reginald C. Fry, of Clifford's Inn, the architect, has grouped his artistically designed houses round a commonly accessible shopping centre. An avenue, 1¼ miles long, runs from east to west of the estate, very many tennis-courts have been formed, and the interests of motorists, cyclists, and golfers have been studied. A fully illustrated booklet, in which the houses are described and illustrated, shows a number of elevations that are so well diversified in design that they seem to have only one characteristic in common—their decided charm. We reproduce illustrations of two houses on pages 318 to 321 of this issue.

The portrait of the Lord Mayor-Elect of Bristol, appearing in our last issue was published by the courtesy of our contemporary "The Bristol Observer."

Federation News.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The Barnsley Federation held their monthly meeting on Wednesday, October 13th, Councillor G. Haigh, the president, occupied the chair, and was supported by thirteen members. The usual preliminary routine of business having been concluded, special attention was given to important correspondence. A letter was read from Mr. A. G. White, the National secretary, containing valuable suggestions towards the settlement of a difficulty between a Federation member, a non-federated master, and an apprentice transferring his services before the completion of his apprenticeship. The matter has been already reported in the "Builders' Journal," of September 22nd. Mr. White's suggestions were very favourably received and commented upon, as opening out excellent new suggestive ideas of solving a difficulty after the case had been practically given up as hopeless. The incident affords yet another direct proof of the valuable assistance the "Builders' Journal" renders through the medium of the secretaries' reports being carefully read by the right people.

The National Reserve Fund received attention, a special levy being made and promptly responded to by the various members generally.

A letter from the National secretary was read, containing suggestions and arrangements from the Journal Committee of the National Federation, re the furtherance of the influence of the "Builders' Journal." The suggestions were favourably received, and several copies of the Journal were distributed among the non-subscribing members by the secretary.

The secretary was instructed to attend the Secretaries' Conference held in Leeds.

The forthcoming municipal elections were next discussed, prominent members of the Federation being specially urged to allow themselves to be nominated as candidates. Each member, however, urged the ever-ready excuse "stress of business," and declined with thanks. The Barnsley Federation, nevertheless, is not entirely unrepresented, as included in its membership are two town councillors and two urban district councillors.

A meeting of the Executive Council of Tyne and Blyth District Federation was held at the Hotel Metropole, Newcastle-on-Tyne, on October 8th, Mr. W. T. Weir, president, in the chair, when representatives were present from the different local associations.

Tyne and Blyth District Building Trades Federation.

The minutes of the Executive Council meeting held on June 17th, 1909, were signed by the President as correct.

A report was given upon the annual meeting of the Tyne and Blyth District Conciliation Board, and correspondence was submitted which had passed between the employers and operatives with respect to the interpretation of rule 2 of the Conciliation Board rules, providing for trade matters being dealt with by trade committees. The action of the secretary in respect to the latter was confirmed.

The question of appointing various trade committees was considered, when it was pointed out that it would be advantageous to have standing committees for the district, and representing the different branches of the trade, to deal in the first instance with the disputes affecting particular trades. After discussion, it was agreed, on the proposition of Mr. J. T. Armstrong, seconded by Mr. Ferguson, to appoint trade committees, and that the following should be the employers' representatives, and that the operatives should be invited to elect a similar number upon the committees. Bricklayers: The President (Mr. W. T. Weir), Messrs. R. Heslop, Geo. Cocks, Brown, Leighton. Joiners: The President and Messrs. S. Easten, W. Foster, J. Simpson, J. T. Armstrong and J. Pelton. Stonemasons: The President, and Messrs. J. Lant, J. Simpson, Fairbridge and W. Gray. Plasterers: The President and Messrs. W. Ferguson, J. Niven, T. Anderson and P. Erskine.

The secretary reported that the agreement for working rules with the N.A.O.P. had been signed by all parties concerned. It was decided that a supply should be obtained and a copy forwarded to each member.

The question of the remuneration of the organising secretary was considered, along with his report, and it was resolved unanimously "That the Federation pay the organising secretary the sum of five pounds in payment of his services for the years 1908 and 1909."

The organisation of North Shields Association was further considered, and, on the proposition of Mr. W. Foster, seconded by Mr. J. T. Armstrong, Messrs. W. T. Weir, R. Heslop, W. Foster (Newcastle), J. R. Hadaway (North Shields), J. T. Armstrong (South Shields), and the Federation and organising secretary were appointed to interview the master builders of North Shields and Whitley.

The question of holding a Federation dinner was discussed, and it was decided to hold a dinner. The wish was expressed that the dinner should be held at Blyth, and this was agreed to.

The financial statement was considered, and on the proposition of Mr. J. T. Armstrong, seconded by Mr. W. Foster, accounts amounting to £18 18s. were passed for payment.—W. H. HOPE, solicitor, secretary, Post Office Chambers, 14, Norfolk Street, Sunderland.

Insurance.

Free £500 Accident Insurance Coupons have this week been sent to the following:—

C. H. E. (Aberdare), B. C. A. (St. Austell), C. J. D. (Bray), W. H. (St. Pancras), L. W. T. (Dinas Powis), C. W. R. (Hull), J. G. (Bridgend), C. E. H. (Croydon), H. T. S. (Ilkeston), J. A. M. (Grantham), R. V. H. (Halifax), J. H. P. (Whitchurch), F. E. C. (Rochester).

G. C. R. (Dover), S. R. S. (Nottingham), T. S. B. (Glasgow), L. H. (London, E.), A. J. K. (Glasgow), J. R. R. (Maldon), D. J. (Llanelly), F. W. A. (Sutton Coldfield), J. F. McI. (Gray's Inn), J. M. (Dalkeith), J. W. (Motherwell), D. J. B. (Cork), G. A. E. S. (Buxton), J. L. (Enfield Wash), F. D. (Hanley), J. F. (Fraser), A. H. G. (Bromsgrove), J. B. (Oldham), H. C. W. B. (Lowestoft), A. W. N. (Bristol), C. O. N. (London, E.C.), J. P. L. (Bristol), P. H. R. (Lancaster), J. A. I. (London, E.C.), S. L. (Carlisle), S. N. J. M. (Loughton), J. R. (Dunfermline), J. H. H. (Hull), E. J. A. (Gedling), H. C. (Lyme Regis), H. W. M. (Newcastle), B. M. (Biggleswade), H. J. W. (Peterborough), A G. W. (London, W.C.).

NOW READY !

THE NEW EDITION OF

SPECIFICATION

(No. 12, 1909-10.)

Price 3/6 Net.

BY POST, 4/-.

A well-known Architect writes :—

> "SPECIFICATION grows in usefulness year by year, and is at present an Encyclopædia of practical knowledge invaluable to the Architect."

(*Signed*) FREDERICK BATCHELOR, A.R.H.A., F.R.I.B.A., Pres. R.I.A.I

Special Points about the New Edition:

1. It has been very drastically revised and brought up-to-date in conformity with the opinions and suggestions of many well-known Architects and other professional men.

2. A general Index of Special Articles on Planning and Equipment which have appeared in previous issues is included.

3. The information has been rigidly condensed in order to reduce the bulk of the volume, and to make it easier for reference.

List of Sections.

The information in each section is contributed by a Specialist.

Division I.—Building Construction.

1. General Conditions.
2. Excavator.
3. Drainlayer.
4. Concretor.
5. Bricklayer.
6. Mason.
7. Terra Cotta & Faience Worker
8. Structural Engineer.
9. Fireproof Constructor.
10. Pavior.
11. Carpenter.
12. Joiner.
13. Ironmonger.
14. Roofer.
15. Ventilating Engineer.
16. Heating Engineer.
17. Founder.
18. Smith.
19. Plumber.
20. Bellhanger.
21. Mechanical Engineer.
22. Electrical Engineer.
23. Marble Mason and Mosaic Worker.
24. Plasterer.
25. Glazier.
26. Painter and Decorator.
27. Paper Hanger.
28. Horticultural and Landscape Architecture.
29. Blind Maker.
30. Furnisher.
31. Art Metal Worker.

Division II.—Municipal Engineering.

32. Roads.
33. Sewerage.
34. Water Supply.

Supplied by all Newsagents or direct from the Publishers.

THE ARCHITECTURAL REVIEW,

Edited by MERVYN E. MACARTNEY, B.A., F.S.A., F.R.I.B.A.

This high-class Review is finely illustrated, and includes among its regular features "The Practical Exemplar of Architecture," with Views and Measured Drawings.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, *Caxton House, Westminster.*

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Abersychan. — For erection of two houses at Mount Pleasant, Waterloo Road, Abersychan. Messrs. Pitten and Wilton, Architects, Club Chambers, Pontypool.

Powell Bros., Pontypool	£512	0	0

Why is one Man a Foreman another a Superintendent,

Another a General Manager—and the hundred others mere mechanics? He may have no better brain-equipment than the hundreds of workers under him, but he has the necessary technical equipment and thorough training in the science of his work.

It is this thorough training—in every item of technical and commercial work — which the International Correspondence Schools supplies so thoroughly and practically. An I.C.S. Course will give a practical workman a knowledge of his line which he could never get **at his work,** but which he gets twice as quickly because he is studying the reasons —the science—of his work while he is actually at it day by day.

We have thousands of letters from I.C.S. students who have promptly achieved commanding positions and high pay in different lines of work. Let us send you some of them. Let us show you what employers say about I.C.S. men as well Surely they will convince you.

If you have any ambition at all to rise higher you cannot afford to put off finding out about this practical, salary-raising work being done by the I.C.S. the country over.

The Moral of Middlesbrough.

The Middlesbrough Library Competition incident has now apparently reached its close. It will be remembered that a large number of the unsuccessful competitors protested strongly against the awards, on the alleged ground that in two of the premiated designs the conditions had been violated, to the advantage of the winning designs and to the disadvantage of those in which the conditions were supposed to have been more punctiliously observed. Eighty-three of the unsuccessful competitors (about 200 sets of designs were sent in) having the courage of their own opinion, sought and obtained the opinion of counsel. Two eminent barristers were consulted, and both agree that there is no ground of action against either the Council or the assessor—particularly not against the assessor, between whom and the competitors there was no contract. The immunity of the assessor in such cases seems to us to be perfectly just. If an assessor were liable to be dragged into court by all the unsuccessful competitors who felt (as in such cases we are all apt to feel) that they had a just cause of complaint against him, the position of an assessor would become utterly untenable. An excellent object has been served in showing that, according to eminent counsel, the assessor has, under ordinary conditions, no legal liability towards the competitors. The assessor's duty is "of a judicial or quasi-judicial character, and not one for breach of which an action would lie against the assessor." Less gratifying is the inference that the organisers of a competition are almost equally free from liability to the competitors. The organisers, it would seem, can effectually shelter themselves behind their assessor, who, as we have seen, cannot be called to account. In ordinary cases, therefore, where authorities take the common means of safe-guarding their own interests, the competitors who may feel that they have just cause of complaint are apparently destitute of all legal remedy or redress. As Mr. C. A. Russell has said, "the only effectual protection of the competitors is the competence and fairness of the assessor." Here we would repeat the perhaps unpalatable truism on which we have, in an earlier note on the Middlesbrough competititon, laid some stress—namely, that competitions are not held for the benefit of the architects, but in order that the organisers may get the design that is thought to be most suitable for their purpose; and they rely on the assessor to see that they get it. We imagine that the assessor, as a rule, will adjudicate in this spirit; and if the design that he thinks is on the whole the best happens to override in some particulars the conditions that have been laid down, he will not hesitate between the spirit and the letter. Hence it is difficult to agree entirely with the suggestion of the spokesmen of the Middlesbrough protesters as to "the necessity of the assessor drawing up the conditions himself when practicable, or, if he accept them, being bound to see that they are fully carried out." As to the advisability of the assessor himself drawing up the conditions, we are not for the moment concerned to discuss a proposition that is perhaps not so simple as on the surface it may appear to be; and with regard to the contention that the assessor is bound to see that the conditions are "fully carried out," while we admit that such a course would greatly simplify the work of adjudication, and would be extremely convenient for the competitors, we cannot help feeling that it would have a narrowing effect on both assessor and competitors, and would rather tend to destroy the *raison d'être* of competitions. When, therefore, Mr. Russell, K.C., observes that "Possibly it would be some protection to competitors if in all such cases it was made a definite instruction to the assessor that he was to treat as disqualified for a prize any design (however excellent in other respects) which did not fully comply with the conditions of the competition," he seems to us to encourage an illusory hope. The object of a competition is not to give prizes to architects, and it is simply inconceivable that a corporation will issue instructions to the assessor to disregard its own interests in the manner suggested. When any corporation becomes so loftily altruistic as to say to the assessor, "Never mind about getting the best design; give the prizes to the men who toe the line," the millennium will be appreciably closer. We still think that the road to reform lies in the direction not of greater stringency, but of larger freedom. Certainly competitors should not be harassed with doubts as to whether or not they may venture to override an awkward condition. They should have a free hand as regards well-nigh everything but accommodation and cost; and corporations would save themselves, the assessor, and the competitors a world of trouble and annoyance if they made their conditions few, essential, and explicit, and left everything else to the skill and intelligence of the competitors, and the discretion of the assessor. This appears to us to be the real moral of Middlesbrough, and we certainly think that the gentlemen who have had the public spirit to obtain counsel's opinion are to be congratulated on having placed competitions in a clearer light if not on a more satisfactory footing.

Arbitration Clauses

Three legal cases that are summarised in the present issue, are of more than ordinary interest to contractors. In one, the Court of Appeal decided that certain words alleged by the Corporation of Barrow to constitute an arbitration clause, had no such force. Consequently, a former order by Lord Justice Buckley, based on the supposition that the terms of contract made the defendant's engineer sole arbitrator in the event of disputes, has been upset in the Court of Appeal, the Court holding that the clause in question gave the engineer administrative powers only, and not judicial powers. That is a minor point in favour of those who contend, as we have contended, that an architect or an engineer, or any other person who may be regarded as the agent of one of the parties, ought not to possess the right to act as sole arbitrator in a dispute arising between those parties. Such an arbitrator is placed in a most invidious position, and it is gratifying to find that, in the course of the action, Lord Justice Vaughan Williams expressed the opinion that, if there was good reason, having regard to events that had occurred, to think that justice might not be done in an arbitration, the Court might, in the exercise of their discretion, override such a clause in a contract—an utterance that will do much to strengthen the position that contractors are taking with respect to this very important question of contractual referees.

Extras and Agency.

The second case raises the eternal question of extras, and the equally persistent problem of agency. In this case the contractor for the construction of a sewer found that actual physical conditions were different from those that had been anticipated, and that expensive deviations became necessary as the work proceeded. Some of these deviations were, it was contended, sanctioned by defendants' agents, and here an important point arises. "If," said the Official Referee, "the work was in fact so changed as to be a different one, there would be the difficulty of implying a contract to pay for it, as the engineer had no authority to make such a contract for the defendant Council." The engineer's powers, it would therefore seem, may be freely limited in favour of his employers, who may apparently disavow his agency almost whenever they think proper—when, for instance, he sanctions extras for which they do not wish to pay, or when they affect to regard him as a disinterested arbitrator between themselves and the contractors. This is certainly consistent; but as certainly it points to the necessity for some modification or re-adjustment of both the legal and the lay views of the relationship at present subsisting between the owner, the intermediary, and the contractor; for it is evident that under the present conditions the contractor incurs more than his fair share of the responsibility. The chief lesson to be drawn from the present case, however, seems to be that contractors should refuse to proceed with extensive extras until they get an authoritative order in writing.

Waiting for Wages.

In the third case to which attention is drawn, employers successfully resisted the claim of a dismissed workman to be paid for the time during which he was kept waiting for his wages. He was given an hour's notice at five o'clock in the morning, and he was not paid his wages until 10.45. He claimed 3s. 11d. for the time. The county court judge had allowed his claim, but, on the appeal, Mr. Justice Darling held that the plaintiff was under no obligation to wait about for his money, and was no more entitled to be paid for waiting than any ordinary creditor—a tailor, for instance, or a barrister who was kept waiting for his fees—or, his lordship might have added, a builder who is kept waiting an outrageous length of time for what is due to him on a long-finished contract. It is just and necessary that wages should be promptly paid; and employers have generally agreed to the demand that not one precious minute of the workman's leisure shall be unnecessarily consumed in waiting for wages. This, however, is a humane or an expedient concession to circumstances. The case under notice seems to illustrate a not very amiable characteristic of workmen, and a spirit that has a most discouraging and depressing effect on employers, who naturally feel hurt at the tendency to assume as a legal right the privileges that have been conceded as an act of grace, and to expect preferential treatment in both the making and the administration of the nation's laws.

Freak Architecture.

In a recent issue of a popular magazine, there is an illustrated description of what is assumed to be an extraordinary freak on the part of a Colonial architect. Some of the windows, high up in a public building, are supposed to be shaped like the broad arrow, the decorative device that adorns the convict's uniform, while over one of the openings is a moulding that is thought to bear a strong resemblance to "the hangman's rope," although it is perhaps only inferentially that specific brand of cordage. The explanation is that the building was erected by convict labour, and that the architect took advantage of his opportunity of symbolising that fact. The resemblance to a broad arrow and to a rope is (as shown by the illustration in the magazine) in each case sufficiently strong to give colour to the story; which, nevertheless, is probably one of the happy inventions of "that ingenious merry gentleman Mr. Benjamin Trovato," who has elaborated for our entertainment and edification many another gaily eponymous legend, such as that of the apprentice's column, whose transcendent beauty so incensed the master mason that, in a fit of jealous rage, he incontinently slew the clever but ill-fated youth; or that less tragic but equally unveracious narrative of the vane resembling what the dictionary calls "a wingless insect, parasitic in man," which was alleged to have been set up on the church steeple to typify the disgustingly mean treatment of the builder by parsimonious trustees; the vane being actually intended to represent, however, not the kind of "crawlin' ferlie" which Burns saw on a lady's bonnet in church, and which, with wretched taste, he immortalised in the paltriest of poems, but a majestic comet. For either object, the scale was purely arbitrary. Frankly, we have no belief whatever in the arrow and rope story. But it is good enough for the Marines—and the popular magazines.

Guildhall "Vernacular Gothic."

It is recorded, in the account of our representative's interview with Messrs. Lanchester and Rickards, that one of the *obiter dicta* thrown out by the gentleman first named was that he did not favour the term "town planning." He preferred the expression, "civic design." If (which is highly improbable) he has since happened to read in the newspapers an account of a recent instructive debate in the London Court of Common Council, he may see reason to revise his preference; "civic design," in the light of these proceedings, having assumed an aspect which he had possibly not foreseen. The Common Councillors were in uncommonly jocular mood, and some of their speeches were in the "vernacular Gothic" style. On a recommendation by the Lands Committee that three storeys should be added over the library corridor of the Guildhall, at an estimated cost of £3,800, Mr. Deputy Wallace moved the reference back. There ought, he thought, to be "a grand scheme of improvement which would enable the old Guildhall to stand for the next five thousand years." Mr. Banister Fletcher imported a little real architectural interest into the discussion by stating that the Guildhall is virtually a modern building, as the late Sir Horace Jones, when architect of the City, succeeded in producing, in the nineteenth century a fifteenth century building, and "Dance's front represented a page of the City's history of which they were not proud." Whereupon, "God bless my soul and body!" piously ejaculated a worthy deputy, "you have only to inspect the pillars that have been scraped in the Guildhall to see traces of the Great Fire," and he contended that the only new part of the great hall is the roof. Another gentleman said that the present front is "an architectural abortion;" yet another deprecated the perpetuation of "bastard Gothic." The upshot of the debate, however, was that the amendment was negatived. There was a hint at entire re-building. Would that it might speedily fructify! The City of London surely ought to possess a Guildhall constructed on the best principles of civic design, and pure and dignified beyond the cavilling of Common Councilmen.

It is announced in Rome that Professor Toramelle has discovered a prehistoric town in the centre of Barbagia (Sardinia), with streets, houses, and temples, and a surrounding wall of Cyclopean proportions. Professor Orsi and Professor Mackenzie of Edinburgh have arrived at Sassari to investigate the discovery.

MUNICIPAL TRADING.

The following letter has been published in the "Yorkshire Observer":—

LEEDS CORPORATION WORKS DEPARTMENT.

Sir,—The members of the Leeds Master Builders' Association, who belong to different political bodies and have every desire as a trade society to maintain strict political neutrality, take the liberty of trespassing on your courtesy to make one or two observations on the various statements which have recently appeared with respect to the Works Department of the Leeds Corporation.

The members desire to place on record their appreciation of the additional opportunities which have been afforded to private traders during the year of tendering for works which had been previously carried out by the Works Department, and note with satisfaction the increased volume of work which has been let to them. When comparison of labour is being made one should bear in mind not only the workmen at present directly engaged by the Corporation, but also have regard to the additional work carried out by contract. So far as the members of this association are concerned the volume of Corporation work has increased very appreciably during the past year, with its incident benefit to their employees and their dependents; while the ratepayers have also derived substantial financial benefits by this policy.

That this procedure is not detrimental to the workmen employed, either as regards wages or conditions of labour, is beyond question. One of the leading operative officials recently admitted that the Leeds Corporation were harder taskmasters than the private employers. Nothing further need be said on this point in the face of such testimony.

Many examples could be quoted as to the increased burden which has fallen on rates when municipalities have unduly trespassed on undertakings outside the recognised monopolies. The Bradford Corporation some years ago established a Team Labour Department, and notwithstanding the fact that it has prior claims for work on the other Corporation departments, it has been a charge on the rates since its inception, the loss last year being £1,556.

The association confidently assert that the policy recently pursued of giving private traders an opportunity of tendering for Corporation work is in the best interests of the workmen in particular, and of the ratepayers in general. It is gratifying to note that, while there are observations by both political parties on this subject, there appears to be no difference of opinion in regard to the wisdom and expediency of the Corporation entering into direct competition with private traders for works which are usually carried out by them.—I am, etc., J. Davidson, secretary to the Leeds Master Builders' Association.

Mr. Arthur Marshall, the well-known Nottingham architect, and one of the foremost amateur photographers in the country, is shortly to hold an exhibition of his prints in London.

* * *

With reference to the article which appeared in our issue of October 27th, in respect of the Parklangley Estate, it is pointed out that any impression that only one architect (viz., Mr. Reginald Fry) is designing houses for this estate would be erroneous. Mr. H. T. Bromley, A.R.I.B.A., Mr. Edgar Underwood, F.R.I.B.A., Messrs. Durrans and Groves, and others have designed houses which are in course of erection on this estate.

* * *

A Builders' Protection Society for Portsmouth has been formed, in consequence of a feeling that the trade are being unduly harassed in their work by unnecessary restrictions. We hope to find room in a future issue for further reference to this matter, which is obviously of more than local importance.

Architects of the Day.

VI. and VII.—Messrs. Lanchester and Rickards.

Probably no English firm of architects has had a more brilliant career than that of Messrs. Lanchester and Rickards. Most architects blossom into practice with small beginnings, designing a house for an admiring relative, or taking over a small work from a considerate and over-worked principal. But Messrs. Lanchester and Rickards commenced with big works and have adhered to them ever since. And if, as a well-known architect has told us, it is only the big buildings that pay or are worth doing, the firm are to be congratulated no less upon their wisdom than upon their success. Their success in competitive work is a notable proof of the value of the competition system (besmirched and discredited as it often is by gross abuses) in discovering latent talent and enabling the younger men to come to their own. Had competitions been an unknown feature of the modern art of building, it is probable that the firm would never have come into existence: Mr. Lanchester might now be pursuing the quiet tenour of an ordinary practice, and Mr. Rickards, if we are to share his own supposition, might have been a painter. It is neither fulsome nor exaggerated praise to say that English architecture would have been a heavy loser in such case, for we have here one of the few firms who can graft on to the stock of English Renaissance a certain freshness of treatment and a desirable breadth of conception that we are now tardily endeavouring to learn from France via America.

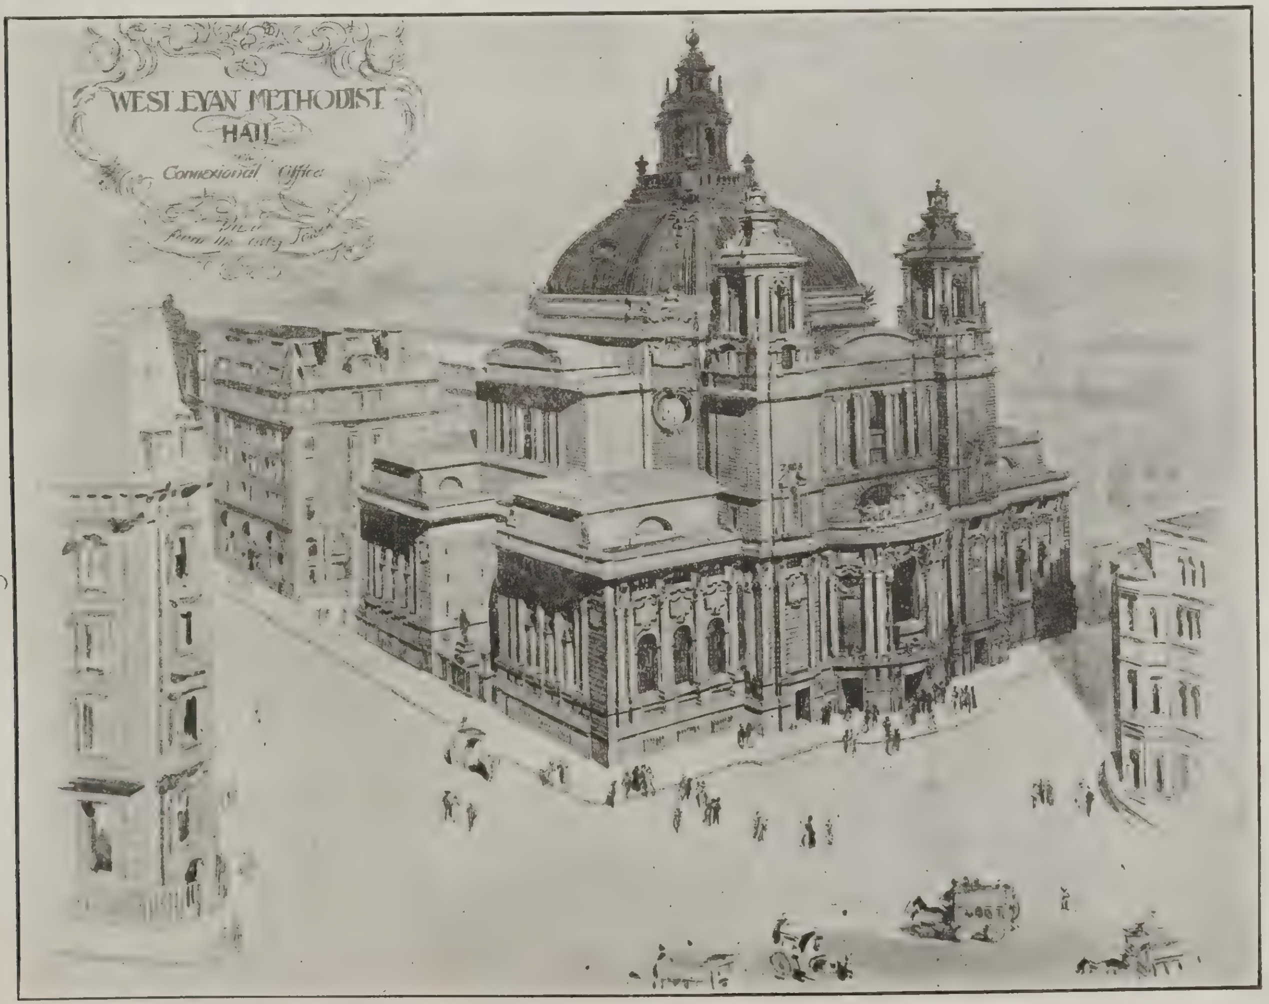
As is probably known to our readers, the firm was originally Lanchester, Stewart and Rickards, and it was under this style that the architectural world first learnt of the rise of a new firm, who, by winning the Cardiff Town Hall Competition, showed that it was to be reckoned with in the future big works of the United Kingdom. To-day, this seems, perhaps, ancient history. We are so accustomed now to look out for their design in any big competition that it is difficult to remember that the firm is comparatively young, and that its rise to eminence has been remarkably rapid. The untimely death, in 1904, of Mr. James Stewart, the second partner, broke an association that began in early days as assistants, and the firm has since been continued by the surviving partners with whom our notes deal to-day

Mr. Henry Vaughan Lanchester commenced articles with his father in 1879, and later entered the office of Messrs. Eedle and Myers, whose work was largely concerned with the design of hotels and licensed premises. Later he worked in the office of Mr. T. W. Cutler, F.R.I.B.A., and with Mr. George C. Sherrin, F.R.I.B.A. At the latter office he met Mr. Stewart, and thus began the friendship which was later to blossom into a partnership. Subsequently, and prior to the commencement of this partnership, he started in private practice, and carried out a number of works, among them a house at Sydenham for Mr. J. L. Johnston; the laboratory of the Institute of Chemistry, and the Bovril Company's warehouse and offices in Old Street, St. Luke's. Mr. Lanchester had a distinguished career as a student, winning the Aldwinckle Studentship and the Owen Jones studentship at the R.I.B.A., in 1889-90. He was elected A.R.I.B.A. in 1889, and F.R.I.B.A. in 1906, has been a member of the Council of the R.I.B.A. since 1899, and is a member of the Competitions Committee of the Institute, and one of the hon. secretaries of its Town Planning Committee.

Of recent years Mr. Lanchester has taken a keen interest in questions of town planning, which he prefers to call by the more comprehensive and correct term of Civic Design, and in pursuance of this study he visited America in 1907 to see many of the large schemes of civic planning that were either proposed or were in actual progress in the big American cities. The exigencies of his practice give Mr. Lanchester few opportunities to indulge his hobby for water-colour sketching—much to his regret; but he has always taken an active interest in the other arts, and has many artist friends.

It is a characteristic of the firm that they have always endeavoured to place the work of embellishing their buildings in the hands of artists. The fine sculpture at the Cardiff Town Hall and Law Courts from the chisels of Messrs. Paul Montford, Albert Hodge, Henry Poole, D. McGill, H. C. Fehr, and others, comprises some of the best and most vigorous modern English work. And unlike so many of our modern buildings, these buildings have been designed for sculptural adornment, and their sculpture has been designed for them. Such a happy result could only obtain where there was mutual appreciation and sympathy between the architects and their sculptors. A fine design by Mr. Charles Sims, A.R.A., for a painted ceiling to the staircase hall at Cardiff is another evidence of the firm's desire to employ a daughter art; but unfortunately this has never been carried out, and a bequest for decoration at the Town Hall has unhappily been devoted to other purposes.

Mr. Edwin Alfred Rickards, elected F.R.I.B.A. in 1906, summarised his early career in the words: "I never did any good till I met Lanchester," a tribute, more than once repeated, that bears testimony not only to his partner's good feeling, but also to his discernment. Not being certain that such a condensed account would satisfy our



BIRD'S-EYE VIEW OF THE WESLEYAN METHODIST HALL, NOW BEING ERECTED AT WESTMINSTER FROM THE DESIGNS OF LANCHESTER AND RICKARDS, FF.R.I.B.A.

NOTABLE BUILDINGS IN GLOUCESTER.*

By F. Dare Clapham, F.R.I.B.A.

Gloucester.

About four miles further on to the south-west is Gloucester, a city which has often figured in history; it was an important military station under the Romans, and surrendered to the Saxons towards the end of the sixth century. Owing to its position on a navigable river, it has always been of some importance.

In the time of William the Conqueror it was a favourite resort for his court, and several of the Norman Kings used to spend Christmas there. In 1087 the city was nearly destroyed during the contest between William II. and his brother Rupert. Later it was the scene of many conflicts between Henry III. and the Barons, owing to his having appointed a foreigner as Constable of the Castle. It suffered from fire three times in the twelfth century, and again in the middle of the thirteenth century. Parliaments were held there by Edward I., Richard II., and Henry IV. In 1483 Richard III. came to Gloucester after his coronation, and from here gave the order for the murder of his two nephews.

The city opposed the Royalist cause in the Parliamentary wars, and for this reason at the Restoration its walls were destroyed.

The walls of the city were 5ft. to 9ft. thick, surrounded by a deep moat; there were four gates, north, south, east, and west, about ¼ mile apart, and where the four roads met in the centre of the town there was a High Cross, which was demolished in 1750.

New Inn—Fifteenth Century.

One of the most interesting buildings in the city is the New Inn, built at the end of the fifteenth century by John Twining to accommodate the number of pilgrims who flocked to the tomb of Edward II. The New Inn was probably so called because it was built on the foundation of an older one; it was formerly one of the possessions of the Abbey of St. Peter, and after the dissolution of the monasteries it was granted to the Dean and Chapter, in whose possession it remained until recently, and formed part of their income. It is a picturesque, half-timber-framed building, built round two courtyards and covers a good deal of ground, being, without the stables, 170ft. long. The rooms all lead to open galleries running round the courtyards, approached by outside staircases to the different floors; the whole of the timber is chestnut, and parts of it are richly carved. There is a well-preserved angle-post at the corner of New Inn Lane, on which is some beautiful carving. There are two figures, both angels, holding scrolls bearing the words "Salve" to welcome the coming, and "Benedicti" to speed the parting guest. The canopies above the figures are particularly good.

Flemish Influence.

In Westgate Street there is a house with an old front with good windows bearing traces of Flemish influence; a chimneypiece inside bears the date 1633, and is celebrated as the house which Colonel Massey made his headquarters in 1643, when the city was besieged by Charles I. Many of the houses contain good panelling and elaborately carved chimneypieces.

In the house opposite the Corn Exchange, in Southgate Street, which has a carved and ornamented front, there is a handsomely carved chimneypiece, bearing the date 1650.

The house where Robert Raikes (the founder of the Sunday schools) used to live is an interesting half-timber building with three gables.

Gate Piers.

There are several good examples of gate piers in the city, those standing in front of the Foresters' Hall and another house in Westgate Street being most noticeable. There are numerous churches in Gloucester, but most of them are of a late date, having been erected on the site of earlier buildings.

Gloucester Cathedral.

At the end of the sixth century, on the site of the present cathedral, a monastery was first built which was destroyed by fire, as was also in 1058 the Benedictine one which superseded it. The foundation-stone of the present cathedral was laid in 1089, Abbot Serlo being in charge of the work. Twice at the beginning of the twelfth century the fabric suffered by fire, and it is probable that in one of these fires the original timber roof of the nave was destroyed. This flat wooden roof was some 20ft. higher than the present vaulting, which was finished about the middle of the thirteenth century. The columns of the nave show traces of fire, being much calcined. There were two more fires at the beginning of the fourteenth century, and the south aisle of the nave was then built to save the south side from falling. In the early part of the fifth century the reigning abbot destroyed the west front with its two towers, and is supposed to have added the south porch. In about the middle of the same century the central tower was demolished as far as the Norman piers, and the present beautiful tower was added, and the Lady Chapel was built towards the end of this same century. It was not, however, until the reign of Henry VIII. that the abbey was made a cathedral. The nave piers are just over 30ft. in height, being nearly twice the height of those at Norwich; they are about 21ft. in circumference and 12ft. 6in. apart. The present flooring of the nave is some 10in. higher than the original pavement. Mr. Waller, who carried out the repairs of the cathedral in 1856, says that the whole of the nave was painted. It was at one time proposed by Kent to flute the columns, but happily the architect found out that they consisted of a stone casing filled in with rubble. We were fortunate enough to be shown over the cathedral by the superintending architect, Mr. F. W. Waller, and the careful ½in. scale plans which he had prepared of the various stages of the tower were of great interest. The tower at the roof level is 40ft. square and 225ft. high; it is carried by four Norman piers, which are loaded to the extent of 12 to 13 tons per foot super., a load which would make a district surveyor's hair stand on end at the present day, for the total weight of the tower is about 4,700 tons. The pierced corner pinnacles, which weigh 25 tons each, are supported at the inner angles by slight squinch arches, and probably with the idea of reducing the weight of the topmost story, the walling of the panels is only 8in. thick. The cloisters were built during the latter half of the fourteenth century, and are probably unsurpassed in beauty by any in this country. The monks' lavatory, which occupies four bays of the northern side of the quadrangle, is 47ft. long, and is in a fine state of preservation, even the waste water tank being discovered about twenty years ago.

Perhaps the most interesting part of the cathedral is the choir, which at first sight appears to be entirely Perpendicular work, but in reality this is only a thin casing to the original Norman work behind; this casing was put on during the fourteenth century, and is very cleverly contrived. In order also to make room for the splendid east window, which is 72ft. high and 38ft. wide, and some 5ft. wider than the choir, the two end Norman piers of the apse were removed, as was also the eastern apsidal chapel, when the Lady Chapel was built; these alterations are made perfectly clear by an examination of the crypt, where the foundations of the original Norman work remain.

On the north side of the choir is the tomb of Edward II.

It would take an entire evening to describe all the beauties of this splendid cathedral, which is probably so well known to all of us, and, therefore, these brief remarks must suffice to-night to deal with what is probably one of the most interesting ecclesiastical buildings in this country.

This concludes the list of places visited on the fortieth excursion of the Architectural Association, an excursion rendered all the more enjoyable by being blessed with the only real summer weather we have had this year.

Discussion.

Mr. E. Guy Dawber proposed a vote of thanks to Mr. Clapham, and observed that he (Mr. Dawber) was one of the members of the party that visited Cheltenham when that locality was chosen for the excursion fifteen years ago. The paper, he said, was one of the most delightful essays that had been heard in that room; and he hoped they would make it a rule to have such a descriptive paper after every annual excursion. In past years it had been the custom to give a brief resume of the buildings to be visited; and this was particularly useful, as, owing to an anxiety to sketch the various examples of architecture, the other aspect was apt to be neglected. He thought that particulars might be worked up before the next excursion came round. He held Camden to be one of the most interesting towns in England, all the work there being of an exceptionally high character. During the seventeenth century two brothers—Michael and Baptist Hicks—had lived at Camden. They supplied the court with silks and satins, and also lent money to the courtiers. James I. being a somewhat impecunious monarch, it is believed that they also lent money to him; and Baptist became a knight, and afterwards a baronet. He built the almshouses, the Victoria House, the Market Hall; he re-roofed the chancel of the church, and carried out some other works at Camden. He also built himself a large house at Kensington, and that was how the Camden Hill of to-day derived its name. Unfortunately both houses had been burnt down. He thought that Mr. Clapham had struck the keynote when he said the architecture was remarkable for its simplicity and good proportion. When he had said that he had said everything. All the houses in the district bore a certain family resemblance, which showed how tradition had lasted. It was interesting to watch how the builders had taken up the Renaissance, introducing it into their doorways, their fireplaces, and their tombstones; but, once they had mastered the new class of work, they excelled to a surprising degree, and produced the most charming buildings with the same amount of character that had distinguished their earlier work. The work executed at the time of Queen Anne and the early Georges was both simple and picturesque. In conclusion, he thanked Mr. Clapham most heartily for his truly excellent and interesting paper.

Mr. H. D. Searles-Wood, in seconding the vote of thanks, said he would like to thank the gentleman who had made the lantern slides from his photographs. He had no idea that such excellent results could be obtained.

Mr. J. Johnson supported the vote of thanks, and observed that, although he was a member of the party that had previously visited Cheltenham, he was afraid his memory would not carry over the time that had intervened. The A.A. excursions were always intensely interesting, and he hoped to be able to accompany them again at some future time. They presented valuable opportunities for the making of sketches, and measured drawings.

Mr. Flint Clarkson also supported the vote of thanks, and said that he would like to add his word of praise to the congratulations that Mr. Clapham's paper justly merited. In regard to the stone slates, to which the lecturer had referred, he would be glad to know where they came from. Mr. Clapham had also mentioned a Benedictine Abbey at Winchcombe, for 300 monks. Surely that number was excessive, considering that St. Albans, a great abbey, had only 60. He believed that the only instance of the use of Camden stone in London was at Fulham, where it had been employed by Mr. J. D. Sedding.

NEW LAW COURTS, CARDIFF: HALL TO ASSIZE COURTS. LANCHESTER AND RICKARDS, FF.R.I.B.A., ARCHITECTS.

The piers and special features of this hall are executed in Bath stone, the plaster and carved stone decoration being by Mr. Paul Montford.

Mr. C. E. Bateman having contributed a few remarks to the discussion,

Mr. A. N. Prentice remarked that the type of architecture found at Camden was also largely to be found in Northamptonshire. This probably was accounted for by the seam of stone that ran from the Wash to the Severn. In the local quarries, a thin bed of surface rock had been found, and this was largely used for the paving of gardens and for similar purposes. It was curious to note the absence of damp courses in the great majority of Cotswold buildings. It would be interesting to know exactly when they were introduced.

Mr. Henry Tanner, in summing up the discussion, observed that the paper was essentially non-controversial. He knew that Mr. Clapham had been expending a good deal of energy upon the preparation of the paper, but he had to admit that the result was even more surprising than he had anticipated. He thought that the lecture must act as a persuasive to younger members to join the excursions. Mr. Clapham, he thought, would make an excellent recruiting officer. Mr. Dawber would be pleased to know that they had already decided to make a paper dealing with the annual excursion a standard feature. With much pleasure he put a hearty vote of thanks.

Mr. F. Dare Clapham, in reply, said that Mr. Clarkson had certainly floored him with respect to the monks at Winchcombe. His only authority for the statement was that he had seen it several times in print. The stone slates, he believed, were obtained locally. In conclusion, he would like to say that the one thing which all the excursionists had in common was the enjoyment of the delightful architecture in the rural districts of England.

Mr. Searles-Wood having offered to bear part of the expense which would be incurred in the reproduction of some of the fine drawings that adorned the wall, for publication in the A.A. journal, Mr. Tanner formally accepted the kind offer.

The new R.I.B.A. Kalendar, for 1909-10, has appeared, price half-a-crown, and is to be had from the Royal Institute of British Architects, 9, Conduit Street, Hanover Square, W.

* * *

The hospital extension at Norwich, of which the King laid the foundation stone on October 25th, has been designed by Mr. E. T. Boardman, who presented his Majesty with the silver trowel with which the ceremony was performed.

* * *

A meeting of the Gloucestershire Architectural Association was held in Gloucester on Thursday evening, October 28th, the president (Mr. H. W. Chatters) in the chair. Others present included Messrs. W. B. Wood, E. J. Cullis, T. Malvern, E. A. Pryer, J. G. Crisp, G. P. Milnes, D. R. Lyne, and T. Overbury (hon. secretary). A resolution in favour of the statutory registration of architects was proposed, which gave rise to an animated discussion. The resolution was carried unanimously.

* * *

As the result of deliberations by the executive of the British Science Guild a correspondence took place between them and the London County Council, in which the guild drew attention to the anomalous manner adopted in London for the numbering of streets. The guild made certain suggestions, and as a result of the correspondence the County Council have now laid down the following rules:—"St. Paul's Cathedral is recognised as a central point; and the numbering of houses begins at the end or entrance of the street nearest to that building, except where a street leads from a main thoroughfare. Taking, therefore, the sides of a street as left and right (assuming that the back is towards St. Paul's), the odd numbers will be assigned to the left-hand side, and the even numbers to the right-hand side."

CONTRACTORS & CORPORATIONS: IMPORTANT LEGAL DECISIONS.

The following interesting cases were reported to the members of the Yorkshire Federation at their recent meeting:—

William Kennedy, Ltd., v. Mayor and Corporation of Barrow-in-Furness.

The recent decision of the Court of Appeal in William Kennedy, Ltd., v. Mayor and Corporation of Barrow-in-Furness, turned on the question: What is an arbitration clause? A contract was entered into for the construction of a dam and intake, but defendants' engineer, alleging that defect existed, refused a certificate of completion, and employed others to do certain works which he considered necessary to remedy the alleged defects. Plaintiffs accordingly brought an action to recover £31,264, the balance alleged to be due under the contract. On the application of defendants, Lord Justice Buckley made an order staying the action under Section 4 of the Arbitration Act, 1889, on the ground that the contract provided that defendants' engineer should be sole arbitrator in the event of any disputes. In appealing against the order, plaintiffs contended that the matter was not one that should be referred to him, especially as he would, in a sense, be the principal witness.—The Court, in unanimously allowing the appeal, held that the contract contained no such arbitration provision as was contended. In the opinion of Lord Justice Vaughan Williams, the clause relied on was a provision giving the engineer only administrative and not judical powers, and the words did not amount to a submission to arbitration. That being so, there was no ground for invoking the provisions of Section 4 of the Arbitration Act. Lord Justice Fletcher Moulton added that the clause was a carefully drawn up agreement, in which there was not only an absence of any formal submission to arbitration, but an express intention of avoiding the use of an arbitration clause. The clause referred to matters which the engineer had to decide from day to day, as when work had been done improperly and should be done over again, whether the proper materials had been used, and matters of that kind. The engineer's office was an administrative one. In matters of administration his word was law, but his lordship did not think the clause was an arbitration one intended to put the engineer in the position of arbitrator and justifying them in depriving plaintiffs of their right of appealing to law. When the action came on, however, defendants would retain all the rights they might otherwise have under the clause.—The Court refused an application to stay the action to allow the Corporation to consider the question of an appeal to the House of Lords on the point now decided against them. During the hearing, the point was raised whether, had the clause been held to be an arbitration clause, there would be any power to override it.—Lord Justice Vaughan Williams expressed the opinion that if there was good reason, having regard to events which had occurred, to think that justice might not be done in an arbitration, the Court might, in the exercise of their discretion, override such a clause in a contract.

Jackson v. Romford Rural District Council.

The plaintiff was employed by the defendant to lay twelve-and-a-half miles of sewer across the Essex marshes at Degenham, and construct an outfall in connection therewith. The claim in the action was for £10,000, the value of this work. The contract price for the work was £17,600, and the plaintiff claimed on the construction of the contract and specification, and the drawings which were included in it, that he had contracted to build a sewer in a dry soil, and at a specified depth, and that it was not necessarily to be water-tight. It was subsequently found necessary to alter the original levels in many places, and the result of the sewer having to be laid at different depths was that instead of its being laid in a dry soil, it had to be laid in running silt or sand. There were also other deviations required in the quantities, and timbering had to be done in the excavation. Two hundred and eight manholes were also specified for, but it was not specified that they should be made in concrete, whereas 198 of them were, in fact, made in this material. The result of all this was that a fresh contract was entered into on August 15th, 1905, under which further difficulties arose, and the defendants sought to make the plaintiff liable for the cost of works necessary to put things in order, and delays occurred by reason of the defendants being unable to obtain easements for the construction of the sewer. After lengthy negotiations, the writ was issued, and the defandants admitted £2,000 odd to be due to the plaintiff over and above what had been paid, subject to the satisfactory completion of the work and their counter-claim, but disputed the remainder of the claim, amounting to £7,000.—Mr. Muir Mackenzie (Official Referee), in delivering judgment, stated that the plaintiff's first contention was that the work specified had, by the direction of the defendants' engineer, been so completely altered that he was ordered to carry out, and did carry out, a work which was different in itself from the work indicated in the specification and quantities on which he based his tender, and had to be carried out in circumstances different from those which he reasonably expected to arise. A sewer laid at the contract depth would have been, if not in dry ground, in much less wet ground than he actually encountered. He found, as a fact, that the depths from the surface at which the sewer was laid, were in places different from the depths specified, and that in itself necessitated a variation in the amount of excavation. There were also variations of route. Each party went on in ignorance of the soil, and knowing that these were contractors' risks. The plaintiff went on sending in his account, and charging for extra work occasioned by changing circumstances, and never protested that he considered he was doing a different job, and no opportunity was given to the defendant Council to consider an altered position. He also found that there was no evidence from which he could infer that there was such a change of work that a contract to pay its value, day work and materials, could be implied. Any case of representation was met by the case of "Thorn v. the Mayor, etc., of London," 1 App. Cas., 120, and therefore he decided that the plaintiff's claim on this basis failed, and that it was sustainable only for the contract price plus extras. If the work was, in fact, so changed as to be a different one, there would be the difficulty of implying a contract to pay for it, as the engineer had no authority to make such a contract for the defendant Council. The case of "Lawford v. Billericay Union," 1903, 1 K.B., 772; 67, J.P., 245, would not quite meet this case, as mere acceptance of extra work does not of itself involve a contract to pay for it, when the employer has specially guarded himself by limiting the authority of his agent, and stated in his contract the only conditions on which he will pay for work other than contract work. With regard to the defendants' contention that the work was not completed, and that it was not done to the satisfaction of their engineer, the work had been done as the defendants' representative on the spot had ordered it. He must therefore find that the plaintiff did complete the work in accordance with the specifications and sections as varied by the defendants' orders, and therefore the defence of non-completion failed. Then there was a technical difficulty with regard to the extra work, because by the contract the defendants were only liable for extras ordered in writing by the surveyor or clerk of the defendant Council. These orders in writing were a condition precedent, and there were numerous cases which showed that where there was such a condition pre-

ENTRANCE DOORWAY, BOVRIL WAREHOUSE AND OFFICES. H. V. LANCHESTER, F.R.I.B.A., ARCHITECT, WITH ASSISTANCE FROM E. A. RICKARDS, F.R.I.B.A.

This doorway, which has been much admired, is on the Old Street façade of the building, which is faced with deep red glazed brick and Portland stone dressings, and cast-iron panels between the windows on the second and third floors.

cedent, and it was not waived, no liability for extras to the specified work arose. Where the certificate was final and given, the employer could not dispute liability for sums certified to be due on the ground that the certificate included extra work for which no written order had been given. The defendants pleaded there was no final certificate, and therefore it became the referee's duty to decide on the question of extras. Of these certain must be allowed the plaintiff, and others disallowed; and amongst the latter the large claim for repairs, as the plaintiff should have got a definite arrangement with regard to them. He must grant judgment for the plaintiff for £3,400 damages, and as the plaintiff had succeeded on one issue, but failed on two, and "set-off" of costs was inconvenient, he would allow the plaintiff three-quarters of the costs.

Mr. Maurice E. Webb, elder son of Sir Aston Webb, C.B., R.A., F.R.I.B.A., was married at St. Mary's Abbots, Kensington, on Thursday last to Miss Dorothea Margaret Besant, elder daughter of Mr. Edgar Besant.

* * *

Mr. McKenna, in answer to a question in the House of Commons by Major Anstruther-Gray, stated that 573 men are now employed at Rosyth, and that in March next this number will probably be increased to about 2,000.

* * *

"Quantities and the Quantity Surveyor from an Architect's Point of View" is the title of a paper to be read by Mr. William Woodward, F.R.I.B.A., F.S.I., at a meeting of the Quantity Surveyors' Association, at Caxton Hall, Westminster, on Wednesday, November 10th, at 8 p.m.

* * *

At a special general meeting held on October 26th, at the Builders' Institute, Bedford Street, Strand, W.C., Mr. Leonard Horner, president, in the chair, an election for two eligible candidates to be placed on the pension list took place, with the result that Mrs. Cocks polled 915 votes and Mr. Robinson 733 votes, and both were elected. The addition of the two new pensioners brings the number of those receiving (in the cases of widows)) £24 per annum and (that of aged clerks) £30 per annum respectively to 31, a large total, for whom the hardworking president and committee have to get donors and subscribers to provide funds. At the close of the election the committee voted £2 each to the unsuccessful candidates as temporary relief on account of the expenses incurred by them in canvassing for votes. A very hearty vote of thanks to Mr. Leonard Horner was proposed and carried. The secretary is Mr. John Austin, and the offices are at 21, New Bridge Street, Blackfriars, E.C.

Coming Events.

Friday, November 5th.

Society of Engineers, Caxton Hall, Westminster.—Dr. David Somerville, on "The Chemistry and Bacteriology of Sewage Purification," 7.30 p.m.

Tuesday, November 9th.

British Museum.—Mr. Banister Fletcher, F.R.I.B.A., on "Greek Architecture," 4.30 p.m.

Institute of Sanitary Engineers.—Mr. A. J. Martin, M.Inst.C.E., on "Scavenging and Disposal of Refuse" (Students' Lecture), 7 p.m.

Wednesday, November 10th.

Quantity Surveyors' Association, at Caxton Hall, Caxton Street, Victoria Street, Westminster, S.W. Mr. William Woodward, F.R.I.B.A., F.S.I., on "Quantities and the Quantity Surveyor from an Architect's Point of View," 8 p.m.

Manchester Society of Architects.—Mr. R. Weir Schultz, on "Practical and Theoretical Training."

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Nov. 24.	GARDEN CITY PLAN, BURY, LANCS. In connection with the forthcoming exhibition of cottage designs in the Bury Art Gallery, the Bury Housing and Town-planning Association offer three prizes for a design for laying out a garden city suburb within the confines of the Borough of Bury. First prize £5; second prize £3; third prize £1 10s. Designs should be sent to Mr. H. Townend, Curator, Art Gallery. Bury, Lancashire.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: one guinea.
Nov. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea. Deposit returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Dec. 1.	PUBLIC PARK PLAN, BANGOR (COUNTY DOWN.) The U D. Council offer a premium of £30 for the best scheme for laying out a public park, twenty acres in extent. Premium to include all expenses of successful competitor whose designs become the property of the Council. Schemes to J. Middleton, Town Clerk, Town Hall, Bangor, County Down.
Dec. 18	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly. Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A, F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Jan. 31 1910.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle. Director of the Museums. City Hall, Cardiff.

Warrington Elementary School Competition

Members of the Royal Institute of British Architects are requested not to take part in the above competition.—By order of the Council, Ian MacAlister, secretary.

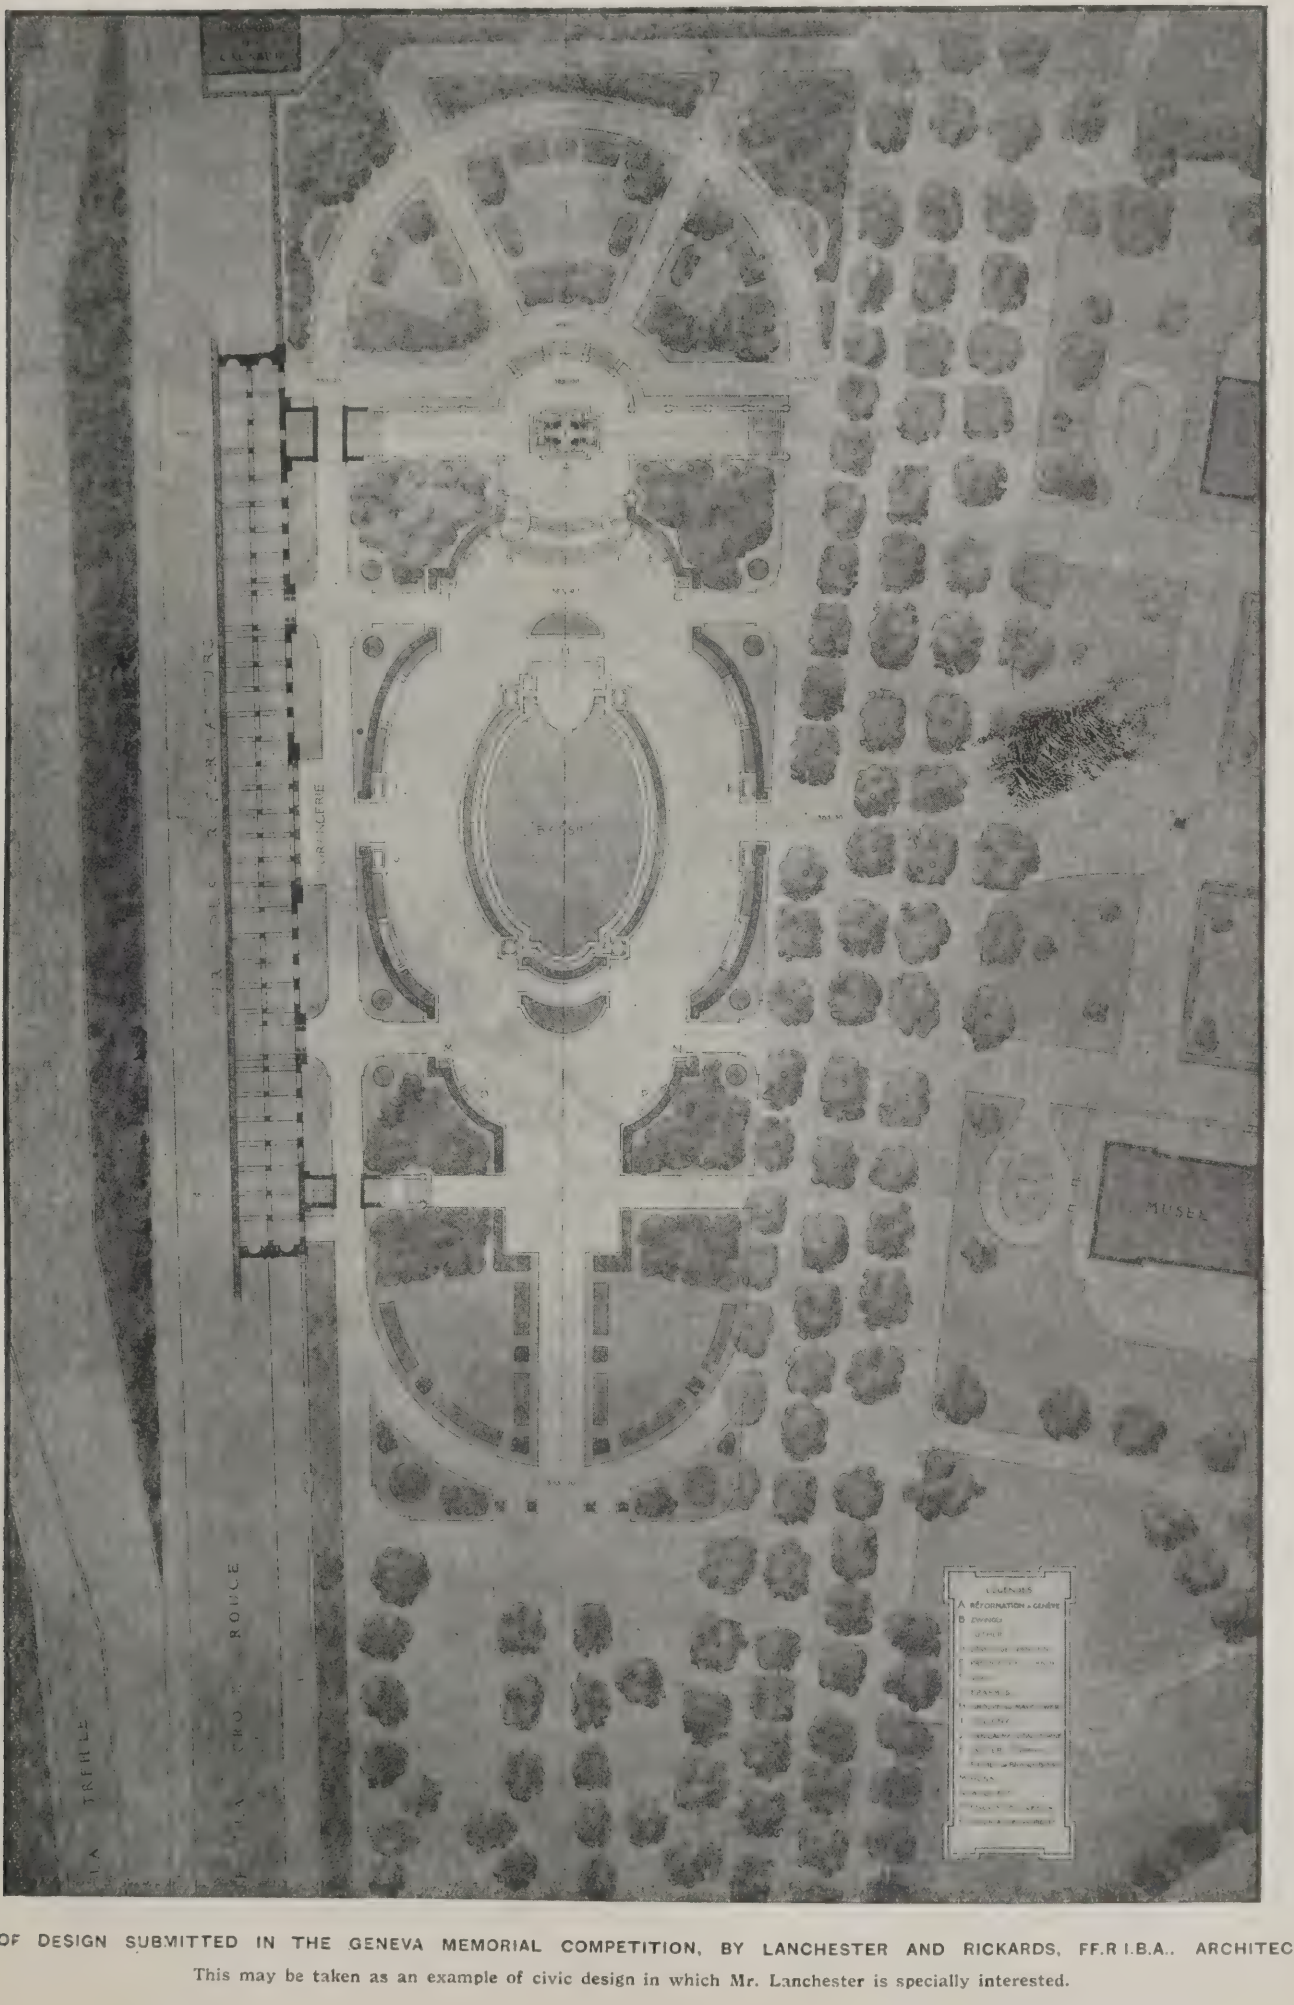
Middlesbrough Library.

Messrs. Hoskins and Brown, Kitching and Lee, and W. H. Bourne, have favoured us with copies of counsel's opinion, which, acting on behalf of eighty-three of the competitors, they have obtained with regard to this competition. The counsel consulted were Mr. C. A. Russell, K.C., and Mr. C. E. Brackenbury. Mr. Russell says: "In order to establish a cause of action, the unsuccessful competitors must show that there is an undertaking by the committee either (1) that only such designs as complied with the 'Instructions' should be submitted to the assessor; or (2) that the assessor in making his award would disregard all designs which did not comply with the Instructions; or (3) that the assessor would correctly decide the question whether a design did or did not comply with the Instructions, I am of opinion that no such undertaking can be derived from the advertisement or Instructions." He is therefore of opinion that the unsuccessful competitors have no right of action against the Council or committee. With regard to the assessor, Mr. Russell is of opinion that as there was no contract between him and the competitors, there is no cause of action against him. Mr. Russell believes that there might be a remote possibility of having the award set aside if the case could be brought under the Arbitration Act, although he thinks this course would be difficult, and that in all such cases "the only effectual protection of the competitors is the competence and fairness of the assessor." Mr. C. E. Brackenbury is also of opinion that the unsuccessful competing architects have no cause of action. He lays stress on the proviso that "the judgment of the assessor was to be final," and on the expressed opinion of the assessor that in his judgment the authors of the successful plans had complied with the spirit as well as the letter of the conditions. Counsel, examining in some detail the grounds of complaint, seems disposed to agree with the assessor's view, and does not find "any sufficient evidence to support the unsuccessful competitors' view that 'the award was given to a design which did not comply with the conditions as laid down by the Council,' or that there was any 'wholesale violation' or 'direct contradiction' of the conditions." He thinks it unfortunate that any question of verbal construction or legal interpretation of instructions should have arisen, but that this was perhaps unavoidable.

International Architectural Competition.

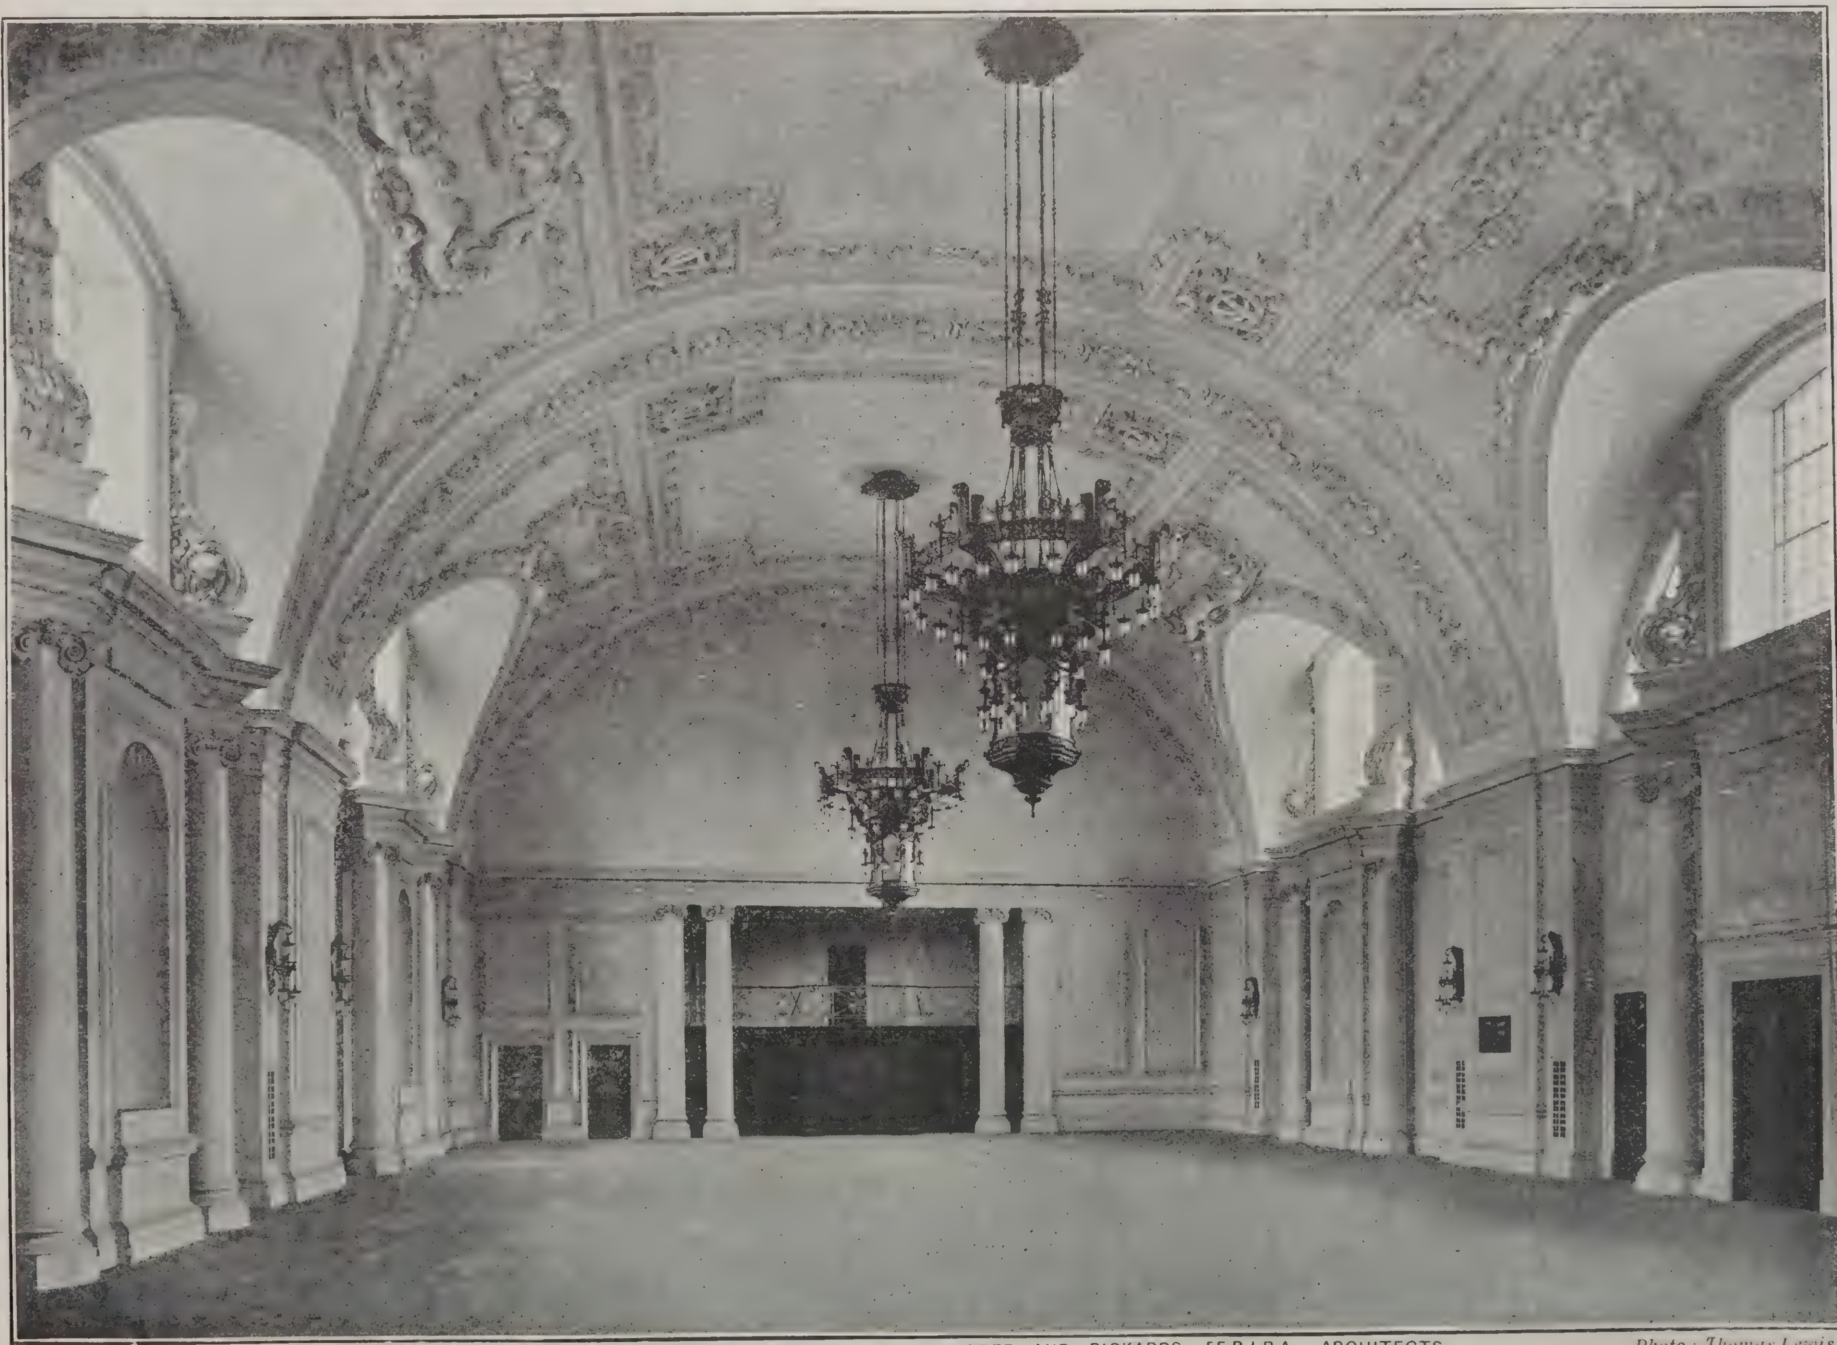
Together with the general regulations for the 1911 International Art Exhibition at Rome, the special regulations for the International Architecture Competition have been published in the principal European languages. This competition is open only to foreign States, to whom the choice of the architects and of the models of buildings is exclusively reserved. Its purpose, as well as that of the National Competition, reserved to Italian architects and builders, is to mark the progress that has been made during the past thirty years in the design and decoration of dwellings. Three prizes, of 150,000, 100,000, and 50,000 lire each, are to be awarded. An International commission of judges, named, partly by the competing States and partly by the presidency of the committee, will award the prizes. Foreign States who intend taking part to the competition will have to forward a formal declaration to the Presidency of the Committee before December 15th, 1909. The allotment of the areas will take place on December 31st. All communications concerning the International Architecture Competition should be addressed to Presidenza del Comitato per le Feste Commemorative del 1911, Sezione Belle-Arti, Piazza Venezia 11, at Rome.

In the House of Commons on October 25th, when the House resumed the consideration of the Land Bill in Committee, an amendment to Clause 35 (exemption of land held by local authorities), was moved by Mr. Austen Chamberlain, who explained that it had been designed for the protection of garden cities. It provided for the exemption of "any body corporate recognised by the Treasury as working for public utility, and not dividing any profit to its members other than a limited rate of interest approved by the Treasury in each case." The amendment was negatived without a division.



PLAN OF DESIGN SUBMITTED IN THE GENEVA MEMORIAL COMPETITION, BY LANCHESTER AND RICKARDS, FF.R.I.B.A., ARCHITECTS.

This may be taken as an example of civic design in which Mr. Lanchester is specially interested.



CITY HALL CARDIFF: THE ASSEMBLY HALL. LANCHESTER AND RICKARDS, FF.R.I.B.A., ARCHITECTS. *Photo: Thomas Lewis.*

The plaster work on the ceiling of this hall was executed by Mr. G, P, Bankart, The electric light fittings are of bronzed wrought-iron; they are exceptionally elaborate and weigh as much as a ton each; they are suspended by special gearing and can be lowered when required.

HULL SCHOOL OF ART. LANCHESTER AND RICKARDS, FF,R.I.B.A., ARCHITECTS.

The elevations are in red brick with Portland stone dressings. The sculpture is by Mr. H. C. Fehr, and the mosaic panel was executed from cartoons by Mr. Alfred Garth Jones.

R.I.B.A.

The seventy-fifth session—1909-1910— was opened on Monday evening, when Mr. Ernest George delivered his Presidential address as follows:—

We meet to-night at the opening of the seventy-fifth session of our Royal Institute, and it has been the custom on such first nights for the President to make his oration, and you listened with courteous patience a year ago to my expression of sentiments and views about architecture and the concerns of our calling. My words to-night shall be few, for, happily, we have a more distinct interest in gathering here, perhaps overcrowding our room. Our numbers and our needs have outgrown the accommodation. It is a satisfaction to be able to state that after a few months we shall be suitably housed, spreading into the adjoining galleries that we have long coveted and in which will be our lecture theatre. This library will no longer be deranged for sessional meetings. The pictures, our precious possessions, which are now skied and which are deteriorating in the upper region of exhausted air, will be hung in a becoming light, doing justice to their distinguished painters and to our past presidents. Our collection will shortly be made richer by the fine portrait of our late president from the hands of Mr. Cope. We shall be able to receive our guests with comfort and propriety without the present struggle for tea and toast. Also we shall have room for the exhibition, under our own roof, of the studentship drawings and of other collections that may be desirable from time to time.

In our art we do not make history so rapidly that there is a new story to be told each year. Progress, I believe, is steadily making—the result of sound training in our schools and of a truer appreciation among ourselves of the principles of building and design. There is a growing desire for breadth and largeness of treatment rather than for pretty detail and the trivialities that once interested architects and their public.

We must report l'Art Nouveau as already in a moribund state, and happily we have not been startled by a later invention. We are seldom asked now why architects do not originate a style. Those who have followed the history of the art know that each style, seeming distinct, has been the result of growth, changes coming by degrees, sometimes by assimilation of foreign forms, as well as in variations of detail at the hands of the cunning craftsman, who yet held to the traditions in which he moved.

Such changes have at times been accelerated, as when the influence of the revived Greek and Roman art spread through northern Europe, and men of genius made new melodies on the old chords. Yet the giants of those days did not claim to have invented styles. To meet constantly changing requirements and to accept new methods of building, evolving new modes of treatment, will give vitality to modern work which must not resuscitate old models. I give my humble opinion that the average work of architects now is better than it was even several years back, one advantage being that there is less diversity and a more general acceptance of a common style. There is the desire to fall into line rather than for strong self-assertion. Forty years ago, if we had a street frontage to deal with, a first thought was "Shall it be Gothic or Classic?" Now the feeling is that it should harmonise with its surroundings; better than the latter if possible, but not with a clash or discord.

For the carrying out of our work we have in this country admirable builders, and I am glad to state my experience in this matter. We have also the British workman, who is often spoken of slightingly, and perhaps with justice when known only through the demagogues who are too often his mouthpiece. We have craftsmen and workmen equal to the best. For these to have any independence and strength it was found necessary to combine and form Unions, and these have been helpful in preserving the men's rights. We have, however, to lament the short-sighted policy of these Unions in suppressing the individuality and self-reliance of the man. The intelligent mechanic, with skill and energy, must receive no higher wage than the wastrel; he must not work an hour longer, nor must he do more work in the hour. He is robbed of all ambition and of the possibility of improving his status. Our politicians on both sides of the House avoid this home truth, and discuss other ways of making our workers compete with skilled and industrious toilers in other countries. They do not say that the law the man makes for himself stultifies him and excludes him from the labour market. These artificial conditions of labour have also made the housing of the working man almost impossibly costly.

The future of our art is in the hands of the young men now in our offices, or in the good schools where a training is given much more thorough than could be had a generation ago. We are able to take stock of these future architects annually at the gathering of students' drawings in competition for our medals and prizes. The work shown last winter perhaps exceeded in quantity the product of previous years.

An effort is being made to give direction to the studies of those who go out with our awards, so that time may be spent to the best advantage among the great examples; precious time has sometimes been wasted in miscellaneous and objectless sketching for want of a defined purpose in travel.

One of the aims that we have before us is the founding of a British Architectural School of Rome, the presentation to which would be our highest academic prize, and I am glad to say that this scheme has ceased to be in the clouds. Time and thought have been given to the subject, and much information gathered. A special committee has struggled with the problem, and our able friend Mr. John Simpson has drawn up a practical working basis for our consideration.

It has further been proposed by Sir Brumwell Thomas that we should have a "Diploma School"—a school where architectural study would be carried further than in the ordinary course of training or apprenticeship, and on men from this higher grade our "Prix de Rome" would be conferred; this would be equivalent to a prize Fellowship, giving leisure for higher culture.

It has but lately been realised how important is the study of civic design and town planning. It does not fall to our lot in the old country to scheme new cities on noble lines. We have, nevertheless, most of us seen familiar places change their aspect by degrees, often with lamentable result. There is now a general desire that new quarters of the town and new streets shall not come haphazard and by accident, but shall be the result of forethought, and part of a comprehensive plan with consideration of possible future needs. Architectural effect is to be studied as well as convenience and economy.

These matters have been till now left to surveyors and engineers. The study of such important problems will in future be brought before our architectural students, and, by the generosity of Mr. Lever, the Liverpool University is the first to enjoy a professional chair for this special study.

A group of able men among our Institute members form a Committee for the study and elucidation of this subject, and we have had the advantage of addresses here and of essays in our Journal and elsewhere, giving the results of their research. This Committee is also considering the proposal to organise a Conference of those interested in the work of Town Planning.

We are glad to realise that something has been done to reform suburban life from its monotonous environment. "Port Sunlight" perhaps was the earliest effort to supersede the usual rows of machine-made workmen's dwellings by groups of cottages with character and individuality, these having their outlook on a garden or green instead of always on the street.

The Garden Suburb at Golder's Green, Hampstead, is another happy growth on somewhat similar lines. It has been laid out with skill and judgment, the several roads or vistas taking advantage of any points of interest in the view. Ugly "backs" are avoided, the cottages being made seemly all round. There are dwellings for workmen, also accommodation suited to clerks, while there are larger houses for those of larger means. The desire has been to avoid an unrelieved and dreary aggregation of one class.

Another oasis, in a district with no natural attraction, is formed by a gathering of suburban villas, built by Mr. Willett, to the north of Regent's Park. These are by various architects, and they are happily grouped in relation one to another; instead of fences their forecourts or front gardens are enclosed by neatly clipped yew hedges, outside which is a well-shorn grass margin to the road, and this is not harmed by traffic or the passer-by. Looking from these houses or at them the aspect is pleasant with an air of the country and of Kate Greenaway; we wish every success to such speculative building.

We have seen changes come, mostly for the better, in our own great city, while probably greater alterations must follow. Let us prepare for these.

Between the City and Southwark is to a new "St. Paul's Bridge." This is a matter of vital interest, and we trust that with collective wisdom and good judgment we may have a fine architectural feature, with well studied approaches. Is there any reason why a Thames bridge built now should have less dignity and propriety than London Bridge and Waterloo Bridge? Is there not a shoddy and commercial appearance about most of the later attempts to span the river—a lack of monumental fitness? The bridges of a great city are the features that most impress the mind and remain on the memory.

While speaking of the City I would refer to the Guildhall, with its record reaching back to the days of Henry IV. The interesting crypt and the masonry of the walls remain, but generations of pottering have left little else. Even the late front by Dance has been mutilated. To meet modern wants great changes and rearrangements are to be made shortly, and we trust the best advice and the best possible scheme will be secured for this work. There is also a minor project for building kitchens, etc., now, to the disfigurement of the building, without reference to the future scheme. We would beg the Corporation to defer this work until they have decided on a comprehensive plan. Such halls are of national—I might say international—interest considering their wide hospitality. Some of my friends here will remember how the Burgomaster of Vienna last year, at the Architectural Congress, feasted a thousand of us in the Great Hall of the Rathaus.

In England we get fewer opportunities for architecture on a grand scale than is afforded in other countries. With our Continental neighbours a provincial railway station is made an occasion for an architectural feature; with us we demand only a restricted amount of accommodation and of convenience. The work of a post office is carried on perhaps in half of a grocer's shop, while in a French town the Bureau de Postes would house its officials in a structure with some magnificence.

Just now interest is taken in a scheme for a Playhouse as a fitting memorial to our great dramatist. I hope this may be realised on a dignified scale.

It is strange that while music and musicians have encouraging support here we cannot have an Opera House adequate to our important city. It is not in us to emulate Paris with its Place de l'Opera, where architects, sculptors, and painters have enjoyed a free hand. Here the State is not expected to help in embellishments of the capital. Great demands are made upon her just now, but the desire is rather that she should take a grandmotherly interest in our private and domestic affairs.

(Continued on page xxi.)

DEPTFORD TOWN HALL. GENERAL VIEW OF THE FACADE. LANCHESTER AND RICKARDS, FF.R.I.B.A., ARCHITECTS.

The façade is built of Portland stone, and the sculpture is appropriately connected with shipping with which Deptford is connected. The four figures by Mr. Henry Poole are those of Admirals Drake, Blake, Nelson and a contemporary officer. They have accessories in the shape of ships of corresponding periods The central bay sculpture is by Mr. Albert Hodge.

Proposed New Works.

ABERDEEN.—Plans to an estimated value of £8,500 have been passed. These include eleven new cottages in Clifton Road, four dwelling-houses in Richmondhill Road, a timber store in Ashvale Place, and alterations and additions to Seabank House.

ACTON.—Acton Council has given instructions to its clerk to negotiate for the purchase of a number of acres of land at North Acton upon which to erect workmen's dwellings on the garden suburb style. It is proposed to erect for the present 200 houses either in pairs or in threes, 15 to every acre of land. The houses will have five rooms and bath room, and let at from 6s. 6d. to 8s. 6d. per week inclusive. Councillor J. Shillaker, the promoter of the scheme, said that houses could be erected for £400 the pair, including architect's fees. These would have gardens from 60ft. to 100ft. in length.

DERBY.—The application of the County Council for sanction to borrow £8,000 for the purposes of purchasing certain property opposite the existing offices to be utilised in the extension of the present limited accommodation, has been the subject of a L.G. Board enquiry. The cost of the buildings is estimated at £12,000.

EDINBURGH.—The proposed re-building of the Royal (Dick) Veterinary College on a new site at the east end of the Meadows has been considerably assisted by the formal decision of the Scottish Education Department to recognise the College as a central institution under the Education Act of 1908, and to provide up to £25,000 a sum equal to the amount raised locally, towards the cost of the new building. The College, which is the oldest of its kind in Scotland, is more largely endowed in respect to its Chairs than any veterinary institution in the kingdom. The site is estimated to cost £8,750, and the new buildings £41,250.

ESHER.—The King has forwarded a donation of £50 towards a fund being raised for repairs to the roof of the old parish church of St. George's, Esher. The cost of carrying out the necessary repairs to the church for its preservation will be about £300.

FALKIRK.—The Dean of Guild Court have granted warrants for the erection of a large new skating rink, to be built in Hope Street at a cost of between £3,000 and £4,000, a public-house in High Street, and villa residences and cottages in various parts of the town.

FIFE.—Owing to the great development of the Fife coalfields, the erection of larger offices for the Fife and Kinross Miners' Association has become imperative. The plans, which were before Dunfermline Dean of Guild Court recently show a two-storey building. The ground floor is to be occupied as officials' offices, cloakrooms, etc., while on the upper floor are to be situated a boardroom capable of accommodating over 100 delegates, and waiting-room.

LANGLEY MILL.—A permanent church in place of the present corrugated iron building, is shortly to be erected. A site, valued at a thousand pounds sterling, had been given by the Butterley Company—the site facing the Erewash Hotel. Plans for the proposed new stone church have been submitted (and accepted) by Mr. Sydney Brocklesby, of Wimbledon. The estimated cost of the new church is between £4,000 and £5,000.

RENFREW.—During the five weeks ending October 11, plans for the erection of the following buildings had been lodged:—Villa in Woodend Road, Newlands; double villa in Church Road, Giffnock; terrace of 16 cottages in proposed new street on Braidbar Estate, Giffnock; terrace of eight cottages in Mossgeil Road, Newlands; four double villas in proposed new street at Giffnock; additions to the Johnstone and District Cottage Hospital, Elderslie, for the hospital trustees; double cottage at corner of Beith Road and Newton Avenue, Elderslie; four tenements in proposed new streets on Braidbar Estate, Giffnock; double villa in proposed new street on Eastwood Mains Estate; double villa in Southbrae Drive, Jordanhill; two-storey tenement at Brig o' Lea, Neilston; addition to house at Staneley Reservoir, Paisley; and villa in proposed new street off Busby Road, Clarkson. The valuation of the linings has been estimated at £35,860, as compared with £16,050 for the corresponding period of last year.

SCULCOATES.—Plans have been passed for additions to a house at North Ferriby, for the Trinity House, at Westella, at Ferriby, and at The Hall, Kirkella. Plans have also been passed for four houses at Willerby, two houses at Ferriby, and a stable and cowhouse at Sutton.

STOKE-ON-TRENT.—A L.G. Board enquiry with respect to an application by the Town Council for sanction to borrow £700 for the extension of the market yard, has been held. The proposed loan is the estimated sum required for the acquisition of five cottages in Welch Street, their partial demolition, and the conversion of the site for the purpose of extending the yard of the borough market, and for improving the means of access to it. The inspector was also asked to consider an application to the Board for sanction to borrow £300 for a proposed further improvement of London Road.

WATFORD.—The following plans, among others, have been approved by the Urban Council: Five houses, Field Road, for Mr. H. W. Grover; house, The Avenue, Nascot Estate, for Mr. J. R. Cuthbertson; house, Oxhey Avenue, for Mr. A. E. Taylor; detached house, Eastbury Road, for Messrs. Clark Bros.; new skating rink, Clarendon Road, for the Skating Rink Company, subject to conditions; new front and colonnade, Palace Theatre, for the Watford Theatre Company, subject to conditions.

Federation News.

SHEFFIELD ASSOCIATION.

Secretary: T. Smith.

The monthly meeting of Sheffield Association was held on October 14th, when there was a good attendance of members. The president, Mr. W. W. Mears, was in the chair.

The correspondence included a letter from the Yorkshire Federation covering a copy of the amended general rules agreed between the National Federation and the N.A.M. and N.A.O.P., requesting the Association to confer with the N.A.M.P. with the object of appointing the representation. The matter was left over till next meeting, it being desired to confer with other local associations in the meantime. Other letters included a request from the Treasurer of the Yorkshire Federation for further subscriptions, and also contributions to the National Reserve Fund. With respect to the former it was pointed out that for the current year the Sheffield Association had already paid £40 on account, and would probably make a further remittance next month. With respect to the National Reserve Fund, the secretary was instructed to enquire how this was apportioned amongst the various associations in the Federation, and specially to ascertain what was the proportion allocated to Sheffield, which had previously contributed £50. The secretary was also to ascertain what amounts respectively had been allocated and contributed by other associations in the Federation since the inception of the scheme.

The motion in the name of Mr. Forsdike that a uniform rate of profit of 2d. per hour on wages of tradesmen, and 1½d. per hour on labourers be paid, led to a somewhat animated discussion. Mr. Forsdike voiced the opinion of the majority in holding that the rate of profit proposed was fair and reasonable.—Mr. Powell spoke against the resolution.

Mr. Roper seconded the resolution.—Messrs. Brown and Ardern pointed to existing difficulties, but Mr. Belton took the opposite view.

Mr. Biggin thought the proposal reasonable.—Mr. Boot did not see any difficulty.—The President pointed out that the resolution could do no harm, and it would at any rate establish a standard which would be recognised in court if need be. Mr. Moore leaned a little to the opinion of Mr. Powell, but Mr. Forsdike, having pointed out that he was willing to have his motion considered "non-committal," the president put the resolution, which was supported by Mr. Unwin, and carried.—A further resolution moved by Mr. Boot, and seconded by Mr. Unwin, instructed the committee to prepare a list of the various trades to be sent to the architects.

The Secretary, in presenting to the meeting a rough printer's proof of the new Calendar for 1910, remarked that the Sheffield Association had acquired the reputation of being one of the most progressive associations not only in the North, but throughout the country, and they wanted to retain the reputation. To this end the calendar was proposed to be sent out in embryo to such persons and firms as existing members returned on the forms, which would be sent out containing on one side a reference to the inter-trading rule, and on the other provision for the names, addresses and businesses of persons with whom they were trading. The return would be quite anonymous, so that the forms when filled up would not divulge the name of the firm which made it. It was an advantage for the name of a merchant firm to be given by several members.

A report was given of the meeting of the Trades' Committee held the previous evening, when Mr. A. J. Forsdike presided, and there were also present Messrs. W. W. Mears (president), J. Biggin, J. D. Cook, W. Longden, T. Roper, G. E. Powell, Jas. Wilkinson, T. Eshelby, T. H. Gray, Chas. Boot, and G. W. Forsdike. The General Union of Carpenters and Joiners were represented by Messrs. J. H. Blincow and F. H. Kent, and Manchester Order of Bricklayers, Messrs. H. A. Stone and T. Kelly. The Amalgamated Society of Carpenters and Joiners, Messrs. T. Wood, F. W. Lindley and W. Lane, and London Order of Bricklayers by Messrs. J. H. Parker, J. L. Evans and G. Emerson. The meeting arose out of previous meetings held March 5th and June 2nd, which had been called to discuss the advisability of the abolition of walking time. The Association had been compelled to give six months' notice on the 1st September to abolish the walking time rule, and, at the same time, they had given notice for reduction of wages ½d. per hour, and the alteration of any other rule which might be necessary or advisable. To this both the Joiners' and Bricklayers' Societies had replied with counter-notices demanding: (1) Increase of wages ½d. per hour; (2) return to old limit of 1½ miles from Parish Church for walking time, employer to pay tram or train fares beyond that distance, and rule to apply to men set on the job as well as men sent from contractor's place of business; (3) increase in wages for joiners' overtime which would alter present rate of 10d. per hour for first 2 hours to time and quarter, or 11¼d. and present rate of 1s. per hour after first 2 hours for first five days of week to time and half or 1s. 1½d. per hour, and first and second two hours after one o'clock on Saturdays from 10d. and 1s. respectively, and afterwards double time, to time and half or 1s. 1½d. from 1 to 5 on Saturdays; (4) one hour's notice to be given to or by bricklayers on leaving, full wages due to be paid at expiration of such notice; (5) the alteration of any other rule to bring the rules into conformity with the suggestions enumerated.

Mr. Forsdike opened the meeting, and suggested that the secretary should read the reports of the previous meetings, and any correspondence thereon.

The Secretary, having read the reports and letters, suggested that the operatives should explain the position taken up in their counter-notice.

Mr. F. W. Lindley said the chairman had inferred that this question could have been proceeded with under the rules of the Conciliation Board, which rules, he held, did not affect in any way the working rules of the operatives. The Chairman said that that was his impression, and forthwith Mr. Lindley said they had a right to claim 6 months' notice for alteration of rules. In reply, the Secretary read rule 1 of the Conciliation Board, which stated definitely that the Conciliation Board were competent to deal with *all* questions or disputes, and "rules" were there specifically mentioned. On a strict interpretation of rules, he therefore held that the employers or operatives had a perfect right to refer the matter to the Conciliation Board after the lapse of time prescribed in rule 2, though the fact that they had already discussed the matter for more than 6 months, and had now given a further six months' notice was ample evidence that they had no wish to do so.

Mr. Stone thought they might agree with much of what the secretary had said, but he held that the rules of the Conciliation Board were not a substitute for the working rules, and only became operative when a dispute took place, i.e., until the 6 months' notice had expired. Up till then it was a matter of friendly discussion.

The Secretary, in reply, said the matter rested on the misinterpretation Mr. Stone placed on the word "dispute," which, in its ordinary meaning, meant nothing more or less than a discussion in which there was divergence of opinion. The error was made that a dispute implied that there was "bad blood," which was a signification which the word in itself did not bear. There was no denying the fact that a dispute commenced the moment two parties failed to agree, and a dispute therefore commenced with the issue of a notice unless the issuing party knew that the matter would be fully accepted without question by the other side. The matter, however, was, in the present instance, trivial, and did not affect them, and could usefully be allowed to drop.

Mr. Stone, speaking on the main issue, referred to conditions in 1877, when wages were 9d. and walking boundary 1 mile from Parish Church, and there were no trams. Now the boundaries were 2½ miles, with wages 9½d., and car fares cost 2s. per week. If they were to go back to the wages of 1877, it was logical they should go back to the easier conditions then prevailing, with "smoking time." etc.

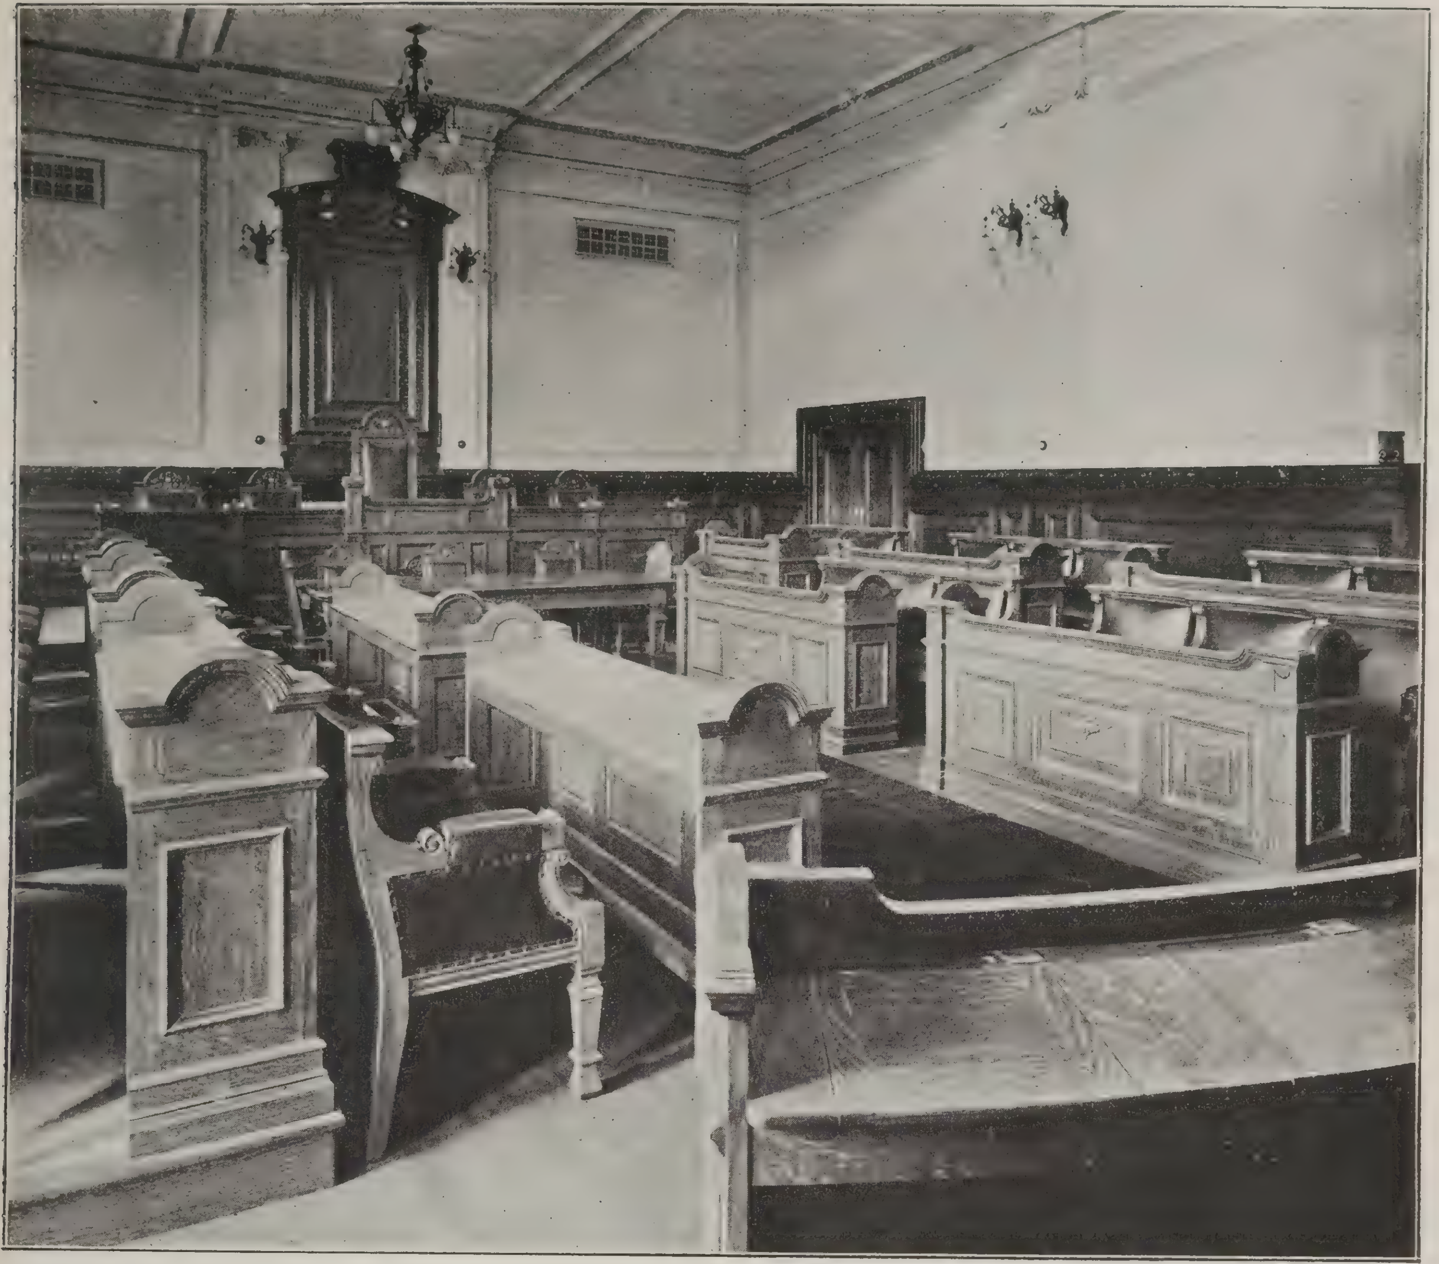
Mr. Wood, while not wishing to say anything in favour of walking time, could not recall a large city where overtime was paid to joiners on such a paltry scale. In asking to be put on same basis as bricklayers—time and quarter for first two hours and time and half after—he thought it would be conceded that their claim was reasonable.

Mr. Stone, in support of advance of wages of bricklayers, quoted the 10d. rate prevailing in Lancashire, but the chairman held that the comparison was unfair, and that Mr. Stone should confine himself to Yorkshire.

Mr. Lane said the walking time they calculated was equivalent to ½d. per hour, and as the masters had said many times that wages were low enough he thought their claim was fair. Other towns were getting a rise of wages, and if the matter went to the Conciliation Board, he thought they would succeed.

Mr. Wood said they wanted it to be distinctly understood that a man commencing in the middle of the week, and working overtime, should be paid overtime rate.

Mr. Evans said that with regard to one hour's notice to bricklayers, there was probably nothing to discuss, as the employers had



DEPTFORD TOWN HALL: THE COUNCIL CHAMBER. LANCHESTER & RICKARDS, FF.R.I.B.A. ARCHITECTS
The furniture here was not designed by the Architects.

already said they would agree to it. The Chairman, in reply, said they were now starting afresh; but in reply to the question direct from Mr. Evans, said that he had no reason to suppose that the Association wished to withdraw. They asked for 3s. per week lodging money on jobs over 4 miles from Parish Church, and return fare once a fortnight, and an increase of ½d. per hour. Would the employers give them ½d. per hour increase if they gave up walking time?

The Chairman, replying on the whole position, said that they were all agreed at that end of the table that this was no time for raising wages. The fact that they had put a reduction of wages in their notice was entirely the operatives' fault. They had fought against it tooth and nail. He would like them to say what proportion of men received walking time, as he thought they took a most extravagant view of it. It was not true that in abolishing walking time they were attempting to reduce wages 2s. per week. The wages would remain precisely as they were, the only difference being that men would get up and work 10, 15 or 20 minutes more instead of being paid for this time in walking or waiting for others to come up, a matter which caused them an enormous amount of trouble, not in contract, but jobbing work, in which the proprietor reckoned up how many hours he was paying for, which were not worked. They were not asking for something which did not obtain in other large towns, and in cases where walking time was paid there was a provision that it did not apply to men set on on the job. At Sheffield, they knew that the rule had not been carried out, and what they wanted was a rule to which they could adhere. He did not think walking time affected 10 per cent. of the workmen, perhaps not 5 per cent.

Messrs. Lane, Wood, and Stone pressed their previous points.

Mr. Biggin endorsed the remarks of the chairman, and proceeded to mention towns where walking time was not allowed. What, however, concerned them the most was the right to compete on equal terms with outside contractors by setting men on on the job without walking time being demanded, and that did not reduce wages one iota.

Mr. Boot said men did not live in the centre of the town, as they used to do, and many times lived in the suburbs where the work was situate. He knew an instance where men paid 4d. a day train fare to a job not outside the boundary, but in such cases, rule or no rule, the matter received considerate notice by the firms who sent the men. The burning question was to find men more employment and increase of wages, and stringent and unfair conditions which increased the cost of work would not do it. In asking for abolition of walking time, they were not wishing to take anything away, but in the main to regularize existing conditions.

Mr. Wilkinson held that the operatives were going directly against their own interests. They had not to consider the individual interest of one side or the other, but how they could jointly face existing circumstances, otherwise they would both go to the workhouse together.

The discussion went on in desultory fashion for nearly three hours, the operatives' representatives claiming a paradox in the statement that the employers held that the walking time was a matter affecting few workmen, while making so great a difference in the aggregate, while they held that what the employers gained the operatives lost, but in this contention they did not take into account the jobs which were altogether lost to local contractors, who lost the profit and the workmen the wages except they worked for outside contractors (as they sometimes did) under conditions they refused to concede to the local contractors.

Mr. Wilkinson spoke of a job taken by an outside builder who was able to quote some £300 less than any builder round that table, and then proceeded to mention a job on which his firm was engaged at the moment which was quoted for on the perfectly honest ground that walking time was not operative, and the result of their paying the men per week extra was that they would lose £137. It was pointed out that Mr. Wilkinson was in this instance recognising walking time in a trade in which it was not operative, but Mr. Wilkinson said he refused to take advantage of a workman and act partially, and he consequently gave the same allowance to stonemasons who were not entitled to it, and to the poor labourer, who was in a similar position, and had no local Trade Society to protect his interests.

The operatives' representatives said they could not go back to their respective societies with nothing to offer in lieu of walking time. Mr. Evans suggested that the walking boundary should remain as it was, and that 1s. per week extra be paid to all men working beyond 2½ miles radius, such advance to apply to Society men only. The Chairman replied that they could not recognise that, and, in further reply to Mr. Evans, they could not recognise it without the reservation as to Society men. In reply to Mr. Lindley, he thought it was a most extreme and extravagant thing to ask for walking time to apply, and all men to start at the same time. It meant that the operatives wished to be paid for doing nothing.

Eventually the meeting broke up with a suggestion from Mr. Stone, which has been subsequently confirmed by letter. "That 1s. per week shall be allowed for car fares to all men working on jobs over 2½ miles' radius up to 4 miles, men to be on the job at the usual starting time; wages to remain as at present." This position the Chairman promised to place before the Association, but it still leaves the other matters unsettled. At the meeting of the Association it was decided that the whole matter should be considered in committee, and presented as a report to next meeting.

NATIONAL ASSOCIATION OF MASTER PLASTERERS.

Secretary: Geo. Soall.

The half-yearly general meeting of the above association took place at the Moseley Hotel, Piccadilly, Manchester, on Thursday, October 21st, the president, Mr. T. Lindley, in the chair. The minutes of the previous meeting, and apologies received, having been read and accepted, the representatives of this association upon the Executive Council of the Confederated Associations of Master Plasterers, Plumbers, and Slaters, made their report upon the recommendation of that body, and that a general meeting of the whole of its members should be held at a suitable date, to consider matters that are of interest to the members in their position of sub-contractors, such as payments, single tendering, etc., etc., and that a resolution from this association be submitted to the meeting.

It was decided to hold the annual general meeting at Leeds.

Law Case.

Waiting for Wages.

In the King's Bench Division, before Mr. Justice Darling and Mr. Justice Bucknill, the case of Harper v. Linthorpe Dinsdale Smelting Company (Ltd.) raised a novel point.

The case was an appeal by the defendants from the decision of the County Court Judge sitting at Middlesbrough. Plaintiff, with other men, had been employed as a bricklayer by the defendants. He was working on night shift, and on January 27 last he was given notice at 5 o'clock in the morning that his employment would end at 6 o'clock. Upon the termination of his employment a sum of £5 4s. 8d. was due to plaintiff, and at 6 o'clock he went to the office of the defendants to receive the amount to which he was entitled. There was no one there to pay him at the time, and he was eventually kept waiting until 10.45, when he received his money. He brought an action against the defendants claiming 3s. 11d. for loss of time owing to the defendants' delay in paying the wages due to him. Evidence was given before the County Court Judge that it was usual to pay the workmen's wages at the expiration of the hour's notice given to them, so that there might be no delay in applying for another job. The County Court Judge gave judgement for the plaintiff for the amount claimed, upon the ground that it was unreasonable to expect him to wait for some hours for his money after being dismissed at an hour's notice. The defendants, as stated, appealed.—Mr. Hedley, on their behalf, contended that the decision of the Judge was wrong. Even supposing that the plaintiff had a legal right to payment at once and a claim for damages if he was not paid immediately, the case of "Tetley v. Wanless" (L.R., 2 Ex., 257) showed that a payment in satisfaction and discharge of a debt was a payment in satisfaction and discharge of the nominal damages to which the creditor might be entitled for the detention of the money due to him. Further, in the present case, there was no evidence of a custom by which the plaintiff might be entitled to receive the amount, or of any contract, express or implied, entitling him to it.—Mr. Lowenthal, for the plaintiff, contended that the fact that the plaintiff was told to wait for his money was sufficient to enable the Judge to imply a contract that he should be paid for the time occupied in so waiting.—The Court allowed the appeal, and Mr. Justice Darling, in giving judgment, said that there was nothing to show that the moment the plaintiff left off work he was not entitled to go away. He had ceased to be the defendants' bricklayer. They were no longer bound to provide him with work, and he was not bound to stay with them. He was entitled to have his money at once, but it was not ready for him, so that if he wanted to take the money away with him he would be obliged to wait. There was no doubt at all that a creditor was not ordinarily entitled to damages because there was a delay in paying a debt due to him, but the law provided in some cases that a creditor should be entitled to interest on his debt, and in other cases he might be entitled to nominal damages for being kept waiting. But it was also a rule of law, laid down by Mr. Justice Maule in "Beaumont v. Greathead" (2 C.B., at p. 499), and recognised and approved in "Tetley v. Wanless," that if a creditor accepted payment of his debt before action, such payment was a payment of the debt, and the nominal damages as well, and thereafter there could be no claim for damages. The plaintiff here had accepted the money due to him, and therefore if he had ever had any sort of right to nominal damages he had sacrificed it by taking the money before he brought his action. It was suggested on behalf of the plaintiff that there was a custom in such a case as the present that if a man was kept waiting for his money he was entitled to be paid for so doing. That was a custom which did not apply to other people to whom money was due. It did not apply to a tailor, for instance, or to a barrister who was kept waiting for his fees. Mr. Lowenthal had frankly admitted that there was no real evidence of such a custom in the present case. Upon what then did he rely? He (Mr. Lowenthal) contended that there was evidence from which it might be implied that the men were to be paid for waiting, although it was contrary to the general law, and there was no custom to that effect. He (Mr. Justice Darling) saw no evidence to support that contention. It was said that the plaintiff was bound to wait until the money was paid to him, but there was no evidence to show that he was not free to go away. He could have come back for his money later, or have sent for it. For his own purposes the plaintiff waited for his money, and he was no more entitled to be paid for waiting, on the evidence before them, than any ordinary creditor who had to wait for his money. He was of opinion that there was no evidence upon which the County Court Judge could found his judgment that there was an implied contract by the master to pay the plaintiff for waiting for his wages, and the appeal must be allowed.—Mr. Justice Bucknill delivered judgment to the same effect.

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted, although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

R.I.B.A. Polity and Progress. Mr. Ernest George's presidential address to the R.I.B.A., received just in time to be printed in last week's issue, but too late for comment, was not elaborate in composition, but was extremely interesting in the details. It opened with the very gratifying if dubiously accurate announcement that in a few months the Institute will be "suitably housed." To increase one's accommodation is not necessarily to be "suitably housed." The R.I.B.A. ought surely to build for itself, and to do it in the Grand Manner. But, as the President remarked with regard to the growth of architecture, "changes come by degrees," and this step towards expansion will gratify, although it does not satisfy. Turning to general topics, Mr. George observed that in this country we have admirable builders, craftsmen and workmen equal to the best, and young architects who at least are receiving a better training than was common a generation ago. Moreover, their opportunities are being still further enlarged. The scheme for the founding of a British Architectural School of Rome is taking shape, Mr. John Simpson having drawn up a practical working basis for consideration; and probably, in building upon this basis, Sir Brumwell Thomas's proposal for a Diploma School, where architectural study would be carried further than in the ordinary course of training, and whose students would compete for the Prix de Rome—we trust that a sufficiently dignified English name may be found for it—will not be neglected. Town planning or civic design—the rival terms are supposed to be struggling for supremacy, but seem to us to express or suggest different ideas—naturally came into the address, but was not greatly illuminated, although the announcement is welcome that the Institute Committee for the study and elucidation of the subject is likely to organise a conference on it. There was a timely reference to bridges, with two very pertinent questions: (1) "Is there any reason why a Thames bridge built now should have less dignity and propriety than London Bridge and Waterloo Bridge?" We should say that the answer is in the negative: the art, the men, and the money being no doubt available. (2) "Is there not a shoddy and commercial appearance about most of the later attempts to span the river—a lack of monumental fitness?" We are afraid that the answer must be in the affirmative; and since, as Mr. George observed, "the bridges of a great city are the features that most impress the mind and remain on the memory," the city owes it to itself to see that none of its bridges are allowed to fall short of the high standard attained by the two bridges cited. Also the City Guildhall should surely express or reflect the City's greatness, and we would join with Mr. George in begging the Corporation to decide on a comprehensive plan on a grand scale, so that when foreign guests are entertained there they may not have reason to think meanly of our ideas of civic design. The exaggeration or distortion of art values from which, as a nation, we are still suffering acutely, was justly criticised. While, as Mr. George acknowledged, it is gratifying to see how large sums have been forthcoming when a picture has had to be secured for the nation, it is nevertheless obvious that "the cost of five Old Masters (in the present artificially inflated state of the market) would provide a noble building in which Drama or Music should be housed, receiving tributes from sculptor and painter," and that while canvas pictures are being secured at exaggerated cost, "the cheapening process is applied to public buildings and works that might have an exalting influence," being "the common property of all," because patent to all beholders. Very welcome are the two announcements with which the pithy address concludes—that a winter exhibition of architecture and the contributory arts is to be held at Burlington House, and that the basis of the Royal Institute is to be broadened under its new charter and revised by-laws, when "we are to ask Parliament for higher powers and a more secure position;" which elegant periphrase, being interpreted, seems to spell "Registration."

Tendering for the Supply of Bills of Quantities. The Council of the Metropolitan Borough of Deptford is inviting tenders from quantity surveyors for the preparation of the bills of quantities for a small library they are about to erect. From the fact that their advertisement has only recently appeared, it is probable that its issue was decided upon at the last meeting of the Council previous to the elections, and it is no doubt intended as a reminder to their constituents that their representatives effect a substantial saving of the ratepayers' money whenever possible. The election addresses of those candidates who were successful at the Borough Council elections three years ago are not before us. They, however, no doubt evinced their authors' determination to "save the rates" (a stock phrase without which none of these addresses are complete), and we fully recognise that promises made on these occasions must (if possible) be redeemed. At the same time we strongly deprecate the practice of inviting tenders from quantity surveyors, which is, in our opinion, a most undesirable method of engaging professional services. Any small saving in fees which may be effected by its adoption is more than counterbalanced by the loss to the public which is sustained through the issue of improperly prepared quantities. It is a curious fact that it is mainly those public authorities in whose membership the trades union element largely predominates which seek to lower the professional standard by reducing the fees for professional services to a point at which they are not remunerative to a properly qualified man. Deptford itself is a typical instance, the population of which is largely employed in one or other of the industrial undertakings carried on within its area, which has a well-known trades unionist representative in Parliament and on the County Council, and which has usually (we believe) a trades unionist majority on the local Council. These authorities to which we refer invariably insist on the insertion of a trades union clause in their building contracts, under which a contractor is compelled to pay the recognised rates and observe the union hours of labour, yet, with singular inconsistency, when it comes to a question of engaging a surveyor, they ignore the very moderate scale of charges issued by the Quantity Surveyors' Association and adopt, to quote John Ruskin in "Unto this Last," "the false, unnatural and destructive system under which the bad workman is allowed to offer his work at half-price and either take the place of the good or force him by his competition to work for an inadequate sum." Protests against the Deptford Borough Council's action will no doubt be made by those professional societies to which quantity surveyors belong. We must, however, confess that we are not very sanguine of the success of any "protests," and, in our opinion, the only relief from a position which threatens to become intolerable is to be obtained by the formation of a very strong and representative trades union for quantity surveyors, or, in other words, by the enrolment of all those whose work mainly consists in taking out quantities in the ranks of the Quantity Surveyors' Association.

German-made Scottish Schools.

Leith School Board is gaining a very unenviable notoriety. Wanting two new schools, it must needs go to Germany for them. The schools, so far as our information goes, are to be temporary, and that, we understand, is the ostensible reason for adopting a German system in which the walls are removable. Now, quite apart from any merits that the system may possess—and its applicability to the circumstances has been hotly challenged—surely this is no time for bestowing upon foreigners the work and money of which British builders are so sorely in need. The depression of trade in Edinburgh is, if possible, even worse than it is in other parts of the country. As one of the speakers at a protest meeting remarked, the Board, at the very moment when it finds itself obliged to consider the question of feeding hungry school-children, is simultaneously "depriving the parents of the means of keeping body and soul together," since about forty per cent. of the £13,000 or £14,000 which these schools are to cost will go to Germany. We do not wonder that a strong protest has been entered against this amazingly inopportune transaction, but we are certainly surprised that the protesters were able to restrain their natural anger within the bounds of moderation. Their not undignified remonstrance may perhaps have the desired effect of preventing this ill-advised and most unfortunate experiment, and for this reason we are for the moment disposed to follow their example. But, nevertheless, we also lodge our most emphatic protest against the inexplicable and apparently inexcusable folly of employing foreigners to do work that we are quite confident could be done at least as well by builders on the spot; for, apparently, the Board have not even the poor excuse—so commonly put forward by authorities perpetrating similar sins against patriotism and propriety—that they are thereby saving the ratepayer's pocket. We trust that the Board will yet be able to avert the odium that it must certainly incur if it perseveres in this extraordinarily ill-timed and capricious adventure. At any time, and in any circumstances, it would be difficult to justify; at the present moment it is equally impossible to understand or to condone it, and we trust that the Edinburgh builders will fight against it *à outrance*, and, if necessary, invoke the powerful aid of the National Federation.

The L.C.C. and the Mistress Art.

The London County Council has, we fear, taken a false step with regard to architecture. At last week's meeting, the General Purposes Committee recommended that as from January 1st, 1910, the educational architectural work be placed under the charge of the architect, and that the staff of the Department of the Architect (Education) be transferred on that date to the Department of the Architect. Mr. W. H. Key moved as an amendment that the recommendation be referred back to the General Purposes Committee with instructions after conference with the Education Committee to report as to the appointment of one chief officer to have control of the whole of the educational architectural work of the Council. Mr. Key read a manifesto signed by several London architects. The document stated that it was most undesirable that structural and statutory architectural work of the Council should be carried out by one official, and that the evil would be greatly aggravated if the structural work of the Education Committee was thrown upon the department. That view, they believed, was also held by the majority of architects who had the future of London buildings at heart. The qualities which were required for the statutory work were not those which should be essential for the official having the design of the Council's various buildings under his charge, and they believed that the dividing of the work of the Council's architect was the proper solution of the difficulty. The manifesto further stated that were not the meeting at which the protest was to be made so imminent its promoters believed that it would have been possible to have laid before the Council a formidable petition from architects bearing out this view. The amendment, after a protracted discussion, was defeated by 62 votes to 33, and the committee's recommendation was then agreed to. Precisely what the London architects meant by "the dividing of the work" is not quite clear. If it simply means that they wished to keep things as they were, and were advocating simple division, we could not yield their contention unconditional support. We are for compound division! That is to say, we have always held, and still hold strongly, that the work of designing buildings required by the Council should be thrown open to general competition. The simple division theory would still hold good. Education, in London, is a big enough subject to demand the services of an architectural expert in that kind, who would find plenty to do in an advisory capacity, but he should not be called upon to design schools. If stereotyped monotony of style and elevation is to be avoided, and if the artistic side of architecture is to receive due attention, the Council must make use of all the talent available. This seems to us to be so obvious a truism that to labour the point would be superfluous to the verge of boredom. As, however, the Council does not seem to be fully alive to its responsibilities with regard to the Mistress Art, we can only hope that this unstatutory obligation will be urged upon them cogently, influentially, and without delay. The R.I.B.A. seems to have missed an excellent opportunity of pressing for a much-needed reform.

A New "Exemplar."

The most effectual method of studying architecture being that of measuring and drawing good work, it is plain that the next best way is to study the drawings thus produced. The value of such drawings is indisputable. The objects that are worth measuring and drawing, although plentiful enough if one knows where to look for them, are not always or generally accessible; and even when these difficulties are overcome, the barriers of time and distance may be insuperable. The student—and every properly constituted architect is a student to his latest day—is therefore glad to have at his disposal the measured drawings of work that is in any way exemplary. He misses, of course, the supreme advantage of seeing it in three dimensions; but, after all, that is no very great drawback, considering that the trained eye of the architect enables him to visualise, from the drawings, the actual and substantial effects. The mere copying of such drawings is no doubt a valuable exercise, more impressive, because ensuring greater concentration, than even the closest inspection in which the pencil is not employed. But, besides their educative value as a means of training the eye and the hand, stimulating the imagination, and increasing the store of mental possessions, they offer patterns and models for adaptation to further uses. This note is suggested by the announcement that the Second Series of "The Exemplar in Architecture" is now on sale, and is to be had at the offices of this journal, price 12s. 6d. nett. This work consists of 112 plates of measured drawings and photographic views of architectural work that is worth studying. Prominent among the details are those of balustrades, ceilings, cornices, doors, gates, piers, and panelling; and the measured drawings are accompanied by fine photographic views. The name of the editor—Mr. Mervyn E. Macartney, F.R.I.B.A., F.S.A., is a sufficient guarantee of the taste and judgment with which the objects have been chosen for illustration. The plates, which are finely printed on stout "art" paper, are not bound together in volume form, but are collected in a neat portfolio, so that each can be detached for convenience of reference or study. With the plate as unit, and the portfolio as section comprising such details as can be appropriately classed together, the "Exemplar" will in process of time form a comprehensive library of architectural examples; each section, however, being quite complete in itself, and unrestricted by any over-rigid system of classification. The Second Series, for instance, is not scrupulously confined to the more or less closely related details which preponderate in it, but shows incidentally some beautiful elevations and interiors. Still, the general plan of the work affords architects an unexampled opportunity of building up, as on the sectional library system, a complete cyclopædia of architectural examples. They should make haste to get the Second Series of the "Exemplar," for it is sure to run out of print very soon.

Coming Events.

Wednesday, November 10.

ROYAL SANITARY INSTITUTE, 90, Buckingham Palace Road, S.W.—Discussion on "The Quality of Effluents in Relation to Standards," opened by Mr. Gilbert J. Fowler, D.Sc.

Monday, November 15.

R.I.B.A.

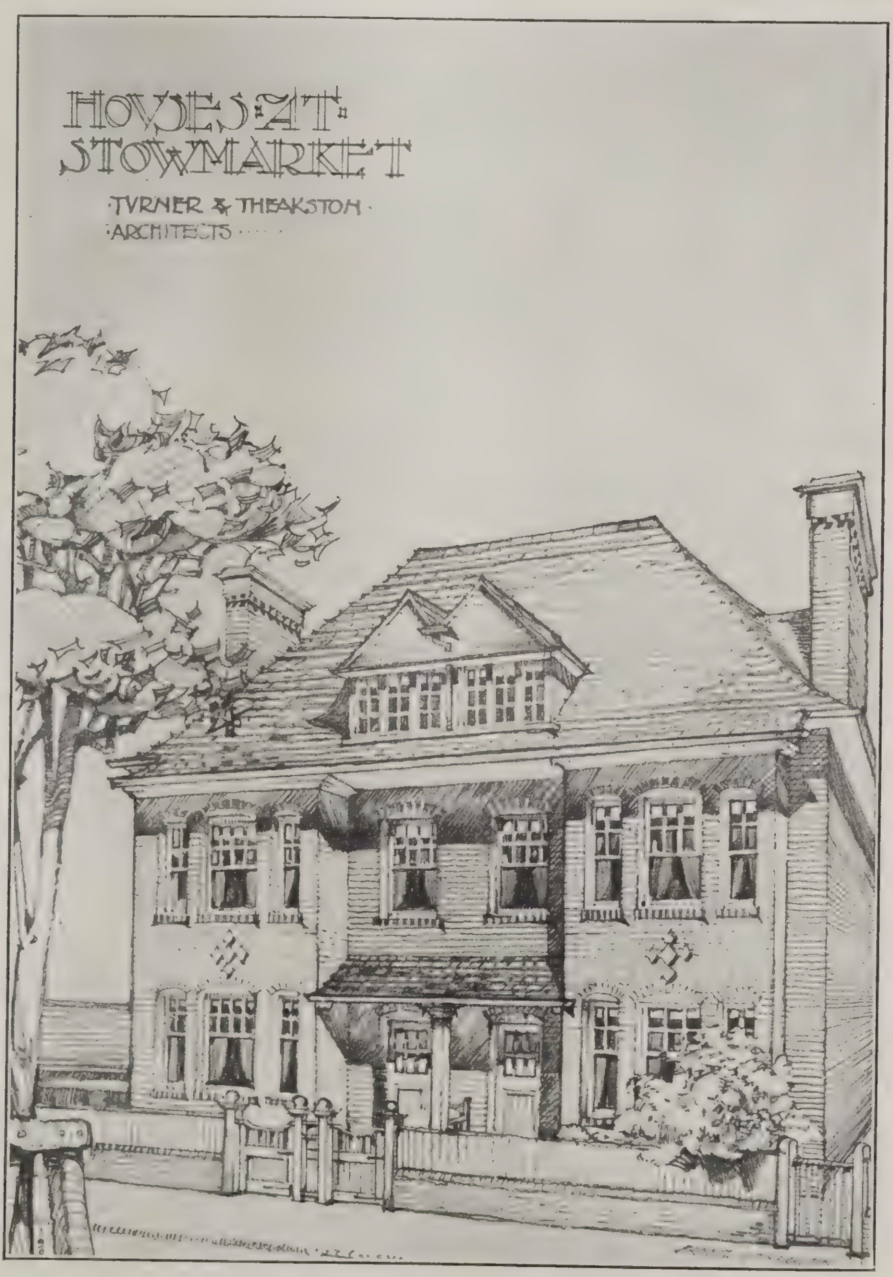
Obituary.

At the meeting of the R.I.B.A., held on Monday, November 1st inst., the honorary secretary regretfully recorded the decease of the following members:—Nathan Solomon Joseph, Associate 1863, Fellow 1890; Frederick Hyde Pownall, Associate 1857, Fellow 1860; Henry Stock, Fellow 1885. Don Jose Urioste y Velada, Hon. Corresponding Member, Madrid, elected 1905; Frederick Henry Williams, Associate 1878; John Wornham Penfold, Associate 1860, Fellow 1881; John Archibald Campbell, Fellow 1906; William Owen, Associate 1879; Auguste Choisy, Hon. Corresponding Member, Royal Gold Medallist 1904; C. Follen McKim, Hon. Corresponding Member, Royal Gold Medallist 1903.

The Royal Gold Medallist and His Work.

The President, Mr. Ernest George, having delivered the address, published in our last issue, then formally presented Dr. Arthur Evans with the Royal Gold Medal.

Dr. Evans, in acknowledging the honour that had been conferred upon him, observed that anything he had done towards lifting the veil from that early civilization could never have been achieved had it not been for the powerful and devoted help of his coworkers. He knew that from some points of view the work with which his activities had been associated could not be compared with the grandiose architecture of Greece. It represented a more primitive age. It showed, however, what an extraordinary advance had been made before the era of classic Greece. Not merely in the details, but in the whole planning, was manifested a remarkable facility of expression; and he was surprised at the extraordinary perfection of the sanitary arrangements. Having acknowledged his gratitude to the British School, and to Dr George Macmillan, without whose collaboration the achievement of the results would have been impossible, Dr. Evans gave a summary account of a communication to the Institute on the Palace of Knossos as a sanctuary, and the miniature frescoes. He drew attention to the evidence that had accumulated throughout the whole course of examination of the religious aspects of the great building. It was a sanctuary as much as a palace, and Minoan kings were also priests. It was unlike other palaces, either of the ancient or the modern world, in which the demands of cult might be satisfied by a single shrine or temple. In some respects it might be compared to the Vatican, for it swarmed with shrines, and had a hall for ritual functions. The evidence of a whole series of finds had now shown that the chief divinity of Minoan Crete was a virgin goddess—akin to Rhea and the Asiatic Artemis. The kings of Knossos seemed to have administered their realm as her high priests Besides the pillars of her shrines and the aniconic image of the goddess, was the sacred double axe; and the wonderful painted sarcophagus discovered by the Italian Mission at Hagia Triada, near the southern coast of Crete, showed actual scenes of worship in which offerings were being made to a pair of these axes, rising from stepped pedestals. The double axe, as was well known, recurred at a later date among the kindred Carian population, as the attribute of their Zeus called, from its native name, Labrys, "Labrandeus," and the view, put forth on philological grounds, that the Cretan Labyrinth derived its name from a dialectic form of the same name, was fully confirmed by the archæological evidence. The Palace of Knossos was, before all things, the "House of the Double Axe," and was thus the true Labyrinth of tradition. Exception had been taken to his view that the double axe, so constantly recurring on the Palace block, was anything but a mere mason's mark, or had any religious signification. Certainly there were many masons' marks on the Palace block besides the double axe. But, in several cases, it could be shown by their distribution that these had a distinct application to the character of the individual parts of the building. Several of these marks, in fact, belonged to the current hieroglyphic system and possessed a recognised ideographic value. The double axe, for instance, could be shown to recur in what appeared to be official titles, and coupled with the Palace sign. It was far more numerously applied to the palace walls than any other sign, and marked the principal lines of wall and entrances, the grand staircase, and the most important reception hall. Its repeated recurrence on the stone pillars rising in the centre of two small basement rooms might, then, be taken to show that they possessed a special sanctity. This view had been doubted when he first put it forth, but the discovery of many other similar pillar rooms exhibiting evidence of religious usage had now put the matter beyond doubt. These pillar rooms were the "crypts" of Minoan sanctuaries. In the south-east house at Knossos, the base of a sacred double axe was actually standing against such a pillar, which itself again was marked by the sacred symbol. Ritual vessels and basins of the same kind were found both in the Palace and elsewhere, either within or in close association with such chambers. The whole west wing of the Palace presented indications of its various halls and chambers having served religious purposes. Besides the central shrine of the goddess, here represented in her nether-world aspect as holding serpents, it was now clear that the chambers contiguous to the room of the Throne contained at least three small shrines, one of which had at first been wrongly supposed to be a kitchen. The Throne Room itself, and neighbouring benches, seemed rather to have belonged to a small consistory of the Priest Kings than to have been intended for any secular usage. At the north-west angle of the Palace near this, had existed another pillar shrine and an upper hall of a ceremonial nature, the wall paintings taken from which exhibited a columnar structure, with pairs of double axes stuck into the capitals, and sacred horns above the stylobate. Other fragments of fresco from the same place showed votaries bearing gold and silver vessels, and others again relegated to the sports of the bull ring, which themselves seemed to have had a religious connection. But the miniature frescoes derived from some sanctuary structure on an upper floor near the northern "piazza," gave the fullest impression of the religious functions of the Palace. Dr. Evans then described the methods by which two complete designs, each forming a separate panel, had been reconstructed from the fragmentary remains. One of these depicted crowds of spectators of



PAIR OF HOUSES, STOWMARKET.

These houses have been erected in Milton Road, Stowmarket, from the designs of Messrs. Philip J. Turner and Ernest G. Theakston, of Stowmarket and London. The walls are faced with local red bricks, and the roofs and dormers covered with red tiles. Mr. Ernest Death, of Stowmarket, is the builder.

both sexes looking on at a dance of gaily-dressed females in a court below, and a discovery made by him this season had supplied a welcome illustration of the character of the performance. From a tomb just excavated near the Royal Tomb, already explored, and on the same interesting structure, he had obtained a gold signet ring with a finely engraved design, the lower part of which exhibited dancing female figures similar in attitude and arrangement to those of the fresco. But in this case, together with sacred emblems, a figure of the great Minoan goddess appeared above in a reserved celestial space. The dance, then, was of a religious and orgiastic character, and in honour of a goddess, who, in a later Hellenic garb, appears as Aphroditê Ariadnê. The court, with dancing votaries depicted on the fresco, which was obviously some part of the actual Palace system, might be taken to represent the actual dancing place of Ariadnê, which Dædalos, according to the Homeric tradition, was said to have fashioned "in broad Knossos." The other panel showed the same crowds of spectators thronging the courts and terraces of a building, the central feature of which was a small, brilliantly coloured pillar shrine with a taller central compartment and two lower wings. It is probable that this might actually represent a shrine existing in the northern quarter of the Palace. Some curious evidence, to which attention was called, seemed to indicate that in the latest period of the remodelled Palace of the west wing, facing the central court, near the place where the repositories of the earlier shrine of the Snake Goddess had been discovered, on the face of a low stylobate bordering the court in this quarter, traces had appeared—made clearer by successive seasons' rains—of two pairs of column bases with an intervening blank space between them, where, according to the typical plan of the Minoan pillar shrines on the fresco, the central cell would have risen. It was noteworthy, moreover, that in the inner space within one of these wings had been found a series of clay seal impressions, showing the great Minoan Goddess on a height between two guardian lions, with a small pillar shrine on one side. These sealings themselves naturally indicated the neighbourhood of a sanctuary; and what made the evidence still more suggestive was the appearance, inside the central space between the pairs of column bases, of a curious recess, in the bottom of which remains of a chest containing documents had been found. Putting two and two together, he had arrived at the conclusion that they had here the more or less complete ground plan of a small Minoan pillar shrine, the plan and elevation of which were then shown on the screen.

Dr. George Macmillan, who proposed a vote of thanks, said that he was pleased to observe in the President's address a reference to the proposed architectural school at Rome. That time last year allusion was made to the matter, which caused something of a flutter in the minds of persons connected with the existing school at Rome. Some thought that the British School was already there. Matters had now been cleared up, however, and he had reason to believe that when the scheme was carried out all friction would be avoided. Those who had not heard Dr. Evans speak could not know what the world of learning owed to his genius. The Crete discoveries revealed not only the scholar, the student, and the explorer, but the man of brilliant imagination.

Mr. George Hubbard, F.S.A., seconded the vote of thanks and gave a eulogistic and interesting description of Dr. Evans's career. In conclusion he observed that Dr. Evans enjoyed the unique distinction of being the fifth generation to put F.R.S. after his name.

The British Uralite Company, Ltd., of 16, St. Helen's Place, London, E.C., have been awarded a diploma and gold medal for their exhibit at the Imperial International Exhibition at the Great White City. The exhibit was a pavilion constructed of the company's well-known fireproof materials—uralite and asbestone.

HOUSE DRAINAGE AND SEWAGE DISPOSAL.*

By W. D. Scott-Moncrieff.

The subject of drainage and sewage disposal is so full of necessary detail that a single lecture is an altogether inadequate medium of instruction, and in domestic sanitation more especially there is nothing that can supply the place of actual practice and experience.

Domestic Sanitation.

The system of disconnecting the house-drain from the sewer has been so generally accepted, and has been so long in almost universal use, that it may be looked upon as a fundamental principle of good domestic sanitation.

Within the last few years this position has not only been attacked, but has been made the subject of argument from quarters that are too influential to be lightly disregarded. At the present moment the question is under the consideration of a Departmental Committee of the Local Government Board, and I am not aware of the architectural profession having taken any strong position as to their claim, their just claim, to take a leading part in the controversy. I am afraid that architects hardly realise the extreme importance of the issues that have been raised.

The First Disconnecting Device.

Many years ago, but within the recollection of many of us, the only protection that existed against the dangerous intrusion of sewer-gas to the interior of our dwellings consisted of an unventilated soil-pipe provided with a D trap, connected to a pan-closet. The idea of making at some point a complete disconnection between the house-drain and the public sewer occurred to me, and no doubt many others, as an obvious precaution, but the honour of having put the proposal into actual practice and giving publicity to the system rests, I believe, with the late Dr. Fergus, of Glasgow, who made a manhole in his back garden on the line of his house-drain, where he fixed an old-fashioned form of trap with a disconnecting channel. This arrangement I saw myself more than thirty years ago, and I was keenly alive to its obvious advantages. Soon afterwards the arrangement first used by Dr. Fergus was improved upon by Mr. Buchan, who introduced an improved form of trap, which bore his name, and became widely adopted in connection with an access chamber. This system of disconnection has remained, with a few changes in details, the standard arrangement ever since, and its adoption has spread all over the civilised world unchallenged until quite recently, when advocates have risen who almost demand that it should no longer be used, and that the disconnecting house-trap should be definitely abandoned.

The first sign of revolt again this widely accepted device of a disconnecting trap, so far as my information goes, came from the surveyor of one of the outlying London District Councils, who undertook the somewhat laborious task of making a systematic note of the actual working of several hundred disconnecting-traps in his own district and tabulating the results. It appears from this examination that the habits of the householders in that neighbourhood were, to say the least, somewhat peculiar, and seem to have been principally characterised by their indifference to the disappearance of their scrubbing-brushes, which the inspectors discovered in their disconnecting-traps. I think the obvious objection to making this information a ground for doing away with disconnecting-traps altogether is that it would not apply to other districts where the inhabitants are less indifferent to the disappearance of their domestic appliances, and where a similar investigation would give totally different results.

The other argument used was of a very different kind, and consisted of a suggestion or claim or demand that the local authorities should be free to make use of the ventilated soil pipes of the householders as a means for solving the problem of sewer ventilation which surveyors have been unable to achieve in any other way.

To this proposal I think there are many serious objections, and the interests, as well as the principles, that are at stake are of such importance that I hope my referring to them very shortly will not be considered out of place. The argument that a certain amount of carelessness is unavoidable in the cheaper kind of houses occupied by people who are altogether indifferent to what goes on with their drainage, as I have said, disappears with the facts supporting it, and can carry no weight where the carelessness referred to does not exist. The other argument, that the traps interfere with the use of soil pipes for the ventilation of the public sewers so as to avoid the use of street gratings, is in a quite different category. It is true that having sewer gratings on the level of the streets is not a sanitary arrangement; but, because sewer ventilation still offers many difficulties, it would surely be a mistake to interfere with the perfection that has been attained in our domestic sanitation by mixing it up with defects in the public sewers, with regard to which great efforts are now being made to find a remedy. In certain states of the atmosphere, and especially when the weather is calm, it would be a most risky system that provided for foul sewers being ventilated through the house-drains and soil pipes where the gases would be absorbed by the water in the traps, and discharged as foul odours in the interior of the houses themselves. Against this most serious occurrence there could not be a remedy of any kind, because the disconnection of which the trap is a necessary adjunct would be prohibited by the by-laws which it is proposed to alter in order to give effect to the new proposals.

Self-cleaning Sewers.

Referring to the sewers, Sir Robert Rawlinson, who was a past-master in their construction, laid down the apparently reasonable proposition that if they were laid with an adequate fall and were efficiently flushed, they would be self-cleansing, and that being so, their ventilation would be a simple operation if there were no foul gases to be dealt with. This seemed to be a simple solution of the problem by the expedient of avoiding the existence of the difficulty.

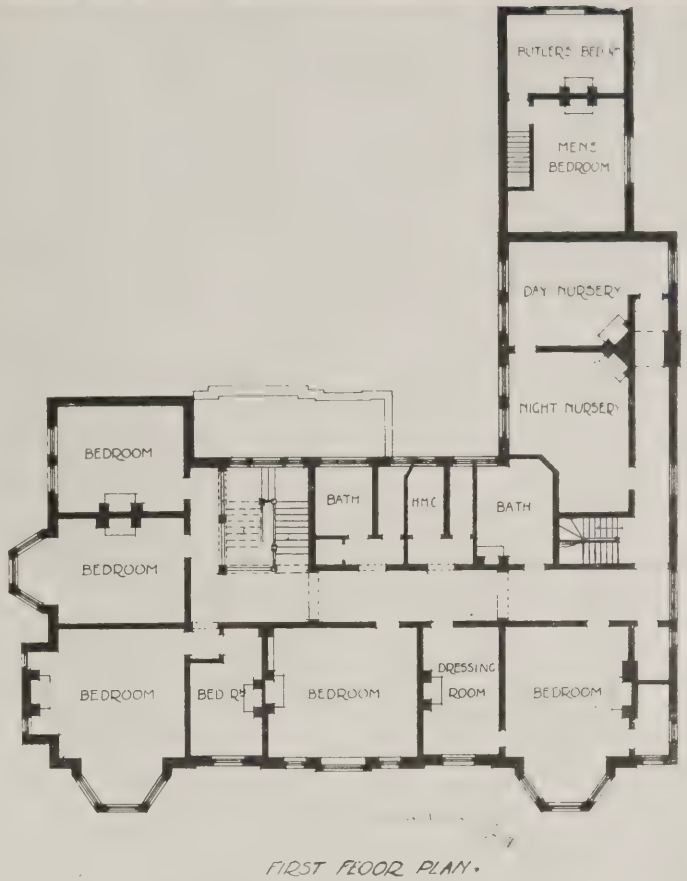
I do not know if there are any sewers that comply with the conditions he suggested, and in which no nuisance has ever occurred, but it has transpired in ordinary practice that even sewers with ample falls and efficient flushing still give rise to emanations from the street gratings. It should be observed that in practice the flow varies greatly at different hours of the day and night, and that this must involve the existence of large surfaces that are so fouled as to give rise to the odours complained of. It has also been found that the movement of the air in sewers is of the most erratic kind, due to wind and other causes, and that arrangements that work admirably under certain conditions altogether fail owing to sudden changes which it is impossible to control.

It is difficult to arrive at reliable information as to the immediate effect of the existing arrangements upon the public health, because other conditions overlap so as to make it difficult to fix upon the one which is really accountable for the different death rates. There is certainly no immunity on account of a rapid fall in a particular line of sewers, because the gases may find their way most freely to the highest level, and the escape from the street gratings may be as bad, or even worse, at the top than at the bottom of the incline.

As matters stand at present it really amounts to this, that a sewer open from end to end, or, in other words, a well-constructed ditch, is just as much or as little likely to be a danger to health as a sewer with its foul gases escaping in a more concentrated form at any particular point. In this connection it may be well to refer to the experience of Bristol, where no system of ventilation has yet been found which could be adopted in any one district of the city without being detrimental to others, and, this being so, they have not provided sewer ventilation of any kind. All the same, the houses have been provided with disconnecting-traps, and there is no evidence to be found in the death rates arising from diseases in any way attributable to sewer gas that can be regarded as unfavourable to the existing arrangements when compared with the death rate of other towns where the sewers are ventilated throughout. In any case, it seems a poor remedy for any evils that may exist to ventilate the gases from the sewers on or about the level of the windows where the great majority of the occupants are in the habit of sleeping. My apology for having said so much upon this aspect of domestic sanitation must be that it is a matter seriously affecting the interests of architects' clients, and that the revolutionary proposals I have referred to ought to have their very serious consideration.

---

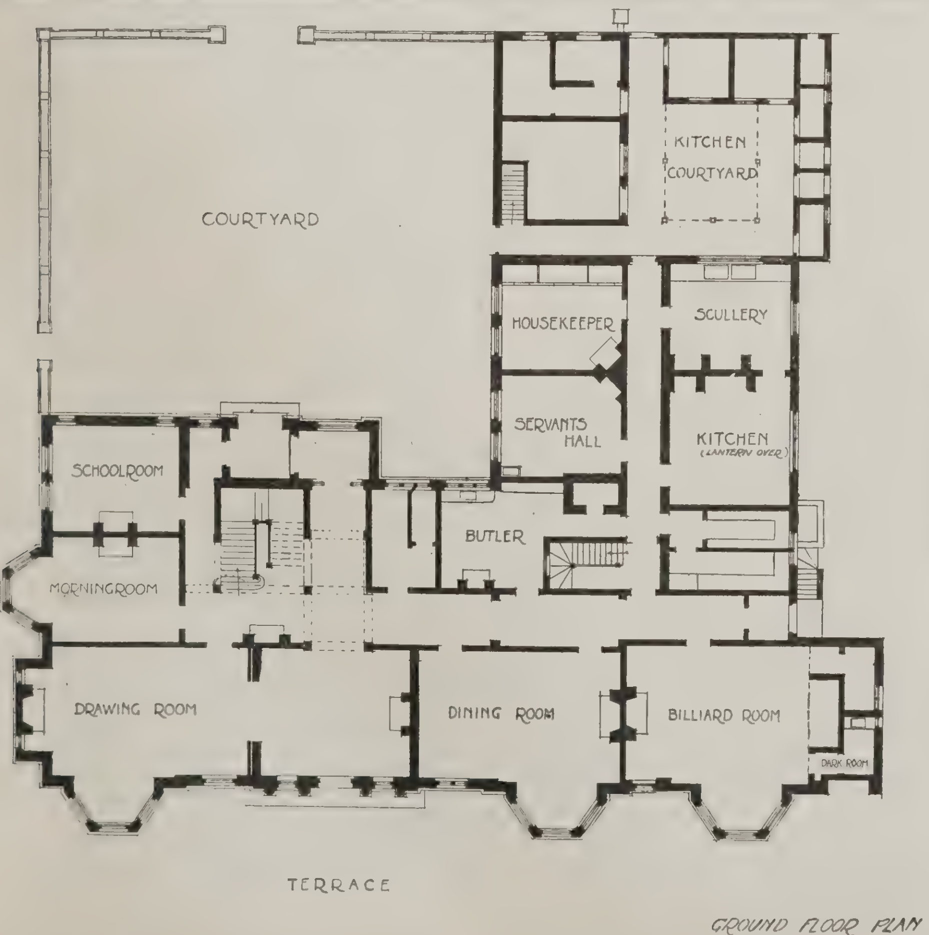
*Abstract of a paper read before the Architectural Association on November 5th, 1909, by Mr. W. D. Scott-Moncrieff.



THE RED HOUSE, CROMER. G. J. AND F. W. SKIPPER, ARCHITECTS.
(See centre plate.)

The Water Test.

A question often arises as to the amount of defect in an existing drain which justifies a recommendation for its complete renewal. The method that has been adopted for many years and which has superseded all other devices is the water test. In the case of stoneware pipes this is a severe test, and it is doubtful whether it can always be regarded as a fair one. With so many joints made in a way that is never dreamt of as a practical means of bearing water pressure in other cases, such as the conveyance of a water supply, it seems strange that it should be justified in a conduit that is condemned if it is not water-tight when it happens to be used as a drain. Recent opinion as to the relation between bad smells and disease has not confirmed the extreme views that prevailed a few years ago, and in any case no one suggests that a slight leakage of sewage several feet below the level of the ground even inside a house can be a serious danger to the health of the inmates. If this were so, it is obvious that, *pro rata*, a well-manured garden would be almost certain death. Whether this view is a right one or not, if an architect does not condemn a drain for the smallest leakage that is perceptible under a water test, it is fairly certain that some other expert, if he is called in, will find it incumbent on him to do so, and in that event the architect who ventured upon taking a common-sense estimate of the danger will be looked upon by his quondam client as a man who did not understand his own business. As a matter of fact, this has often occurred in practice, and new drains one after another have been frequently condemned in the same house on a change of tenancy or ownership for some trifling failure in an arrangement which in practice is never subjected to a water pressure greater than that of the passing sewage, which is practically no pressure at all. It was from the consideration of these difficulties that I made up my mind long ago to look at the question, not from the relative merits of stoneware or cast-iron, *per se*, as the best material for the construction of house-drain as if the water test had not come into vogue, but from the point of view as to which was best able to stand the test when applied. This was more than twenty-five years ago. The first large building which was redrained throughout with cast-iron pipes in London was the Foundling Hospital, where I was allowed a free hand, but it was several years before the architectural profession began to see the necessity of considering the subject mainly from the point of view of the water test. It is obvious that, in the case of cast-iron pipes and connections, the whole system should be capable of standing a high pressure of water without the slightest leakage, and that if any occurs the architect is quite justified in condemning them.



THE RED HOUSE, CROMER. G. J. AND F. W. SKIPPER, ARCHITECTS. *(See centre plate.)*

Early Domestic Sanitation.

In looking back upon the early days of domestic sanitation, I remember the enthusiasm with which many architects took up the crusade against the prevailing defects: the old pan-closets, the foul D traps, the unventilated soil pipes, the dipstones, and the bell-traps, all of which have now become ancient history, with which the young architect seldom has to deal with nowadays. Among these reformers was my old friend Mr. Philip Webb, but the architect who was most distinguished for his direct and original contributions to the solution of the many unsettled practical problems of that time was the Nestor of your profession, Mr. Norman Shaw. What he made use of in his own practice was an arrangement that not only provided for a double disconnection of the soil pipe from the house-drain, but did away with the use of a trap underneath the closets and sinks as well. This he accomplished by means of a hopper head into which the soil and sink pipes discharged at their upper extremities, with a corresponding disconnection on the ground level arranged with a gully-trap. In this manner he avoided the use of any closet or sink traps inside the house, to which I believe he had a strong objection, and he at the same time advocated the adoption of soil pipes of a small diameter to avoid any accumulations upon their internal surfaces. It happens that a case came to my notice only last year in which these arrangements were condemned by a local authority as being inconsistent with their by-laws, and, in consequence, they were entirely removed, and ventilated soil-pipes with traps ordered to be put in their place. I mention this because it was found that the system had worked exceedingly well for, I suppose, about twenty years; and it was discovered on the removal of the soil pipes, which were only 3ins. in diameter, that their internal surfaces were as clean as the day upon which they had been fixed. It is probable that if this system had been in universal use the proposal to do away with the disconnecting-trap between the house-drain and the sewer would never have been made.

The Bacterial System.

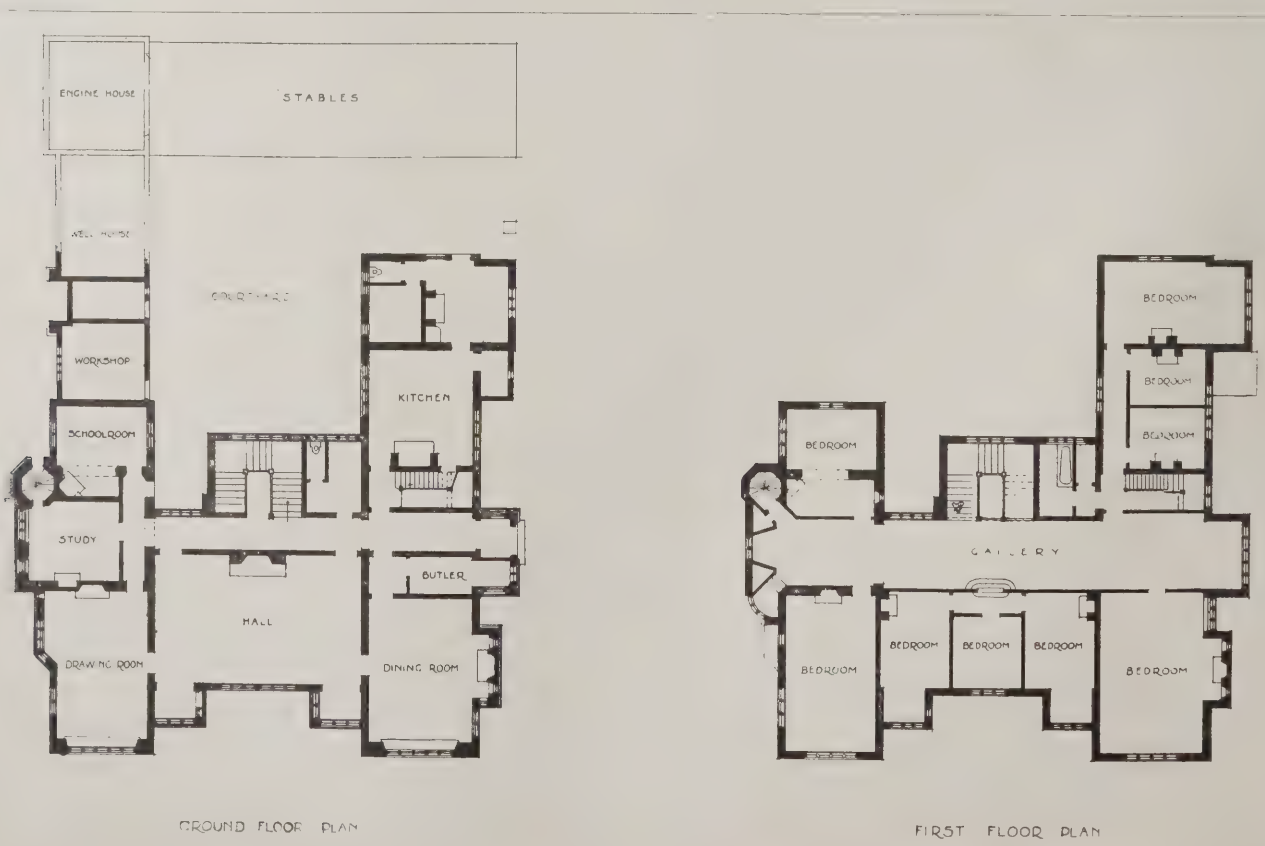
Coming now to the subject of sewage disposal, although my remarks should be confined to that part of it which most concerns the architect, namely, the drainage of country houses, it may be well to say something about the general principles which should apply when adopting what is known as the bacterial system of sewage disposal. It is needless to say that as a matter of fact the final purification of all foul matters has been due to the work of micro-organisms from the beginning of life on our planet, and that their work has been to restore organic wastes to their inorganic elements so as again to allow of their being used for building up the life processes of plants and animals through successive generations.

There are two terms, aerobic and anaerobic, which are in constant use, for which we are indebted to the illuminating genius of Pasteur. They represent the dividing-line between two kinds of micro-organisms, viz., those that can and those that cannot live without air; but it is a line that is frequently crossed. Without going into details, it is sufficient to observe that whether or not a particular organism can or cannot work in only one or in both of these conditions the difference between the results achieved by the two classes of bacteria is of the most remarkable kind.

The anaerobic changes come under the general term of putrefaction, and the aerobic of oxidation, but they each break down organic substances into simpler molecular forms. About the great difference that exists between the two processes there cannot be any doubt, seeing that one produces gases that can be used as illuminants, and the other, the aerobic group, those that will put out the light of a candle. The work of the two kinds of organisms, from a practical standpoint, must be judged from the effect they have in carrying on the required changes to the necessary standard of purification in any particular case, and the whole object of the process is to take the greatest possible advantage of their natural functions. Unfortunately the subject has hitherto been approached from an altogether unscientific standpoint, seeing that it has never been subjected to any method of measurement. The result has been, what must always be expected from rule of thumb, that no real progress in a scientific sense has been achieved at all, and though a Royal Commission has been sitting for more than ten years and spending large sums of money upon the collection of a vast accumulation of facts and figures, these can be of little value until they can be correlated in terms of a common standard of comparison, in comprehensible terms. In such a case an architect who is only concerned with practical results, but who is anxious to obtain some reasonable and definite knowledge such as he can obtain in other branches of his profession from text-books that deal with accurate and scientific data, may well be forgiven if he is quite fogged when a client appeals to him for advice on the subject of sewage treatment by bacterial processes, and I am afraid that if he applied to the Royal Commission on Sewage Disposal for specific advice they could only refer him to reports and minutes of evidence and appendices that would make confusion worse confounded and be altogether beyond his comprehension.

One point is fairly obvious, that an architect has to deal with the problem in one of its simplest forms because, while there are many disturbing factors in the case of town sewage by reason of trade wastes and other complications, he has to deal with it in a fairly normal and uniform condition. It follows that if any real progress had been made in the direction of a standard method of disposal the architect should have been the first to be able to take advantage of it.

Turning your attention for a few minutes to what actually does occur when micro-organisms convert organic matters into their inorganic elements, it may be well to refer you to the highest results that have ever been obtained in the purification of purely domestic sewage by bacterial processes. It happens that the information is given in a much more detailed form than in any other experiments, because the changes are shown as they actually occur during the process of filtration. They are known as the Ashtead experiments, and are clearly set forth in the table. Without going into technical details it will be sufficient to point out that the great object is to convert the polluting nitrogenous substances into the mineralised form of nitrogen as nitric acid, in which they were originally assimilated by the life processes of the plant or animal. This is done by the conversion of the ammonia, and as the one of these is decreased there is a corresponding increase in the other. This may be regarded as the whole *rationale* of the process. The results were obtained by first subjecting the sewage to the action of the anaerobic or putrefactive fermentation carried on by organisms that do not require air, but assimilate the chemically combined oxygen in the organic matter itself. It was long a question as to how long this putrefaction should be allowed to continue, but as the result of experiments which I carried out for a Committee of the Surrey County Council quite recently it was shown that with a well-arranged filter a wide range in the period of the putrefactive fermentation



GROUND FLOOR PLAN

FIRST FLOOR PLAN

MANCROFT TOWERS, OULTON, SUFFOLK. G. J. AND F. W. SKIPPER, ARCHITECTS. (*See centre plate.*)

was permissible without seriously affecting the results.

A Recent Example.

The most recent installation that has been carried out on these lines has been for Messrs. Forsyth and Maule at a large country house in Berkshire. Here the sewage is first delivered into a chamber in which a deep dip-stone is fixed. The effect of this is to force the incoming sewage in a downward direction so as to allow the heavy inorganic matters to fall to the bottom, provision being made for its removal as occasion demands. The sewage overflows from the forward end of this chamber into the same kind of apparatus which I used in my Ashtead experiments, and to which I gave the name of a "cultivation-tank." The object of this arrangement is to allow the sewage to impinge upon the surfaces of stones, with which the tank is filled, and which provide a permanent nidus or resting-place for the anaerobic bacteria. Whether this is the best arrangement possible may be called in question, but at any rate it is the one which has given far higher results than any other as regards the final effluent it discharges from the filters. The sewage remains in the "cultivation-tank" for a period that depends upon the ratio between the rate of flow of the sewage and the cubic capacity of the tank, after deducting the displacement due to the flints or stones, and this must necessarily vary much longer during the night, and much less during the day, and so on. In order to meet the case of the house being empty or full, the tanks are arranged in a series of four. All irregularities are no doubt a disturbing factor, but from the recent experiments referred to a considerable range of variation makes no material change in the results. The effluent from the cultivation-tanks escapes at practically the same level as the intake, and is then carried in a pipe to a distributing apparatus, known as Phidian's, which is self-acting, and is revolved by the weight of the liquid itself, which falls evenly over the surface of the filter and discharges by its own gravity, first through 3ft. of graded filtering material, and then through another pipe and distributor over and through another filter which was provided to meet the case of having to discharge into a river celebrated for its trout. Although this arrangement is practically the same in most respects as the one which I used partly as regards the preliminary anaerobic tank in 1892, and wholly in the Ashtead experiments in 1897, I do not think it fails in any way to give effect to the most advanced ideas of the present day, but it has one great disadvantage and that is its cost. Although I have devoted nearly twenty years to its development and have contributed a full share of my time in attempting to put the whole subject on a more scientific and satisfactory footing, I cannot but think that in the case of country houses, at any rate, there must be some more simple and inexpensive means of arriving at equally satisfactory results. I must also admit that, although the apparatus I have described was based upon the results of long experience, it, too, has been carried out to some extent by rule of thumb, and it is a question with me as to whether it would not have been better to get the actual facts beforehand with regard to this particular sewage. The difficulty is that doing so would have entailed the employment of a chemist and the use of a testing-apparatus beforehand, which in the case of small installations would be regarded as too expensive, though in nine cases out of ten it would be far the cheapest procedure in the long run.

In towns, where millions of pounds of the ratepayers' money have been absolutely wasted upon schemes that have been approved by the Local Government, but have proved futile, it is a different matter, because in such schemes the cost of arriving at definite information and safe conclusions beforehand would be trifling, whereas in the case of an ordinary country house it may be prohibitive.

Nuisance from Smell.

One thing I ought to refer to is the question of nuisance arising from smell in small bacterial installations, and the other is that of the attention required to keep them in proper working order.

I have found that in cultivation-tanks and similar arrangements there is a period in their maturing that generally occurs about a fortnight from the sewage being first applied, when very offensive odours may be expected, but that this passes off in a few days, and afterwards smells only occur during certain changes in the weather that are not frequent, such as when it is thundery or during a very low barometric pressure. This, of course, is not pleasant, but in the light of recent knowledge there is no reason to suppose that these odours have any really bad effect on health. Of course, this may not hold good in the case of nervous people who make up their minds that an illness and a smell are in the nature of cause and effect, because they noticed a smell so many days before the illness commenced, but the experience of those who have to deal constantly with sewage works, and who are an exceptionally healthy body, shows that these smells are not dangerous. The case of Birmingham may be quoted, where twenty millions of gallons of septic sewage are being actually sprayed into the atmosphere within a short distance of the town without a protest of any kind. This is, I think, carrying matters too far, and, even if my prediction that Birmingham will one day have a rude awakening by reason of an epidemic of some sort, in any case the system is most offensive.

When these cultivation-tanks receive a little intelligent attention they go on doing their work for years without trouble of any kind. One installation occurs to me which was put down by Mr. Philip Webb about fifteen years ago in the neighbourhood of East Grinstead, and has worked quite satisfactorily ever since.

Where a sufficient fall is available and an efficient system of bacterial filtration adopted there is no difficulty in disposing of the effluent by passing it into any stream that is not used for drinking. In the case of Staines it is allowed to pass into the Thames direct from the filters. When filtration is not available it requires a very porous soil to admit of the discharge being disposed of in underground open-jointed pipes. In such cases it is better to pass it through long shallow channels on the surface of the land, though this, of course, can only be done when the necessary land is available.

I still think that some more simple devices may be found for dealing with the drainage of country houses than those which I have described, and I hope it may fall to the lot of some of the younger members of the Architectural Association to discover them.

EDINBURGH BUILDING TRADES EXCHANGE.

The annual meeting of the Building Trades Exchange of the City and district of Edinburgh was held in the Exchange Rooms, 61, Lothian Road, Edinburgh, on November 4th, Mr. W. Graham-Yooll presiding. The report by the directors for the past year was submitted, along with the balance sheet and profit and loss account. In moving the adoption of the report, the chairman regretted the continued dulness in the building trade, which had had its effect on the Exchange, as several members had given up their membership. He regretted that more advantage was not taken of the Exchange premises, and urged builders and others connected with the building trade to give the Exchange all the support they possibly could, for its usefulness had been demonstrated over and over again in times of strikes and other labour troubles. The report was unanimously adopted. Messrs. John Howden, ironmonger; Robert Lamb, builder; and William Patterson, venetian blind-maker, were re-elected to the board of directors, and Mr. Adam Loch, asphalter, was also elected for the first time. Mr. A. Davidson Smith, C.A., was re-elected auditor.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Nov. 24.	GARDEN CITY PLAN, BURY, LANCS. In connection with the forthcoming exhibition of cottage designs in the Bury Art Gallery, the Bury Housing and Town-planning Association offer three prizes for a design for laying out a garden city suburb within the confines of the Borough of Bury. First prize £5; second prize £3; third prize £1 10s. Designs should be sent to Mr. H. Townend, Curator, Art Gallery, Bury, Lancashire.
Nov. 30.	HERNE BAY PAVILION ON PIER. Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: one guinea.
Nov. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addressed foolscap envelope and the payment of a deposit of one guinea. Deposit returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Dec. 1.	TRALEE. CARNEGIE LIBRARY AND TECHNICAL SCHOOL. Cost not to exceed £4,500. Premiums of £20 and £10 for design placed first and second by the assessor. Copies of instructions and conditions from the Town Clerk, Tralee.
Dec. 1.	PUBLIC PARK PLAN, BANGOR (COUNTY DOWN). The U D. Council offer a premium of £30 for the best scheme for laying out a public park, twenty acres in extent. Premium to include all expenses of successful competitor, whose designs become the property of the Council. Schemes to J. Middleton, Town Clerk, Town Hall, Bangor, County Down.
Dec. 11.	MINEHEAD. SHELTER, with cloakroom and lavatories, on the Beach, the whole expense of which is not to exceed £3,000. Premium of £20. Plan of site and conditions from L. C. Webber-Incledon Clerk to U.D. Council, 16, Park Street, Minehead, Somerset.
Dec. 18	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
1910. Jan. 31	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.

(Continued on next page.)

(List of Competitions Open.—Continued.)

Feb. 1.	**OLDHAM, EXTENSION OF THE TOWN HALL.** Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.

Isolation Hospital, Aberdare.

Sir William Emerson, F.R.I.B.A., and Dr. W. Williams, County M.O.H., the assessors in the above competition, have delivered their award as follows:

1st premium to Mr. Edward C. H. Maidman, 13, South Charlotte Street, Edinburgh.

2nd premium to Messrs. Stockdale, Harrison and Sons and Howard H. Thomson, F.R.I.B.A., joint architects.

3rd premium to Mr. E. Montague Thomas, 37, Old Queen Street, Queen Anne's Gate, Westminster, S.W.

Eltham Parish Hall.

In the above open competition the assessor, Mr. T. Lempriere Hesketh, F.R.I.B.A., selected the joint design submitted by Messrs. Moscrop-Young and Glanfield and Percy J. Waldram, F.S.I., of Buckingham Street, Charing Cross, W.C., who have been appointed architects for the work by the Building Committee. Sixty-three designs were sent in.

Our Plate.

The Red House, Cromer.

The Cromer residence of Sir Francis Layland-Barratt, Bart., M.P., has been built for him in accordance with the plans of Messrs. George J. Skipper, F.R.I.B.A., and F. W. Skipper, of Norwich, by Mr. George Riches, builder, of Cromer, on a site comprising several acres of land, having interesting views across the sea, lighthouse, cliffs, and golf links. The plans sufficiently explain the nature of the accommodation. The exterior has been carried out almost entirely in brickwork, stone only being sparingly used. The roofs are covered with Bedfordshire red tiles.

Mancroft Towers, Oulton Broad,

Mancroft Towers, the residence of Col. Philip E. Back, stands in a commanding position on an eminence overlooking the Waveney Valley, whence views many miles in extent can be obtained across the surrounding country. The building has been designed according to instructions in a simple and plain manner, after the style of old Tudor brickwork, of which there are many good examples in the Eastern Counties. No stone has been used for decorative purposes, the mullioned windows and all other features having been carried out entirely in brick. The interior has some interesting features, of which the hall on the ground floor carried up higher than the rest of the ground floor rooms, and the long gallery on the first floor extending the entire length of the building, are leading examples. An electric plant has been put down for the purpose of supplying the building with water, and the whole of the establishment with electric light. A suitable lodge adjoins the entrance gate. Messrs. J. Youngs and Son, of Norwich, were the general contractors, and the architects Messrs. George J. Skipper, F.R.I.B.A., and F. W. Skipper, Norwich.

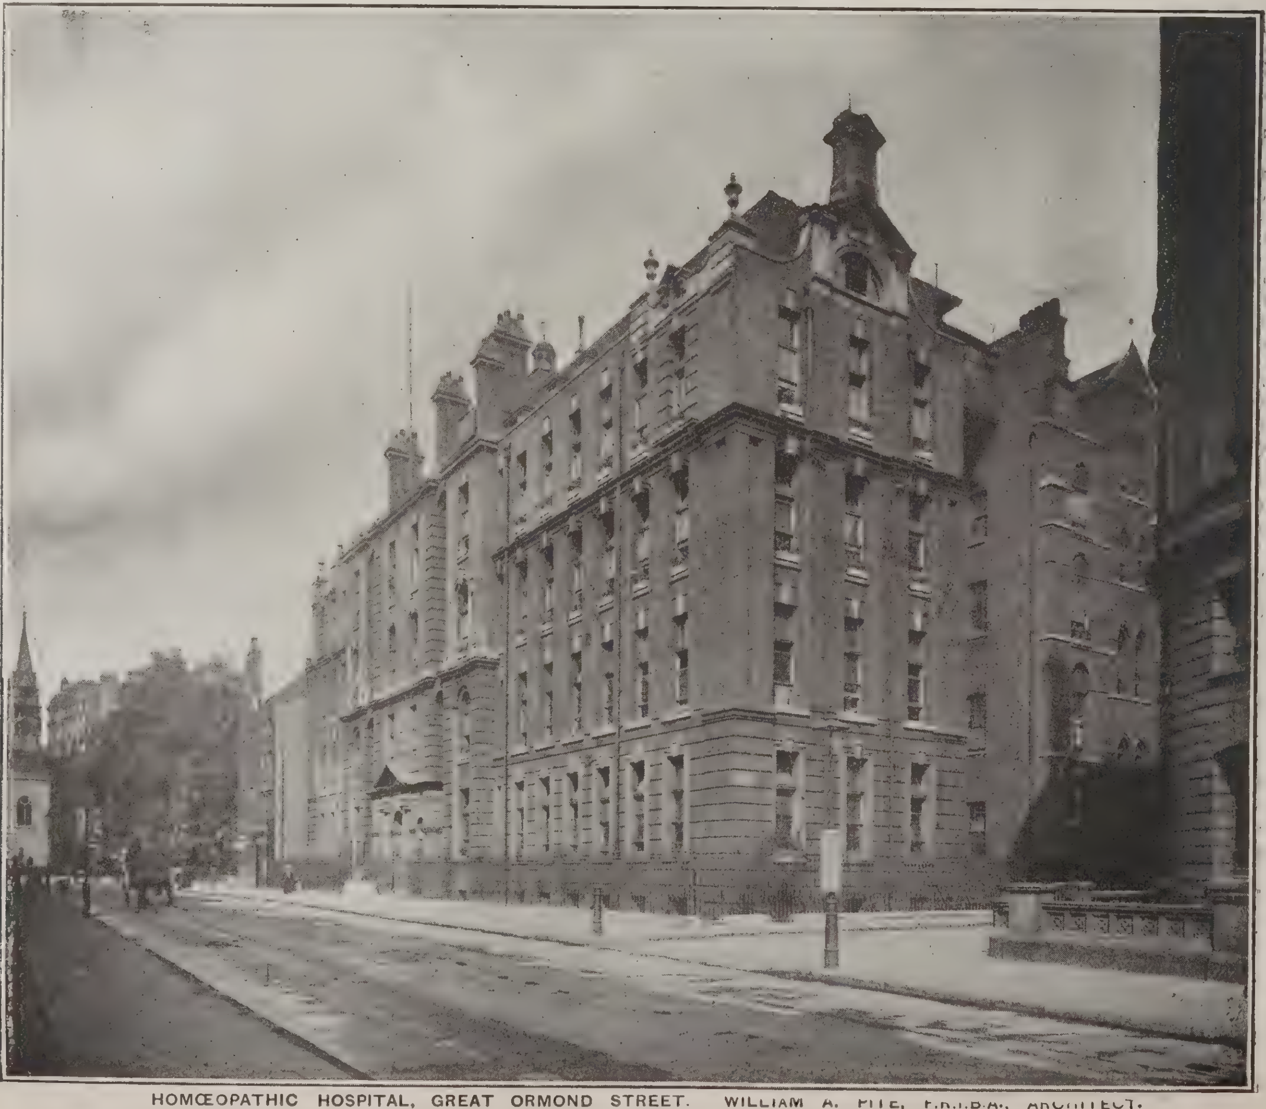
15, Carteret Street, Westminster, S.W.

These premises were designed for the North British Plumbing Company, Ltd., and were built by Messrs. Trollope and Colls in 1906. The ground plan is schemed with an office and goods entrance. The latter leads down a sloping way to a large store for materials. The whole of the front first floor is occupied by a board room, which is separated from the engine and machine shops by a corridor. This effectually keeps the board room quiet. The front is built of Crowboro' stocks, and Lawrence's red seconds. The stonework is Doulting. The following is a list of the subcontractors: Drainage, The North British Plumbing Company, Ltd.; wrought ironwork, Messrs. Starkie Gardiner; casements, Messrs. R. and E. Pearce; door furniture, Messrs. N. F. Ramsay and Brother. The total cost was £2,000.

LONDON'S PROPOSED NEW BRIDGE.

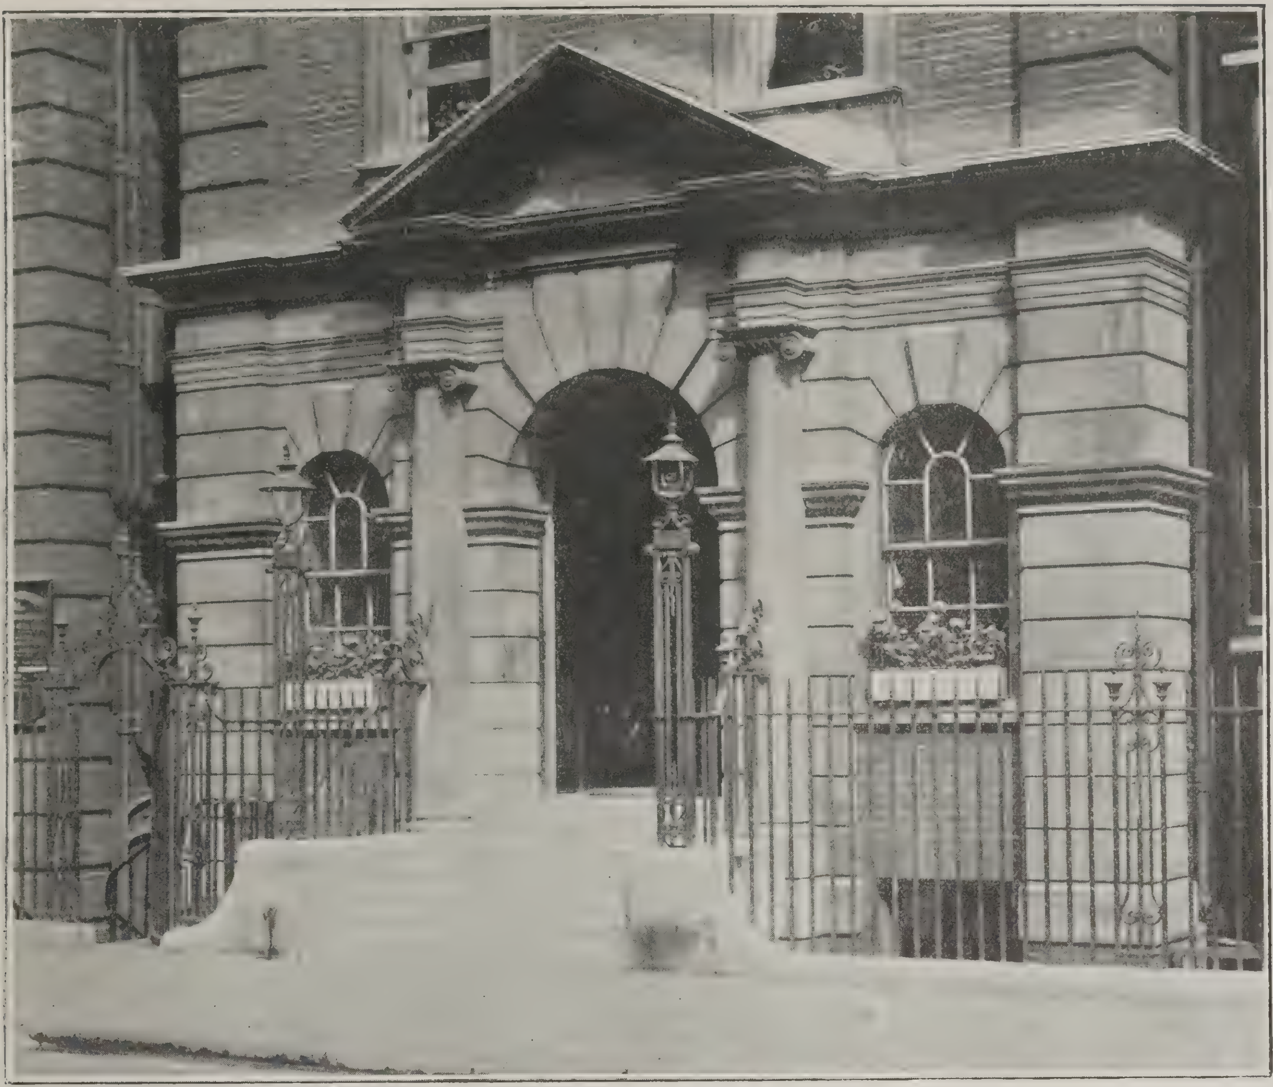
The Bridge House Estates Committee of the City of London Corporation have submitted to that body an important report relating to bridge accommodation in the City.

In July last the Committee recommended that a new bridge should be constructed at an estimated cost of £1,646,983, and that the gradients of Southwark Bridge should be improved at an estimated cost of £231,000. The Committee were instructed to reconsider the matter and to submit a further report. This they have now done. The chief objections to their scheme were that it was not proposed to widen Southwark Bridge; that the proper way of dealing with north and south traffic was by subway or tunnel under the river; that the east and west thoroughfares needed



HOMŒOPATHIC HOSPITAL, GREAT ORMOND STREET. WILLIAM A. PITE, F.R.I.B.A., ARCHITECT.

The Homœopathic Hospital was rebuilt in 1894, taking the place of several old houses which had been adapted for the purpose.



DETAIL OF ENTRANCE DOORWAY, HOMŒOPATHIC HOSPITAL, GREAT ORMOND STREET, WILLIAM A. PITE, F.R.I.B.A., ARCHITECT.

The building shown by the general view on page 360, of which the above is a detail, was designed by Mr. Pite, who also extended the Nurses' Institute at a cost of about £33,000. The building is now being extended to Queen Square, the architect being Mr. Edwin T. Hall.

widening; that the suggested new bridge was not wanted; and the destruction of rateable value. These criticisms the Committee answer in some detail. They say that it would require two tunnels of 30ft. diameter and one of 25ft. to give approximately the same accommodation as that provided by a bridge, whereas the cost of construction would be £2,298,000, and the cost for land £2,224,500, making a total of £4,522,050. The revenues of the Bridge House Estates are not applicable to the widening of east and west thoroughfares or the making of new routes.

As to whether the new bridge is wanted, the Committee quote the opinion of the Royal Commission on London traffic that if it be practicable to pierce new arterial streets and widen existing streets every kind of locomotion will be facilitated. The Commission advocated the construction of two main avenues through London—one from east to west and the other from north to south. Such a proposal obviously involved the erection of a new bridge. The Bridge House Committee suggest the utilisation of the thoroughfare leading from the General Post Office to Islington and Holloway. They do not consider that the rateable value of the City would be seriously affected by the amount of property required for the new bridge. The rateable value of the City, notwithstanding the many street improvements, has increased from £4,839,816 in 1901, to £5,479,000 in the present year.

The Committee, in now re-presenting their report on the same lines, say that the suggested new bridge has been altered on the southern side. This alteration gives a straighter approach, but will result in a gradient of 1 in 40, as compared with their former plan of 1 in 45, and necessitates raising the level of Southwark Street. They consider that the schemes they suggest are the best means of dealing with the subject. All the evidence, they say, points to the urgent necessity for a new bridge if present and future needs are to be met, and they are strongly of opinion that the Corporation should undertake its construction in the public interest out of the Bridge House revenues. Having given the reference their serious and earnest consideration, they again recommend the construction of a new bridge at a cost of £1,646,083. They further suggest that Southwark Bridge should be reconstructed at a cost of £261,000. The report is signed by the chairman (Mr. Deputy Algar) and 24 members of the Committee, one of whom, however, is opposed to the expenditure on the reconstruction of Southwark Bridge. A member of the Corporation has given notice of an amendment to reject that portion of the scheme which provides for the erection of a new bridge.

Societies and Institutions.

Junior Institution of Engineers.

The annual general meeting of this institution was recently held at the Royal United Service Institution, Whitehall. The Council's annual report which was presented showed that the membership has increased to 1,063, 85 elections and transferences having taken place during the past year. Nine ordinary meetings had been held, and 29 visits to works made, covering practically every branch of engineering. The summer meeting in the Midlands had proved very successful. Birmingham had been made the centre on account of the Institution's first local section having been established there during the year. Other salient features in the report included reference to the Gustave Canet Lecture, delivered on the twenty-fifth anniversary of the Institution by Lieut. A. Trevor Dawson, R.N., on "Engineering of Ordnance"; awards for Papers; Durham Bursary; and the Monthly Journal and Record of Transactions, the volume for the year under review consisting of 758 pages, together with illustrative plates. The scrutineers reported that the election of officers, etc., had resulted as follows: Chairman, Mr. Geo. T. Bullock; vice-chairmen, Mr. J. Wylie Nisbet, Mr. F. D. G. Napier; hon. librarian, Mr. S. V. Cooke; hon. auditors, Messrs. H. Norman Gray and Henry Cook; members of Council, Messrs. G. D. Harrison, Jas. Oswald, C. H. Smith, and Percy L. Young; provincial members of Council, Messrs. C. T. Briggs (Newcastle-on-Tyne); Ernest King (Sheffield), R. H. Parsons (Peterborough), Eustace W. Porter (Southampton), T. P Hosegood (Bristol), Adam Hunter (Glasgow), W. E. Lilly (Dublin), H. F. Hunt (Pembroke). The annual meeting of the benevolent fund then took place, the statement of accounts showing that the amount standing to its credit is £188 19s. 9d. A paper was then read by Mr. T. A. Watson, Assoc.M.Inst.C.E. (member) on "The Reinforced Concrete Construction of the new General Post Office buildings, London." After giving a general description of the building, the author proceeded to deal with the various considerations affecting the design and construction of the walls, during which comparison was made to walls of similar strength constructed in brick. The retaining walls, floors, method of re-inforcing and columns were treated, dimensions and number of re-inforcing bars. Points in connection with jointing, stirrups and special features in the building were next touched upon, including floors, etc., on cantilevers, footbridge, chimney, tunnels under King Edward Street, and staircases. The methods of dealing with the difficulties which were met with during construction of the retaining walls, etc., were described, and the composition and mixing of the concrete used in the work were then entered into. The paper concluded with questions relating to testing of steel and experiments with tests columns. An animated discussion followed, in which Messrs. L. H. Rugg, Hy. Adams, H. M. Martin, P. J. Waldram, William Dunn, E. F. Etchells, R. Vawdrey, and B. E. Parry took part, and the proceedings terminated with the announcement of the ensuing meeting on the 16th November, when Engineer Vice-Admiral Henry J. Oram, C.B., would deliver his presidential address on "Recent Warship Machinery."

Institution of Municipal Engineers.

A meeting for the purpose of forming the District Committee for District No. 4 (comprising the counties of Cambridge, Huntingdon, Norfolk, Northants, and Suffolk) will be held at the Royal Hotel, Norwich, on Saturday, November 13th, at 2 o'clock.

Leeds School of Art.

In the first of a series of four lectures on the arts in England at the close of the seventeenth century, delivered at the Leeds School of Art, Mr. Butler Wilson dealt with the Anglo-Classic or Seventeenth Century style of architecture. The lecturer said he had selected the subject on which he proposed to address them because it was to the work of that period we were so largely indebted for the tradition which was being developed by many of the examples of the architecture and applied arts of to-day. He proceeded to trace the influence of Inigo Jones, describing some of his works, including the Banqueting House in Whitehall, and Greenwich Hospital. He also reviewed the work of Sir Christopher Wren, showing on the screen St. Paul's Cathedral, Hampton Court Palace, and a house in West Street, Chichester. It was pointed out that although many buildings of this period were thought by some to be deliberate designs in the manner of the Italian Renaissance, the works of Inigo Jones and Wren were unmistakably English. Their work was the work of men who had absorbed all that they could learn from the art of another country, and who, by the force of their own characters, were able to make that art their own. Among the lantern slides exhibited was one showing a plan of the gigantic palace designed by Inigo Jones for James I., but which, with the exception of the Banqueting House in Whitehall (intended to form a small part of the palace), was never built.

Institution of Municipal Engineers.

At a meeting of the Council of the Institution of Municipal Engineers, held on October 27th, fourteen applications for membership and seven for studentship were considered. Of the former, twelve were accepted; of the latter, seven. The roll of the Institution is now: Members, 630; students, 89; total, 719. It was considered advisable that a class of associate members should be attached to the Institution, such associate members to be entitled to the privilege of corporate membership, and it was suggested that the following should be the clause in the by-laws in respect thereto: "Associate Members.—A candidate for election or transfer to the class of associate member must produce evidence to the satisfaction of the Council: (1) That he (a) has received a good general and scientific education, (b) has been regularly trained in those branches of engineering comprised within the duties of a municipal engineer, and (c) has had subsequent employment in the service of any municipal authority of which one year at least has been spent in an important position of responsibility in the direction or design of municipal work; or (2) (d) has had such experience in the design or execution of important engineering work for any municipal authority as to qualify him in the opinion of the Council for the distinction of associate membership." The opinions of members on the proposal, to be submitted before the next council meeting, to be held November 27th, are invited. It was suggested that "the Council shall at their first meeting after the annual election have power to appoint an honorary librarian from among the members of the institution, this official to be an ex officio member of the council until the next annual election." The opinions of members are invited on this proposal also. It was decided that arrangements be made for a general meeting—followed by a social evening, to which latter ladies would be invited—to be held in December. A committee with power to act was appointed to arrange the details. Members who are willing to submit papers for reading at this or a subsequent meeting are particularly requested to communicate at once with the Secretary. The Secretary was instructed to arrange for a visit to works for some day in November. It was decided that the joint meeting of the Council and the honorary secretaries of the various district committees should be held on November 27th, the day of the next Council meeting. A letter was read from Mr. Charles Vawser, of St. Mark's Lodge, Woodville Road, New Barnet, with reference to a proposed municipal golf tournament. Members requiring particulars are requested to write to him. A letter was read from the honorary secretary of the Municipal Engineers' Imperial Defence Committee, asking for the support of the Institution in the proposed scheme for the formation of a municipal engineering corps. The Council, while expressing their accordance with the general principles involved, resolved to defer consideration of the letter until their next meeting.—B. WYAND, Secretary, 39, Victoria Street, S.W.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

At the second meeting of the session of this Society, held in the College Buildings on 22nd Oct., Mr. T. L. Watson, F.R.I.B.A., I.A., delivered a lecture entitled "The Autobiography of a Cathedral," taking as his subject the interesting Glasgow fabric. In the course of his lecture Mr. Watson remarked that there is no building the life history of which is more fully recorded in its architecture, and few which have an autobiography of such interest. The lecturer dwelt at considerable length on the beautiful lower vault, and pointed out its value as an archæological document. The examination of the vaulting resulted in the discovery of a succession of architectural periods showing in brief that the cathedral was begun by Bishop Walter in the south-western compartment of the lower church. The work was continued by Bondington, and about 1240 the vaulting of the north and south aisles was completed, the middle compartment, however, and the eastern aisle, being left unvaulted and open to the heavens. Hereafter the other parts of the building were completed, still leaving the middle compartment, and the obvious explanation of this was that the whole material of the choir triforium and clerestory walls had to be brought into the middle compartment on the level of the soil, and hoisted thence to its position on the walls. The lecture was illustrated by several drawings. At the close Mr. Watson was cordially thanked for his lecture.

Scottish Building Trades Federation.

For some considerable time, the Inverness Building Trades Federation had been endeavouring to get the local conditions of contract recognised by architects. Some time ago the local builders and architects agreed to certain general conditions of contract, but one firm of architects objected. During the past week or two, the position of matters has become accentuated. The Highland Railway Co. are about to erect an hotel at Strathpeffer. A deputation of the local Federation waited upon the chairman of the Highland Railway Co., and explained their position to him. He reported to a meeting of the railway company's directors, who, however, decided that they cannot interfere with the architects. Consequently, the Federated Inverness contractors decided not to tender for the work of the Strathpeffer Hotel; and the position has been fully reported to the other branches of the Scottish Building Trades Federation.

SHEFFIELD SEWAGE WORKS.

The first section of the extended and reconstructed sewage works of the Sheffield Corporation at Wincobank, about three miles from the centre of the city, was opened on October 28 by the Lord Mayor. The scheme thus inaugurated marks the first stage in the work of substituting the bacteriological process of sewage purification for that of lime precipitation, followed by aeration over weirs and continuous filtration through coke. Experiments in the bacteriological treatment have been made by the corporation for ten years past, and it was ultimately decided to adopt a scheme for purification by this process, consisting of continuous-flow settling tanks and contact beds. The work, which includes the remodelling of the present system, comprises the following:—New outfall sewer and main valve chamber, two new catch-pits and alterations to the two existing catch-pits, nine new settling tanks, and conversion of the existing tank area into eight additional tanks, deepening the two existing sludge wells and remodelling the pumping plant, 60 half-acre contact beds, 16 acres of storm beds, bridge and siphons across the river Don, roads, railways, etc. The estimated cost of the work is £270,369, exclusive of land and second contact beds. The gross area of the land which will ultimately be available is 204 acres, and the approximate cost £86,000. The works will be capable of dealing with a maximum rate of flow of 64½ million gallons in 24 hours, this quantity being determined chiefly by the fact that the Local Government Board require provision for treating in periods of storm about six times the dry-weather flow. The scheme is based on a dry-weather flow, including trade wastes, of 12 million gallons a day. The filling material of the contact beds is screened clinker, graded from coarse to medium, and fine on the top, and the average depth is 4ft., the floors being graded to the outlets. After leaving the settling tanks, the sewage will pass along the main conduit and branches to a feed culvert communicating with a circular distributing chamber in the centre of each bed, whence it will be distributed over the surface by means of channels formed in the surface of the filling. The works now opened consist of the altered catch-pits and sludge wells, six new settling tanks, and 12 contact beds, and will treat a maximum flow of six million gallons a day. This quantity will be rapidly increased to 12 million as 12 other contact beds, the construction of which is completed, are filled with clinker. The scheme has been designed by and carried out under the supervision of Mr. C. F. Wike, the city engineer of Sheffield, and the cost of the work so far carried out has been about £100,000. The contractors are Messrs. Logan and Hemingway.

Obituary.

Mr. H. Hall, F.R.I.B.A.

Mr. Henry Hall, F.R.I.B.A., who has died at 20, Quernmore Road, Stroud Green, and was formerly of 19, Doughty Street, W.C., had designed many private buildings in Somerset and Dorset. He was one of the nine competitors selected for the final competition for the new Government offices at Whitehall. He restored Nelson's house after its destruction by fire, and built many banks (including the head office at Salisbury) for the Wilts and Dorset Banking Co.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

Testing Completed Reinforced Concrete Buildings. Regarding the methods of testing completed structures of reinforced concrete, in order to get them passed by the authorities, or to prove that they are thoroughly sound and satisfactory, there are various methods that have been suggested and rules advocated for observance. Perhaps the most sound method is that provided for by the Prussian Government Regulations which were issued on May 24th, 1907. The translation of these is as follows:—"Compression cubes to be provided, 30 cm. (12 inches) side, to be dated and sealed. Tests made by the authority in approved manner. Tests may be made on the works by means of an officially controlled press. Portions of building in positions determined by building authority are to be exposed if desired, so that the mode of construction can be seen. Special tests may be made to determine hardness and strength. Should doubt exist as to hardness and correct mixing, test pieces may be cut out of the finished building. If loading tests are considered necessary, they are to be carried out under the instructions of the building authority. Loading tests are not to be made in less than 45 days after setting, and are to be strictly limited to what is considered necessary by the authority. When a floor is tested, the load added is not to exceed one-half the weight of the floor and one-and-a-half times the evenly distributed working load. When the working load is more than 1,000 kg. per sq. m. (205lbs. per sq. ft.), this may be diminished down to once the working load.

When a strip in a floor or decking is to be tested, the load is to be evenly distributed in the midst of the floor, over a strip of length equal to the span and width one-third of the span, but in any case not less than 1m. (39 inches). In this case the test load must not exceed the weight of the strip and twice the working load. The weight of floors is to be reckoned as defined below. In testing columns or piers, unequal loading of the building, and loading of the foundations beyond the permissible limit, are to be avoided."

To the foregoing we may add the French, Austrian and Swiss Rules:—

French Government Rules, Oct. 20, 1906:—

"Conditions of test and time that shall elapse before structures are brought into use must be inserted in contract, and also the maximum deflections as far as practicable.

The time to elapse before use of structures must be 90 days for structures of primary importance, 45 days for ordinary constructions and 30 days for floors.

Measurements to be taken during tests which are likely to be of scientific interest to engineers.

Test loads on floors shall be the dead and super-imposed loads acting over the whole area of the floor, or at least upon a complete panel.

The loads to be left on for at least 24 hours, and deflection to cease after 15 hours."

Austrian Government Regulations, Nov. 15, 1907:—

"Breaking tests of whole or part to be made on request.

No test before expiration of 6 weeks after completion of ramming.

Loading to be such that effect is same as dead load plus 1½ specified superimposed load. No cracks or permanent deformations.

For breaking tests, load to be gradually increased.

Breaking load not to be less than 3½ times the total dead and superimposed load, less the weight of the member."

Swiss Engineering and Architectural Society, Provisional Specification, August, 1903:—

"Test loads to be at least 50 per cent. greater than working loads allowed in calculations.

Test loads not to be put on until 45 days have been allowed for setting.

If possible, deflections at different stages of loading to be noted."

Bending Moments. There is considerable difference of opinion regarding the manner in which bending moments should be taken, and we have collected together the more or less official rules put forward by the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects, who issued their report in May, 1907, together with the French, German, Austrian, and Swiss regulations in the same respect. From these it will be gathered that while the British Committee thinks that for continuous spans the bending moment $\frac{W.L.}{12}$ is sufficient, on the Continent, as a rule $\frac{W.L.}{10}$ is adopted. The Austrian method, however, seems to be the most correct theoretically, and in any official rules that are drawn up latitude ought to be allowed to determine each case on its merits. There should be no hard and fast rules as regards bending moments, for it depends upon how a structure is reinforced and the nature of the loading, both superimposed and dead loads, as to the bending moment which ought to be taken. By designing a structure for the most unfavourable condition of loading, stability is insured. That is the Austrian method, and we think it would be hard to improve upon, except that we have our doubts about the advisability of limiting the continuity to three spans. If special attention is given to making more than three spans act continuously we see no reason why the designer should not be given the opportunity of doing so.

The Rules of British Reinforced Concrete Committee, issued in May, 1907, are as follows:—

"Spans. These may be taken as follows: For beams the distance from centre to centre of bearings. For slabs supported at the ends, the clear span plus the thickness of slab. For slabs continuous over more than one span the distance from centre to centre of beams.

Bending Moments. In the most ordinary case of a uniformly distributed load of—W—lbs. per inch run of span the bending moments will be as follows:—

(a) Beam or slab simply supported at the ends. Greatest bending moment at centre of span of 1in. is equal to $\frac{wl^2}{8}$ in. lbs.

(b) Beam continuous over several spans, or encastré or fixed in direction at each end. The greatest bending moments are at the ends of the span, and the beam should be reinforced at its upper side near the ends. If continuity can be perfectly relied on, the bending moment at the centre of the span is $\frac{wl^2}{24}$, and that over the supports $\frac{wl^2}{12}$. If the continuity is in any way imperfect, the bending moment at the centre will in general be greater, and that at the supports less, but the case is a very indefinite one. It appears desirable that generally in building construction the centre bending moment should not be taken less than $\frac{wl^2}{12}$. The bending moment at the ends depends greatly on the fixedness of the ends in level and direction. When continuity and fixing of the ends, whether perfect or imperfect, is allowed for in determining the bending moment near the middle of the span, the beam or slab must be designed and reinforced to resist the corresponding bending moments at the ends. When the load is not uniformly distributed the bending moments must be calculated on the ordinary statical principles."

The French Government Rules, issued on October 20, 1906, are as follows:—

"For freely supported or continuous beams usual values may be applied.

For partially fixed ends, the bending moment at centre of span for uniformly distributed load to be $\frac{wl^2}{10}$

If L and B are the spans of a rectangular slab, the bending moment as for a beam of span B can be decreased by co-efficient $\frac{1}{1+2\frac{B^4}{L^4}}$, or for span L the bending moment as for beam of span L with the co-efficient or [illegible] reduction of $\frac{1}{1+2\frac{L^4}{B^4}}$ moment as for beam of span L with the co-efficient of reduction of

The Prussian Government Regulations, issued on May 24, 1907, are as follows:—

"Span for beams to be free opening plus one support.

Span of continuous decking to be distance from centre to centre of supports.

For freely supported decking, the free span plus the thickness of the decking.

Bending moments and reactions to be determined by formulæ for freely supported or continuous beams according to mode of support and distribution of load.

For continuous decking, the bending moment at centre of span is to be taken as four-fifths of that which would exist in a freely-supported panel, unless the moments and reactions can be ascertained.

The above rule holds good for beams, excepting that no end moment is to be taken into account unless special arrangements have been made to fix the ends.

Decking and beams only to be reckoned as continuous if resting on solid supports in one plane, or on reinforced concrete beams.

Continuity not to be assumed over more than three spans."

The Austrian Government Regulations, issued in Nov., 1907, are as follows:—

"Spans for freely supported and continuous beams to be from centre to centre of support.

Beams extending over several supports must be computed as for continuous beams, incidental unfavourable loading being taken into account. Continuity not to be assumed as extending over more than three spans.

Elastic deformation in supports of continuous beams to be taken into account.

In beams the possibility of fixing moments at the supports must be provided for by suitable reinforcements.

If L and B are spans of rectangular slab, and L is not more than one and a-half B, slab being reinforced with equal area of metal both ways bending moment as for beam of span B can be decreased by co-efficient $\frac{L^4}{L^4 + B^4}$."

The Swiss Engineering and Architectural Society's Provisional Specification, issued in August, 1903, provides the following ruling:—

"Most unfavourable disposition of loading to be allowed for.

In continuous or encastré beams the bending moments at centre of spans not to be less than ⅔ the moments at the supports, due to the loading and amount of fixing, and reinforcement over supports is to be provided.

If amount of fixing cannot be determined, the moment at centre of span must not be less than 20 per cent. less than that for a freely supported beam, and that at supports to be at least half of that at centre."

Continuous Beams. In building a monolithic construction like reinforced concrete, it follows that the beams and floor slabs will have continuity of action, and this is usually allowed for in the design. But it is not an easy nor a definite matter to know to what extent we may rely upon continuity. The amount of that continuous action will vary. There are various factors which affect the problem and make its solution indeterminate, so that it must be a matter of judgment as to how much continuity we can depend upon. For instance, supports settle or deflect irregularly, adjoining spans differ in length, the moment of inertia of the section varies, and finally, one bay may be loaded while other bays are not. The loading on the floors varies in amount in different classes of structures, and this affects the continuity also, for it alters the ratios of the live to the dead load of the floor, and therefore the anchorage which, adjoining unloaded spans, provide to decrease the bending moment on the loaded span.

Rules and By-Laws. The Austrian Government rules, which we publish in the preceding page of the present issue, leave enquiriers to determine this continuous action by considering three spans with one loaded, and this regulation is a wise one, but in England the R.I.B.A. Committee thought $\frac{wl^2}{12}$ should be taken as the value of the bending moment of a continuous beam, and $\frac{wl^2}{24}$ as the bending moments over the supports, while in France and the United States $\frac{wl^2}{10}$ is a usual provision for the centre, and $\frac{wl^2}{40}$ over the supports. The R.I.B.A. rule, though better than the French and American bylaws, is, however, not satisfactory. If one bay is loaded and the others not, $\frac{wl^2}{12}$ may approximate nearly to average conditions in practice, but in that case there is usually a negative bending moment over the whole length of the adjoining beams, and no provision is made for it in the rules referred to. Double reinforcement is not customary, but we see that in such a case it may be desirable to prevent the adjoining beams cracking along the top, when the bending moment on the loaded span would be increased. Again, it is all very well to assume that $\frac{wl^2}{24}$ over supports may be good enough for the case of one span loaded, but if all spans are loaded, then if the beam is brought to allow for continuity $\frac{wl^2}{12}$ will probably be the bending moment developed over the support, in which case there will be insufficient steel, and cracks may be caused. This is indeed the case, and we have seen numerous examples calculated in the R.I.B.A. rules thus cracked over supports, while we learn that that is the usual experience in America.

Connections with Columns. But another factor may enter into the problem and affect our determination of the bending moment, viz., connections with columns. In many cases heavily loaded columns stand directly over the supports of beams, and then there is considerably greater fixity of the ends, when, of course, the bending moments on the beams can be more accurately taken as $\frac{wl^2}{24}$ as the centre. Really the proper course to pursue is to take the most adverse condition that may arise in each particular example, and make the parts sufficiently strong everywhere to resist the worst case.

The Factor of Safety. The fact that we put in too much steel and concrete to allow factor of safety means that a girder will act contrary to what it may be designed to do. We may assume that it will act as truly continuous as long as possible, in which case, if we have proportioned the parts, so that we provide less in one place than the most adverse conditions would require, then we shall stress our materials unduly high. Thus, for instance, if we provide for $\frac{wl^2}{24}$ over supports, then when all spans are loaded we should have nearer $\frac{wl^2}{12}$ over supports, which means that our factor of safety would be reduced to half what was at first assumed. Therefore, in such a case, we ought to provide for $\frac{wl^2}{12}$ both at supports and centre, and use double reinforcement also, so as to take up negative bending moment in adjoining spans when one bay is loaded alone. If, however, we pay regard to the partial fixing of ends of beams by columns, we should be still more justified in using this assumption. But if we must strike mean, let us adopt $\frac{wl^2}{16}$ at both centres and over supports.

CONTRACTION CRACKS DUE TO AN ABSORBENT AGGREGATE.

In an investigation of serious contraction cracks in *in situ* concrete, it has been shown that an absorbent stone as an aggregate can be readily responsible for this disfiguration. In this experience it was found that a concrete (6 parts of aggregate to one of cement) was being used for the construction of floors and walls of sewage tanks, and in this work the responsible engineer had specified as an aggregate the sandstone from a certain quarry adjoining the site of the work. This stone it was found on passing through the crusher and concrete mixer became sufficiently disintegrated to provide the requisite amount of sand, and consequently the addition of other sand was unnecessary. The work of construction was commenced in the early part of the year, and except for interruptions caused by frost, the same proceeded satisfactorily, but towards the end of spring large contraction cracks appeared in the concrete, and indeed many of these cracks appeared within one or two days of its being put into position, and as it was thought impossible to avoid these cracks with the cement that was regularly in use, the work was stopped pending an investigation. On inspection it was found that the contraction of the concrete had resulted from the dry absorbent nature of the sandstone used as aggregate. Practically no rain had fallen for three weeks during the period of construction, and an east wind had been generally prevalent, causing the stone to be very dry before being put into use. The larger lumps of aggregate (up to 1½ins.) did not become saturated with water during the mixing of the concrete, and consequently absorbed a quantity of water from the concrete whilst the latter was in process of setting. Thus in addition to the contraction which occurred as a result of this absorption, the concrete also failed to harden satisfactorily, owing to the lack of water necessary for crystallisation. The contractor then reluctantly applied the obvious remedy of soaking the stone for 24 hours before use, and after some extended experience of the use of the aggregate under this new condition, it was reported that the trouble of the contraction cracks had been well overcome.

REINFORCED CONCRETE SYSTEMS.

The Leslie System.

One of the more recent systems of reinforced concrete construction that have come upon the market is that of Messrs. Leslie and Co., Limited, of Kensington Square, London, W. Messrs. Leslie may, however, be said to have really several systems, for they act as general contractors for reinforced concrete construction as well as building of ordinary construction, and execute work designed on several systems belonging to other proprietors, while they also work patented systems of their own, and carry out most of the earlier types of fireproof-floor construction, the patents of which have now run out, or which are invalid. Their view is that none of the special methods, various combinations of which have been termed "systems," of reinforced concrete are applicable to all circumstances. They therefore prefer to have a free hand to meet each special case, and provide the maximum efficiency with economy which their judgment and experience lead them to suggest. Messrs. Leslie and Co.'s name is known better perhaps as general contractors for building work, and they have carried out many important buildings in London and elsewhere, as, for instance, the Royal College of Science, and the foundations of the Victoria and Albert Museum at Kensington (Sir Aston Webb, R.A., architect).

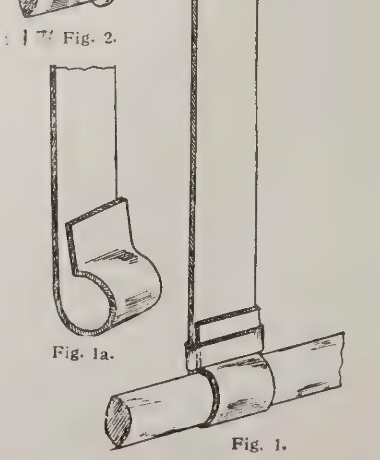
The claims that Messrs. Leslie and Co. put forward for their system of working are as follows:—

(1) They take full responsibility for the work they design and execute, whereas, when work is designed by one firm and executed by another the responsibility is divided and no surety afforded.

(2) Their engineering staff is directly associated with the practical work, and the work of construction is entirely under its control. This means that the workmanship is of the best, and that schemes are designed with an idea of economy in the erection, a matter that is of great importance in reinforced concrete design.

(3) Expenses in the way of establishment charges for a separate organisation are eliminated.

(4) There is a saving of time effected both in the preparation of designs and in submitting estimates, as also in the execution of the



Leslie's linked hangers, stirrups, and binders.

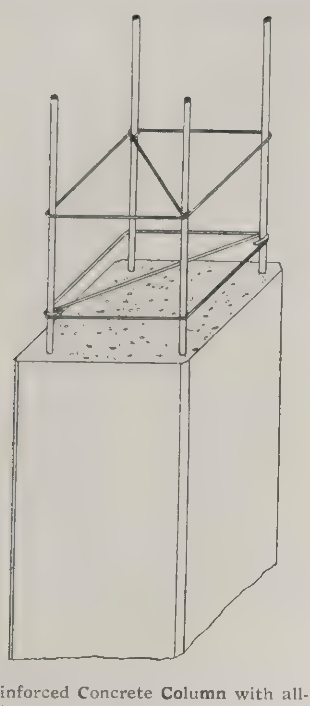


Fig 3.—Reinforced Concrete Column with all-round Wire Links, with Diagonals to reinforce Core.

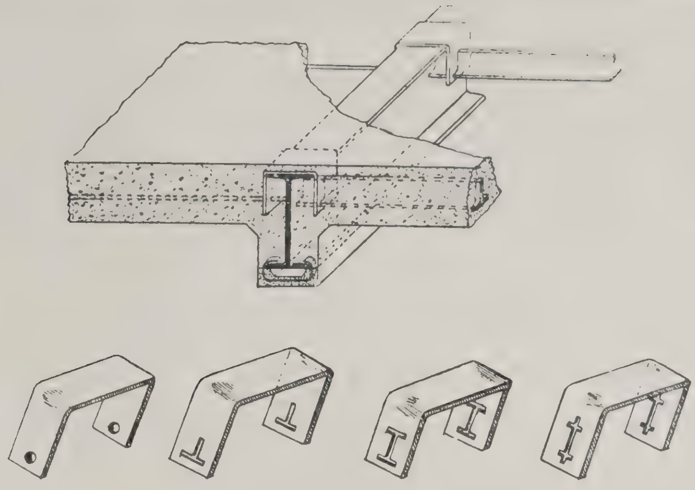

Fig. 5.—Hangers for suspending various Sections of Steel Members between Joists.

work, by the whole job being in the hands of one organisation.

(5) They are prepared to design work employing practically all the mechanical bond bars and sheet mesh reinforcements upon the market. In many cases they say that the ordinary commercial sections are all that is necessary, and these have the advantage that they can be purchased at a lower price than special reinforcements.

(6) The firm is not engaged in pushing one system nor one form of reinforcement to the exclusion of others, but endeavours to meet the wishes of clients in respect to any method of construction and suit themselves to different circumstances.

Contracting Methods.

There are two customary methods by which reinforced concrete is carried out in this country—one we may call the Continental, and the other the American method.

The former consists in a firm of specialist engineers, the proprietors of a system that has been patented at some time, who do not execute the work, but merely submit design and obtain tenders from licensed contractors.

The disadvantages entailed by such a system are, as hinted above, that the execution is divorced from the design, and such firms are not always able to give adequate guarantees for the safety and efficiency of the construction executed under such conditions. The designing firm is paid a royalty, and it is only the contractor who speculates. Very often he is inexperienced in such work, and has insufficient information upon which to estimate. If, then, he makes a mistake, is it to be wondered that he will try to recoup himself by executing the work with as little trouble and expense as possible? And, as he does not know what risks he is thereby taking, the work is scamped.

The second, or American method, consists in a firm who manufactures some special bar or meshwork reinforcement, and who in order to get its specialities supplied, undertakes the work of design. Usually contractors are got to estimate for the execution of the work, but these contractors are seldom licensed, and, of course, the risk of mistakes, scamping and bad workmanship, are, Messrs. Leslie argue, greater than with the "Continental" method. Firms employing the American method do not charge a royalty, but the price of their specialities is proportionately increased.

Messrs. Leslie and Co. admit that some of the special reinforcements are advantageous in certain circumstances, and they are prepared to use them when desired, but they prefer to design the work themselves, so as to use these forms of reinforcement to the best advantage, and so that they can guarantee the work. Also, when required, they will check designs prepared by the American method so as to take responsibility and guarantee the work.

Their method, in short, is to both design and construct the work, and to delegate no part to others, for that shirks responsibility.

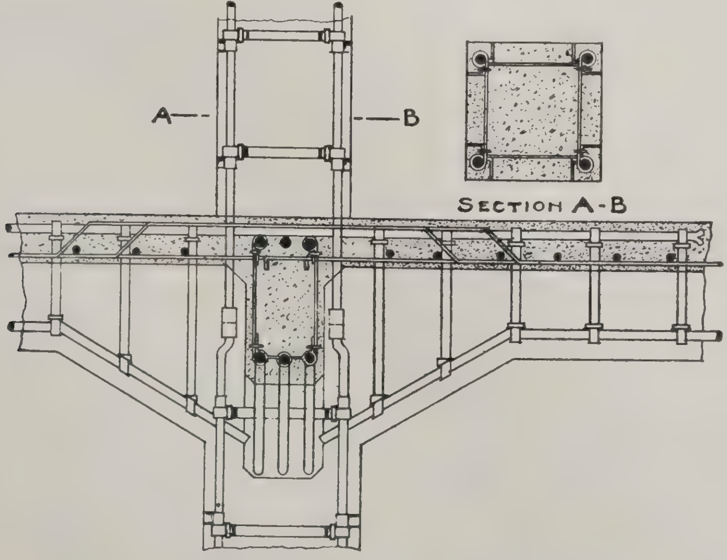

Fig. 4.—Leslie's Linked System of Reinforced Concrete.

So much for the general aspect. Now we can deal with Messrs. Leslie's own special systems for which they hold patents.

Leslie's Patent Shear Members.

A reinforced concrete beam is more or less a trellis girder in which the compression members are formed of concrete, and the tension members are provided by the steel web reinforcements, often termed shear members. It is a simple matter to understand that if we were to build a trellis girder it would be essential in order to develop its maximum resistance that the web members should be rigidly attached to the flanges; it would not do at all to have the ties sliding upon the lower flange. In reinforced concrete, however, we often use the shear or diagonal tension members just loosely hung round the bars without any provision for resisting the tendency to slide upon these latter. Where the shear stresses are great this sliding will take place, and the beam prematurely fail. A rigid attachment of such vertical members has therefore been generally adopted from a theoretical as well as a practical aspect, and special bars have been put upon the market which provide for this rigid attachment. Messrs. Leslie and Co., however, have invented a new form of hanger, stirrup or binder, which gives such rigid attachment to ordinary commercial sections like rounds or squares. This patent hanger is shown in Figs. 1 and 2, from which it will be seen to consist of strips of flat metal or wire looped to engage the bars, tightened upon the same by means of links that are driven over to the short ends of the stirrup, which are inclined inwards, so as to wedge up tightly and clamp the bar. It is important to notice the sharp kinks in the ends of the stirrups, as these prevent the short end pulling out of the link when the binder is put into tension, and make the same tighten upon the bar as this pull upon the stirrup increases. It is more convenient, as a rule, to place such hangers or stirrups vertically, but they can be arranged at any angle. The "Leslie" linked hanger rigidly and securely clamps together the whole of the reinforcements in a beam or column, so that they cannot be put out of place by the operation of putting in the concrete within the moulds. It also has the advantage that the work can be inspected before this operation of filling in the concrete is begun. In fact, the hanger tightens up upon the main reinforcements under stress, and binds all the more closely to them, and completely resists any tendency to slip or slide along them, which means that the Leslie hanger develops great strength.

Some of the ordinary stirrups are not convenient from a practical point of view, as they cannot be kept up close against the main reinforcement, being all loose, and requiring to be pulled into place while the concrete is being rammed round them. When,

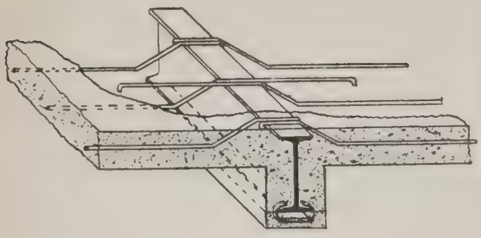

Fig. 6.—Reinforced Concrete Floor between Steel Joists.

as must be the case, the work is being executed by labourers we cannot, with even the most elaborate and careful supervision, be sure that these secondary reinforcements will keep the places for which they were designed, while the labour of putting in place and the cost of supervision are very considerable.

By employing "Leslie" linked hangers in beams, etc., the whole of the reinforcement can be assembled as a unit if desired, and dropped into place in the moulds, ready to be filled in.

From a practical point of view, as well as the point of view of theoretical efficiency, it is most desirable to have the whole of the reinforcement assembled in place and rigidly connected together, so that it can be inspected and passed by the superintending or resident engineer before being filled in. The ordinary labourer can then be left with safety to fill in the concrete without much supervision, but we must know that the reinforcement will remain in place with only a small liability of error such as is attributable to variations in workmanship. The great thing is reinforced concrete construction is to eliminate errors as much as possible, and Messrs. Leslie and Co., as contractors, thoroughly appreciate this important point.

Messrs. Leslie and Co. sometimes employ their linked hangers, or perhaps a few of them, for column reinforcements, though they often employ the type of binder shown in figure 3, from which it will be seen diagonal cross-braces are provided to perform the important function of reinforcing the core of the column. Concrete, as has been often emphasised in these pages, is comparatively weak in tension, though strong in compression. What we call shear failures are really failures by diagonal tension. The compression applied to a column is transformed into diagonal or transverse compression and tension. It is this tension which causes what is called a shear failure. If, however, we introduce reinforcements to cross the planes upon which the diagonal tension becomes excessive we make the concrete able to sustain a much greater load, and this is the function which the diagonal braces in the "Leslie" column are designed to serve. Tests on such columns have shown very great resistance, and considerable superiority over the older methods of binding longitudinal rods with simple links.

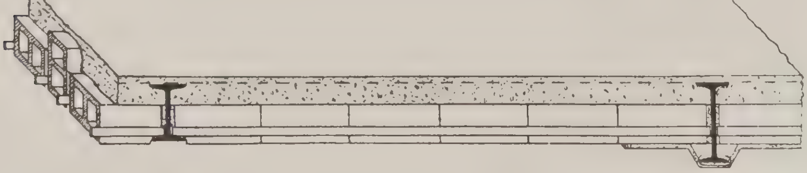

Fig. 7.—Reinforced Hollow-brick and Concrete Floor.

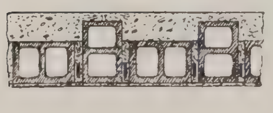

Fig. 8.—Section of Floor in Fig. 7.

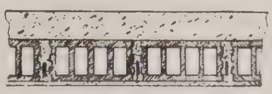

Fig. 9.—Alternative Section to Fig. 8.

Fig. 4 is a perspective view showing the manner in which Messrs. Leslie and Co. employ their hangers to the construction of a building with beams, columns and floor-slabs.

The advantages claimed for the "Leslie" linked system are, in short—

1. Rigid stirrups.
2. Stirrups any lengths and any spacing.
3. Complete truss action in beams.
4. No loose members.
5. All members completely framed as units.
6. Exactitude of disposition.
7. No risk of members being displaced.
8. Elimination of errors in workmanship.
9. Formed from ordinary standard sections of steel.
10. Fire resistance.
11. Economy of material and labour.

These claims will be appreciated by those who have studied the many systems of reinforced concrete.

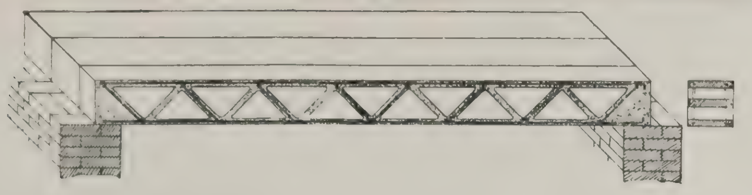

Fig. 14.—Floor of moulded Reinforced Concrete Lattice Girders constructed without Centering.

A Beamless System.

Messrs Leslie and Co. have also taken out patents for a special system of reinforced concrete construction by which wide spans of roofs or floors may be constructed with a small thickness of floor-plate, or slab, thus (1) eliminating the compartments which these beams form to obstruct the free flow of air for ventilation; (2) doing away with their obstruction to the distribution of light; (3) increasing the head-room; and (4) rendering the floor more fire-resisting.

This system is highly economical, as has been proved by competitions with other systems of construction. Not only is the appearance of the work considerably improved, but the above-mentioned claims will be readily appreciated. There is not much danger from a fire, for instance, playing upon the underside of a flat floor-slab; it is its action upon the beams which will most probably cause failure, and in this special system of Messrs. Leslie and Co. there are no beams for the fire to thus play upon. Improvement in ventilation and in lighting by the same elimination of beams is obvious, and among the incidental economies effected by the system—chief of which are the economies of centering, and the simplicity and reduction in the amount of steel—is the saving in head-room, so that, if desired, a building may be given the same head-room upon each floor as was intended to be provided with beam construction, and yet the total height of the building can be reduced by several inches at each floor level, which, in the case of a building of several storeys, would amount to some feet in total height. This saving, either estimated as cubical contents, or even as wall surface, apart from the extra load imposed otherwise upon the foundations, it will be easy to see amounts to a very considerable item.

Fireproof Floors.

Messrs. Leslie and Co. have worked out a number of designs for floors modelled upon earier types in order to meet all possible requirements in practice, and to suit every condition. With these, they offer the advantages of improvements effected by experience and study with more up-to-date knowledge, and Messrs. Leslie and Co. are prepared to guarantee efficiency, because they both design and construct the work.

Fig. 5 shows a system of constructing fireproof floors, which is more allied to the ordinary small joist and concrete floors than to pure reinforced concrete design. It is, however, often advantageous on a small job, by reason of the saving of the centering, as the centering is suspended from the main steel beams. It is sometimes also more speedy in erection. It will be seen that the system consists of hangers dropped over the beams into slots in which rods, tees, joists, or double cruciform bars are inserted. The rods and tees are the most suitable forms of reinforcement for the floor slabs between the main beams in this system of construction.

Another method that is advantageous where steel main beams are used is that shown in Fig. 6, in which it will be seen that rods are cranked up over the beams, and no hangers provided. This system is allied to that previously described and illustrated, and is even more economical of steel.

Fig. 7 shows a further system which has been designed to meet special requirements. This consists of a hollow brick floor reinforced with flat or round bars inserted between the bricks, which are laid with cement mortar and concrete filling applied at the top to provide sufficient compressive resistance, the steel taking the tensile stresses below.

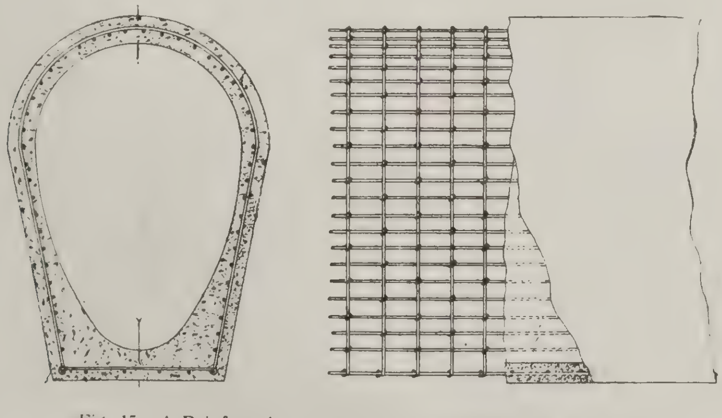

Fig 15.—A Reinforced Concrete Sewer of Egg-shaped Section.

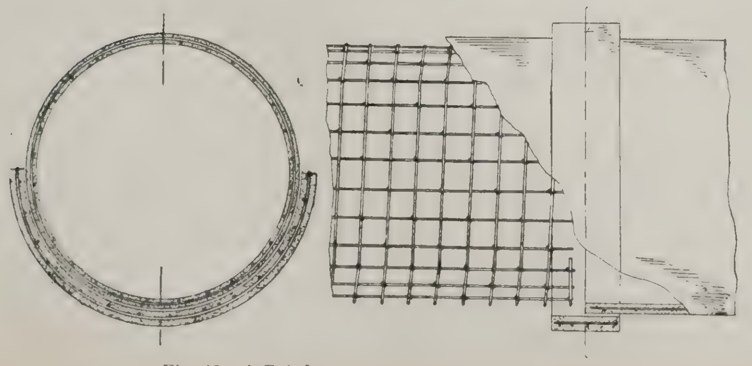

Fig. 16.—A Reinforced Concrete Pipe or Main.

Alternative sections of these hollow brick or terra-cotta floors are shown in Figs. 8 and 9, together with their concrete filling, and it will be seen from these that the floor practically consists of a series of T beams, with the bricks forming filling pieces in the nature of ceiling slabs. Such floors are sound resisting, and can be rapidly constructed. They are economical for steel frame structures.

Fig. 10 shows an extension of the system for complete reinforced structures where a heavier floor load is imposed, and a level ceiling is desired, and also where sound resistance is of importance. The main beams are of reinforced concrete, and the floor slab between becomes virtually a T-beam construction, the hollow brick or terra-cotta blocks serving simply the purpose of a ceiling slab. It will be seen from this view how the centering necessarily used in construction is economised, for boards are only needed to receive the edges of the blocks, and to retain the concrete filling.

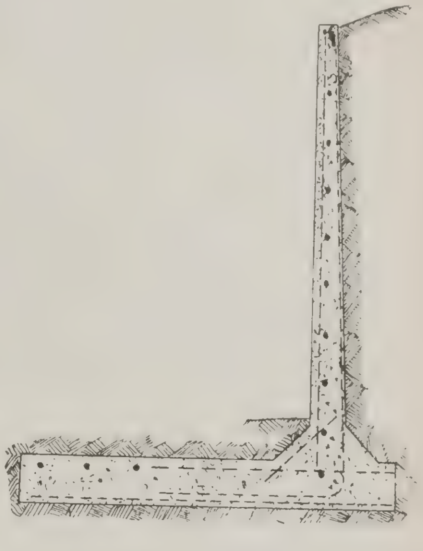

Fig. 17.—Section of a Reinforced Concrete Retaining Wall.

Figs. 11, 12 and 13 show other types of hollow floors in which reinforced concrete tubes are used, so as to secure a level ceiling, and render the floor more sound-proof than a solid floor.

Fig. 11 shows a type where the tubes are filled between rolled steel joists or bulb tees spaced at 3ft. or 4ft. centres. A bulb tee section is preferable to a joist, because the upper flange of the steel is only needed temporarily while it has to serve the function of a permanent centering. When the concrete filling has set it provides the compressive resistance needed.

Fig. 12 shows the manner in which similar tubes are used with reinforced concrete joists or ribs moulded in the shop. These moulded ribs of reinforced concrete can be conveniently made of any span up to 30ft., and as no centering is required, the system is extremely rapid in construction, and can thus be economically employed. The modification of the system (Fig. 13), in which the ribs are cast *in situ*, the only centering being a board placed as shown just to support the ends of the tubes, has its advantages in the way of economy in certain circumstances.

Fig. 14 shows another type of floor, which consists of a series of rectangular open lattice girders of reinforced concrete placed side by side. These can be easily made in the shop, and a stock kept ready for delivery to job, so as to expedite the work of construction. The floor being hollow, is sound-resisting, and a level ceiling is obtained below.

The foregoing are the general types of reinforced concrete floor construction which are adopted, but there are numerous modifications to suit special conditions. As a rule, every job has some peculiarity.

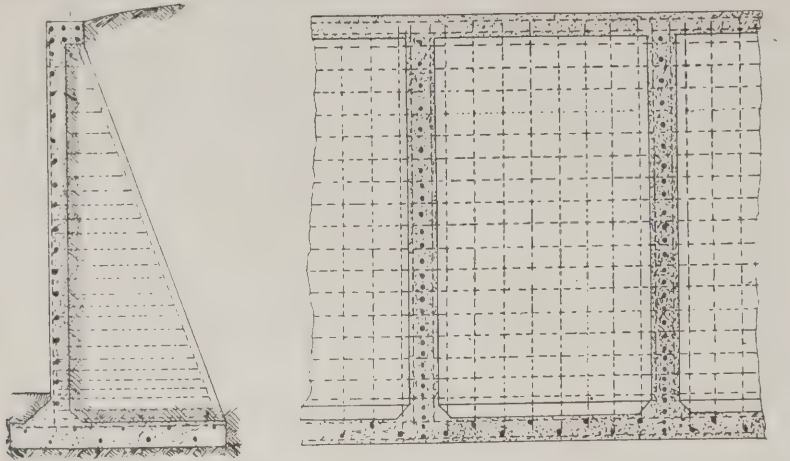

Fig. 18.—Cross and longitudinal Sections of a Reinforced Concrete Retaining Wall.

Pipes and Sewers.

Fig. 15 illustrates Leslie's method of reinforcing an egg-shaped concrete sewer which can be constructed *in situ*. The reinforcement consists of longitudinal bars wired to others of horseshoe shape, the latter being turned at the ends to suspend another meshwork of rods. In constructing this type of sewer, the economy of which is obvious by comparison with the ordinary egg-shaped sewer in brick, a sheet of metal centering is used, which can be reduced in diameter, withdrawn and re-erected easily.

Fig. 16 shows a reinforced concrete pipe or main suitable for conveying water, sewage or other liquids. This is not designed to be constructed *in situ*, but can be made in moulds placed at the sides of the trenches, and moved from stage to stage of the work, thus saving transport. Such pipes can be designed to resist great pressure, and are not only much cheaper than cast-iron pipes, both in first cost and in maintenance, but are often 50 per cent. or more less in weight than cast-iron pipes capable of resisting the same pressure. This is attributable to the fact that cast-iron is not a material strong in tension, and is also difficult to cast in circular form, whereas the spiral slab reinforcement, such as is provided to resist the hoop tension, consisting of mild steel rods, is so much stronger than cast-iron.

Retaining Walls.

Figs. 17 and 18 show two Leslie types of retaining wall, the economy of which is very great compared with the ordinary mass concrete or brickwork retaining wall. Fig. 17 shows a method by which a toe and a heel are provided, the latter extending away from the retained earth. Fig. 18 shows another type in which the toe extends for some considerable distance under the earth, and the portion projecting on the opposite side is very small. The weight of the earth itself bearing upon the toe prevents the structure overturning; buttresses are provided at points.

Messrs. Leslie and Co. also construct walls, steps, piles, bridges, piers and jetties, water-towers, etc., in all kinds of reinforced concrete. The firm also undertakes the construction of hollow or cavity plain or reinforced concrete, and brick wall construction, interlocking concrete block or slab partitions, artificial stone of every description, and structural steelwork and fire-resisting construction generally.

They issue a catalogue which deals generally with the subject of reinforced concrete, which will be found extremely valuable by anyone studying the subject. This catalogue also contains a useful standard specification, to be used as a basis for tendering.

Members of the National Federation of Master Builders deeply sympathise with Mr. James Storrs, J.P., of Stalybridge, a member of the Administrative Council (Northern Centre), whose brother, Mr. George Henry Storrs, was brutally murdered at his residence in Dukinfield last week. Mr. G. H. Storrs was a builder and contractor and millowner. It is supposed that his assailant has committed suicide.

THEORETICAL AND EXPERIMENTAL RESEARCHES.

(The figures in this article are Italian Weights and measurements. An Italian ton equal 2237.7lbs. English.)

(Concluded from page 289, *No.* 766.)

Beam III. The crack due to the tensile stresses and the diagonal cracks were noticed approximately under the same circumstances as in Beam I. The cracking is, however, expedited as the mechanical bonds of the steel separate from the concrete rather than adhere to it, so that the bars soon lose their adhesion to the mass (Fig. 15).

Beam IV. The steel bars are bent where the diminution of the bending moment permits. The force of adhesion of the single straight bar at the working load of 11.5 tons is calculated at 21.1 kg per cm2; it is, however, much higher. If the tensile force supported by the bent bars is calculated, we obtain a tension of $\sigma f = 1{,}000$ kg/cm2. At a load of 9 tons, when the first cracks due to the tension of the concrete appear, the adhesive stress amounts to 17.4 kg/cm2, a value which never appeared in the first three tests; and this is a further proof that the diagonal cracks are not due to the want of adhesive resistance between the steel and concrete. At a load of 33 tons, diagonal cracks are noticed, at which value $\sigma f = 53.5$ kg/cm2. At this value it seemed that the adhesive resistance was overcome, which lessened the resistance of the straight bar, and the nearer bent bar

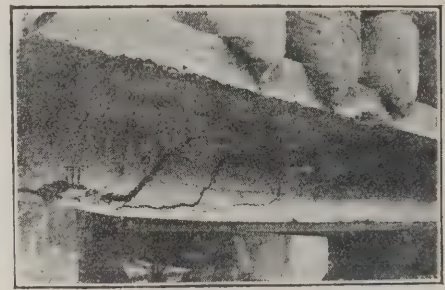

Fig. 15.—View of Beam III. test.

was found to have the most strain; this fact caused a separation of the concrete where the bar was bent, and hence the rupture. As a result, therefore, we see the necessity of securely fastening the straight bar, and also of the angle of the bent bars not being too sharp.

Beam VI. This is constructed in the same manner as No. IV., with the difference that the straight bar is not bent squarely at the end; it was, therefore, possible to observe the beginning of the slipping of the steel in the concrete. Besides, the stirrups are placed all the way along, and the intermediate bent bar is not brought up to the supports. The tensile cracks and the oblique cracks were noticed sooner than in Beam IV.—they were seen at a load of 19 tons, at which load the straight bar began to slip longitudinally.

The adhesion stress amounted then to 32.5 per kg/cm in accordance with direct tests. Rupture resulted at a load of 37.8 tons, as a result of the separation of the concrete close to the nearer corner. A comparison between Beams IV. and VI. shows that when the bending of the bar is done properly, the stirrups have no influence; but the square crook at the end of the straight bar is of great importance, as was shown by the lessened resistance of Beam IV. due to its absence. The destruction of the straight bar and the consequent increase of the load on the bent bar was noticed much sooner.

Beam V. The bars in this beam are placed as in ordinary reinforced beams, and the cracks were noticed exactly as in Beams I., II., and III. This shows that this system of reinforcement for evenly distributed loads without the straight bar stirrups does not resist the diagonal cracks. Beam V. car-

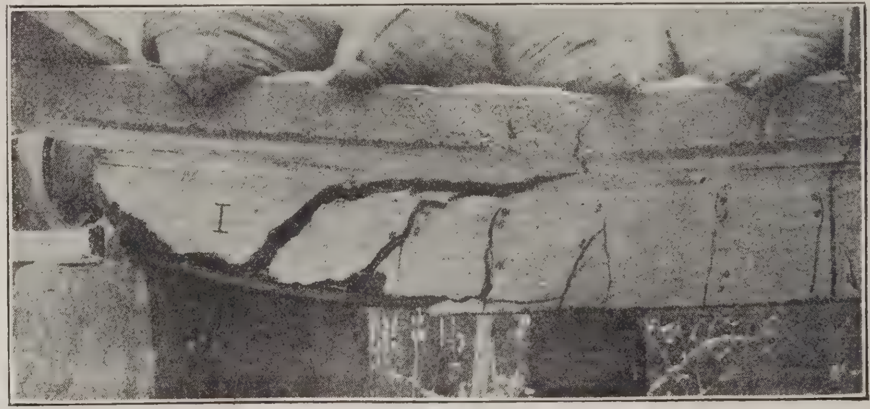

Fig. 14.—View of Beam I. test.

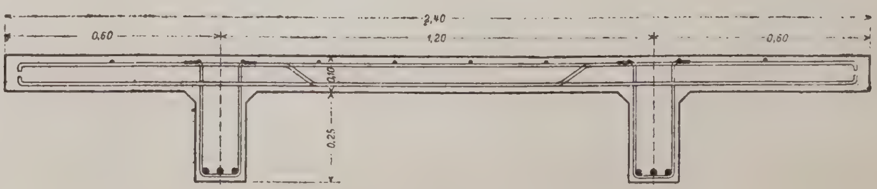

Fig. 13.—Arrangement of Beam.

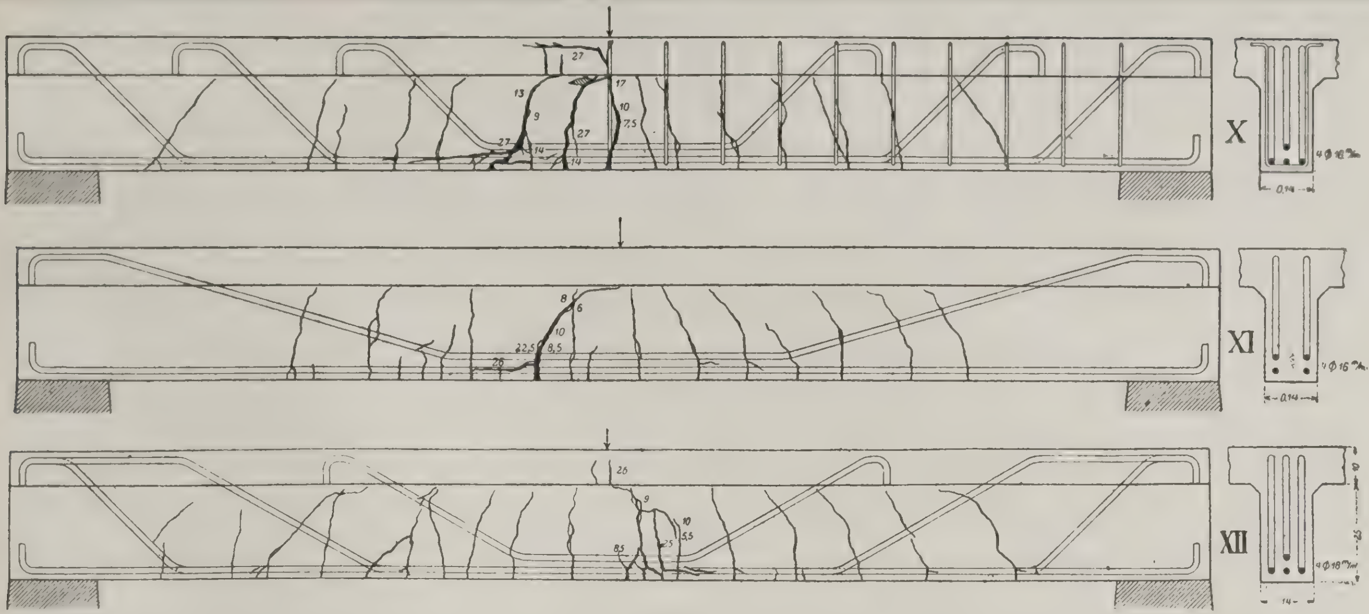

Figs. 10, 11, and 12. Beams with Loads concentrated in the Centre.

ried more than I. and III., and less than IV. and VI. The superiority of the other method of placing the reinforcing bars is clearly shown.

Group 1. Load Concentrated at Two Points.

Beam VII. This beam differs from IV. and V., inasmuch as the iron bars are bent up uniformly at three points, so as to keep the transverse forces constant, and corresponding with the lineal diminution of the bending moment. At a working load of $2P=9$ tons $\sigma f=1{,}010$ to $1{,}040$ kg/cm2 is obtained in the lower part, and in the corners. Except for the tensile cracks, which were first noticed in the middle, and which got bigger as the load increased, no other separation was noticed, and also the straight bars did not slip, notwithstanding the fact that at the moment of cracking the adhesive stress had reached 63 kg/cm^2. This high value is to be attributed to the stirrups which prevented the separation of the concrete.

Beam VIII. This beam has a narrow rib of 10 cm. If we suppose that the beam is constructed like an ordinary reinforced beam composed of a plain beam and of a complete reinforced beam, and that each of these elements bears half of the load, the supposition, if exact, ought to be confirmed in this case when the reinforcement keeps its equilibrium under the disposition of load which is adopted. Besides the tensile cracks at a load of 9.8 tons, a crack which is almost horizontal was observed above the curved bars, where τ_0 is calculated at 9.7 kg/cm2 (Fig. 16). Admitting that only half of the transverse force acts, and the other held is supported by the curved bars, $\tau_0=4.8$ kg/cm2 is obtained, and the crack would be sufficiently explained. At a load of 14 tons, the crack continued in a diagonal direction; at this point $\tau_0=14.2$ kg/cm2. It thus seems that the first crack was caused by the action of the transverse force; as a result, the action of the reinforcement made itself felt, so that the diagonal crack was only caused by the half of the transverse force, which corresponds to the value $\tau_0=7.1$ kg/cm^2. A comparison with the deflection of the ordinary plain reinforced beams confirms this result. In such beams the deflection resulting from the strain on the steel is much greater with the complete reinforcement than in the plain beam, so that the two elements do not act together at the beginning, but only after a certain load.

Beam IX. This differs from Beam VIII. by having a greater thickness of rib. The cracks formed in exactly the same manner; but these only appeared after a greater load had been applied (Fig. 17). The half which was furnished with stirrups kept in better condition, from which it is to be gathered that the presence of the stirrups in the beams at points where the steel is placed in ordinary beams is of great importance to the resistance of the beam, while in beams where the steel is placed as in IV. and VI., good results are obtained without stirrups. The question if, and in what measure, the ordinary reinforcing with stirrups is superior to that of IV. and VI. without stirrups, must be found out by new special tests.

Group 3. Load Concentrated in the Middle.

With these three beams, the action of the transverse force was secondary; these beams were broken in the middle. At the increase of the load only tensile cracks were formed, and the two half beams, with and without stirrups, acted in the same way. Rupture was caused by the opening of a middle crack and by the crushing of the concrete on the outside. According to calculation the tensile strain was then 4,050 kg per sp. cm; in reality, however, it was only 3,880 kg/cm2, because the compressed area, while being calculated as 7 centimetres, was only 2 centimetres high. The compression strain on the outside surface amounted to 262 kg/cm2, while the resistance to the crushing, measured on a cubic inch of material, amounted to 182 kg/cm2.

Beam XI. This acted exactly in the same way as Beam X. Beam XII. differed from Beam X. by the fact that both the middle bars were bent up at 30 degs. or 45 degs. Otherwise it acted in exactly the same way. This third group did not give any new interesting indications of the forces of shear, and of adhesion between steel and concrete, but it is worthy of notice on account of the tension at rupture which was observed in the steel, which exceeded the elastic limit. The large size of the compressed flange offers con-

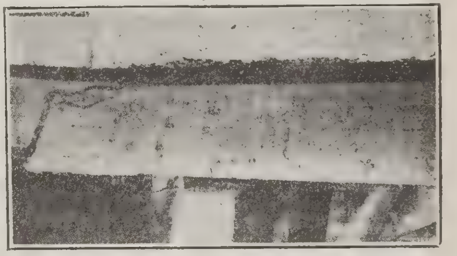

Fig. 17. View of test on Beam 9.

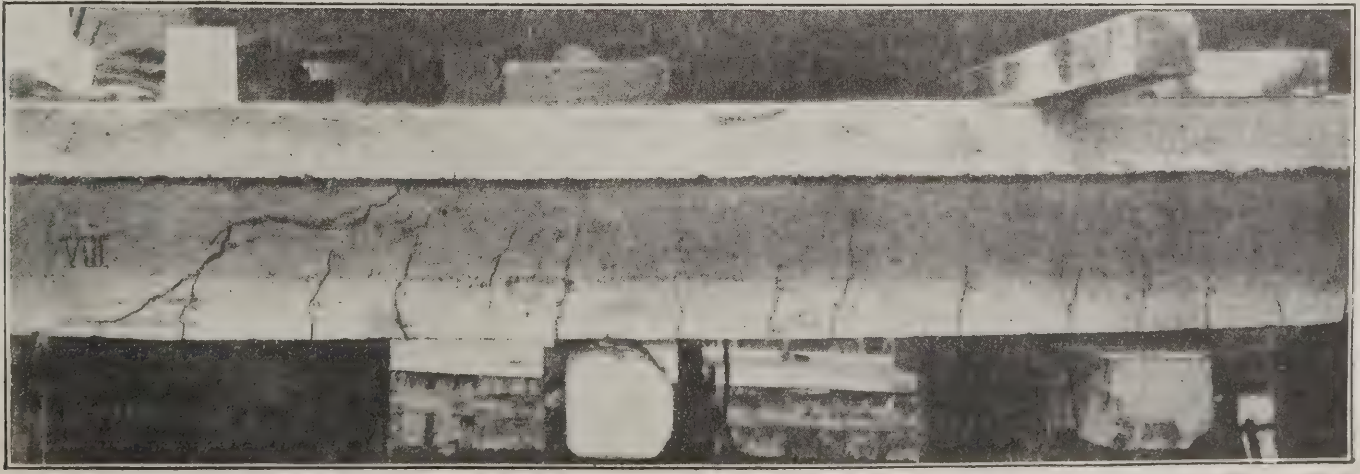

Fig. 16. View of test on Beam 8.

siderable resistance to the increased pressure on the extremities resulting from the lengthening of the bars.

Professor Morsch draws the following conclusions from his experiments:—The tests show that, besides the sectional area, the disposition of the reinforcement is a great safeguard against rupture. Reinforced concrete should not be studied solely for its own properties as a material for construction, but the formation of beams should be studied as constructive elements. The adhesion between the component materials cannot be determined by means of trial cubes or prisms, but only on beams which have to bear bending stresses if practical results are to be obtained.

It is particularly laid down that the disposal of the steel bars without reinforcing stirrups is very defective. From a practical point of view, the determination of the most favourable reinforcement is of greater importance than to determine the stresses due to limited loads, as this determination is not a practical guide for judging their safety against rupture.

Even if these tests do not clearly point out the necessity for the strengthening stirrups when the reinforcement is arranged rationally, yet their use is to be recommended, as they ensure a good union between the ribs and the flange, and strengthen the neutral part of the beam against bending strains.

The minute cracks which are produced at the commencement of the loading are of importance, when the calculation only takes into account the resistance of the concrete to tension; these cracks do not present any danger of rusting of the steel, because this is sufficiently protected by the skin of cement which surrounds it.

The theory of the extensibility of the concrete was not established by the tests.

SOME CAUSES OF FAULTY CONCRETE CONSTRUCTION.

Expansion or Contraction.

A common occurrence in the failure of concrete work caused by faulty aggregate, and in which the cement had been hurriedly and ignorantly asserted to be the cause of failure, is where a clay ballast or brick-rubbish aggregate is used, which contains an excess of sulphate of calcium or similar harmful ingredients.

Experiments to illustrate such an instance of concrete failure due to the aggregates employed have been arranged, with the following results. In the case of a large bulk of concrete composed of six of aggregate to one of cement, a well burnt and clean clay ballast was used with furnace cinders and sand in the proportions of three parts, two, and one respectively.

The concrete bulk after some weeks hardening commenced to expand and disintegrate and, as usual, the quality of the cement was first suspected. After a very thorough investigation, however, into the quality of the cement this alleged cause was abandoned, as the produce was found to be sound in every way. Then an inquiry into the separate aggregates took place, and sample blocks were prepared as follows and kept under supervision, viz.:—

A. Cement and furnace cinders (3+1)
B. Cement and sand ... ... (3+1)
C. Cement and ballast ... ... (3+1)

And after some ten days' exposure to the atmosphere it was found that block "C" disintegrated in the same way that the bulk concrete had expanded and fallen to pieces. The two sample blocks of the same cement when separately mixed with the sand and cinders forming the other portions of the aggregate were perfectly sound in every way. An enquiry was then made into the quality of the brick rubbish or ballast used as the main aggregate, with the result that it was found that an average sample contained sulphate and sulphite of calcium equal to 9.51 per cent., and the concrete bulk expansion must be attributed to expansion caused by those substances. In explanation of this result it might be added that the sulphate is contained in the original clay probably as pyrites, and upon burning the clay for ballast the sulphate becomes a sulphite. But in the concrete the oxygen contained in the atmosphere enters into combination with the sulphite, and forms a sulphate again, and in so doing expands and distintegrates the concrete.

Old Plaster Cement.

Great care is necessary in dealing with old concrete floors where plaster of Paris was the matrice. An instance has occurred where old concrete made 40 years since was broken up and re-used with Portland cement as a matrice, the result of which was the concrete expanded, and a failure was the result. It was necessary to raise an old floor of plaster concrete, and of the same age, 2 ins. This was done with Portland cement concrete, which, after the lapse of some time, heaved up in various places, and examination showed that it was the old plaster concrete that had swollen through contact with the water in the cement. This goes to prove that expansion of plaster of Paris used as a matrice in concrete takes place when water is applied many years after.

Change of Temperature.

It is often discovered that monolithic concrete walls after erection frequently disclose ugly cracks, almost amounting in some cases to fissures, and although no great diminution in strength is supposed to result, these cracks militate much in its disfavour. This has always been an objectionable feature to contend with in concrete.

These are caused through the natural phenomena of expansion and contraction with change of temperature. This change of form has been put down to a peculiarity of concrete which other wall and paving substances are not liable to. But this is a mistake, for it is simply the materials of which the concrete is made that expand and contract, and their conversion into concrete in no wise affects this property of contraction and expansion. True, there is none, or but little, palpable evidence of change of form in brick or stone walls, or brick or stone paving, but there is no mistaking it in concrete walls, or concrete paving. The reason is that the change is distributed so evenly throughout the multitudinous mortar joints of brick and stone work that it is imperceptible; brick walls built with cement will often show cracks here and there, usually put down to settlement, but which, in reality, are more often the result of contraction and expansion: if these cracks are watched it will be found that they close in mild weather and open again when the temperature falls. Mortar-built walls never show the effects of contraction and expansion, while cement-built walls frequently do, because mortar made with lime will withstand a certain amount of compression, while cement is practically unyielding, and, when set, incompressible.

The use of an unyielding material like Portland cement in jointing long lengths of coping or ridge tiles will cause the same thing. Massive brick piers at the end of a long wall, and against which the stone coping abuts, have been pushed more than an inch from the perpendicular, and ridge tiles lifted completely off their bed and broken from the same cause. According to experts, the linear expansion by heat from 32 degrees to 212 degrees of granite is one part in 1,267, of ordinary brick one part in 1,818, and of firebrick one part in 2,365, or ⅛in. in 24ft., and this ratio would apply to concrete walls or concrete paving where the aggregates were of a similar nature, and pro rata to the amount of variation of temperature they were subject to.

It has been usual to charge the matrice with the cause of expansion and contraction in concrete walls, but the quantity used is so small, if seasoned it is so little subject to change of form, and is so evenly distributed, that it perhaps has next to nothing to do with the result, and this is proved by the fact that good cement concrete, no matter whether used for walling, or paving, or other purposes, is unaffected in this way until a considerable change of temperature takes place.

Concrete Floors.

To save the bulging of walls in floor concrete construction, it is best to insert wood expansion strips round all floors before commencing, as was the practice when plaster of Paris was the matrice, and to remove them when the concrete is set, filling in the cavities with sand, and calling the attention of the architect or clerk of works to what had been done, and with what motive. The cost is trifling, and any future trouble need not then interest the floor contractor.

(*To be continued.*)

Federation News.

LONDON MASTER BUILDERS' ASSOCIATION.

Secretary: T. Costigan.

A special Council meeting of the London Master Builders' Association was held at 31 and 32, Bedford Street, Strand, W.C., on Thursday, November 4th, the president (Mr. F. G. Rice) in the chair.

The meeting was largely attended, and much interest was displayed in the various subjects submitted for consideration.

The proofs of the pamphlet about to be issued were considered, and instructions were given as to their circulation. A question arose as to the radii observed by the London County Council and the London Master Builders' Association; twenty miles from Charing Cross being adopted by the former body as its limit, while the latter body had a radius of twelve miles from the same centre as set out in the working rule agreements with the different trade societies. Eventually the Council decided to adhere to its own limitations, and to limit its operations to the twelve-mile radius.

A very interesting discussion on the work of the Organisation Committee took place, in which Mr. F. Higgs (chairman of that committee), Mr. C. Bird Godson, Mr. Frank May, Mr. W. Lawrence, jun., Mr. John Garrett, Mr. Ernest J. Brown, and Mr. H. W. Horner took part.

Mr. G. Bird Godson referred to the question of tendering without quantities being supplied, and to the hardship imposed on builders by having to take out their own quantities. He suggested that the matter be ventilated by deputations from the London Master Builders' Association to wait upon the Royal Institute of British Architects and other professional bodies concerned.

Mr. Ernest J. Brown gave the views of the National Federation, and said it was a matter which every effort would be made to remedy.

The Council fully sympathised with Mr. Godson's views, and determined to ask the Royal Institute of British Architects and other bodies to receive a deputation.

The resolutions passed at the conference with the Quantity Surveyors' Association, on October 13th last, had been sent to the members of the Council, and it was resolved to send the following to each member of the association. The discussion on it was entered into by Mr. Ernest J. Brown, Mr. Frank May, Mr. W. F. Wallis, and others, and it was resolved: "That the conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities, prepared by a fully qualified quantity surveyor, being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost £500 and upwards."

A letter advocating the preferential employment of registered plumbers was read, and the views entertained and expressed upon much the same subject by the Institute of Builders were given. The Council was of opinion that the persons engaged should be judged by their practical, and not by paper, qualifications.

Messrs. D. Burkle and Son, of 34, Osnaburgh Street, N.W., were elected a member of the association, on the nomination of Messrs. H. C. Cleaver, Ltd., seconded by Mr. G. Bird Godson.

Yorkshire Federation.

The monthly meeting of the Executive Council was held at the George Hotel, Selby, on Thursday, October 21st. Mr. W. R. Thompson (President) occupied the chair, and was supported by 41 delegates from the federated associations.

Mr. Mark Scott, the chairman of the Selby Urban District Council, was present, and offered a civic welcome to the members. On the motion of the President, seconded by Councillor W. G. England, J.P., the best thanks of the Federation were tendered to Mr. Mark Scott for the kind reception he had extended to the Federation, and for the esteemed references he made to the local members, which were highly valued.

The minutes of last meeting were read and approved. Apologies for absence were reported from the Right Hon. The Lord Mayor of York (Ald. J. Birch), Councillor G. Mansfield, J.P. (York), Alderman W. H. Jessop, J.P., Councillors J. W. Mallinson and J. Dawson (Huddersfield); Mr. H. Fallas (Wakefield), and Mr. J. Biggin (Sheffield).

The President reported that Mr. H. Fallas, of Horbury, had sustained a heavy loss in the death of his wife since the last meeting of the Federation. A resolution of sympathy and condolence had already been forwarded and a letter of reply from Mr. Fallas was read.

The President called attention to the serious illness of Alderman W. H. Jessop, J.P., and reported that although still confined to his room, he was making steady progress towards recovery. It was resolved, on the motion of the President, seconded by Mr. A. J. Forsdike, to express to Alderman W. H. Jessop, J.P., the deep regret with which the members had heard of his serious illness.

The treasurer reported receipt during the month of £32 10s. towards the National Reserve Fund, and of £30 16s. for subscriptions. The Finance Committee reported that they had examined the account in connection with the Conference of Secretaries, and, on the motion of Mr. W. T. Ledgard, seconded by Mr. A. J. Forsdike, the account was approved and payment ordered.

The treasurer called attention to the fact that, notwithstanding the receipt of £32 10s. on account of the National Reserve Fund during the month, he still required a sum of £94 13s. 10d. to stand clear on this account at the end of the financial year. If the local associations who had made definite promises in 1906 paid the half of such amount, he estimated he would be able to meet the payment. He therefore earnestly appealed that these associations would do their utmost to support the Federation, and to honourably and loyally co-operate with the other associations who, under trying circumstances, had faithfully carried out their promise. The treasurer further pointed out that he had, for the current year, only an excess of income over expenditure of about £54; and that several sums of considerable amount would fall due for payment next month. The members would therefore realise the paramount necessity of strenuous efforts being made by every local association in order that the liabilities of the Federation should be promptly discharged, and their financial prestige worthily maintained.

The President reported that the Finance and Emergency Committee had under consideration the question of proper storage of the various books and documents belonging to the Federation, and recommended that some arrangement should be entered into by the Federation, the Leeds Master Builders' Association, and the secretary, for increased accommodation. On the motion of the President, seconded by Mr. J. Townsley, the question of office accommodation was referred to the Finance and Emergency Committee for consideration and report.

A form of sub-contract, submitted by Mr. W. H. Hope, solicitor, of Sunderland, together with covering letter, was considered. It was resolved, on the motion of Councillor W. G. England, J.P., seconded by Mr. W. T. Ledgard, to request the local associations to take the draft into careful consideration, and to favour the Federation with their approval, or any suggested amendments, not later than November 11th.

A report was presented as to the present position of the case at Dewsbury arising out of the unwillingness of a local architect to waive the clause in the contract by which he was appointed sole arbitrator. The matter is still *sub judice*, on account of the difficulty in arranging for a meeting of the trustees.

Letters were read as to the custom in connection with final certificates, and reports given as follows:—The custom in London is for the architect, after seeing his client with the accounts, and getting him to sign same, to issue the final certificate to the builder.

The Secretaries of the Lancashire, Cheshire and North Wales, Northern Counties, and Midland Federations stated that the general practice in their districts is to issue the final certificate to the contractor. It was further pointed out that Clause 30 of the National Form of Contract provides, with respect to instalments, that:—"The contractor shall be entitled under the certificates to be issued by the architect to the contractor," etc.

With respect to the completion of works and payment of retention money, Clause 30 further provided:—"The contractor shall be entitled, under the certificate to be issued by the architect, to receive payment of," etc. "The architect shall issue his certificates in accordance with this clause."

Several members called attention to the absolute necessity of every member loyally cooperating in reminding architects of the standard custom in this matter, and respectfully asking their strict and kind conformity thereto. Several instances were given of the serious inconvenience and unnecessary loss caused to contractors arising out of undue delay in issuing the final certificate.

Attention was called to the recent decision of the Court of Appeal in William Kennedy, Ltd., v. Mayor and Corporation of Barrow-in-Furness, of which particulars were given last week.

A letter was read from the National Federation with respect to the formation of the Local Joint Committees for hearing and settling disputes provided in the revised agreement with the plasterers. In towns where there is a master plasterers' association it was recommended that the master builders' association and the master plasterers' association should mutually agree as to the proportion of representatives for the employers' section, and request the operative plasterers to appoint an equal number. In towns where there is no separate master pasterers' association, and an operative plasterers' branch has been formed, the master builders' association were recommended to appoint the employers' representatives if the master plasterers were members of the master builders' association. Local associations were asked to give the matter urgent attention, in order that the local committees may be formally constituted at the earliest possible date.

The President reported that the National Conference of Secretaries had been held at Leeds on Tuesday, October 19th, and that the attendance showed an increase on last year. Several interesting papers were read, and evoked considerable discussion. He urged members to read the reports in the "Builders' Journal," as they would find subjects not only of interest to Secretaries, but also of considerable trade importance. On the motion of the president, seconded by Mr. W. T. Ledgard, it was resolved to convene a conference of Yorkshire Secretaries at the conclusion of the next meeting of the Federation, and earnestly to urge upon the secretaries of all Federated associations the expediency of making arrangements to ensure their presence on that occasion. The President reported that a meeting of the Northern Centre had been held at Leeds on October 18th, at which it was decided not to submit any proposals this year for amendment of Conciliation Board rules.

The Chairman reported that a meeting of the National Administrative Committee had been held on October 12th, when it was reported that representatives of the National and other Employers' Federations had been favoured with an interview by Sir H. L. Smith, the Permanent Secretary of the Board of Trade, with respect to the suggested rules for the Labour Exchanges.

It was reported that a meeting of the Northern Centre Conciliation Board had been held at Leeds on October 11th to consider an appeal from the Liverpool Local Conciliation Board with reference to the interpretation of the joiners' rule for extra payment for insulation work on cold storage work. The matter was thoroughly discussed, but the employers' representatives could not accept the operatives' interpretation of the rule, and as the opinions were so divergent, it had not been found possible to arrive at a decision.

The Chairman reported that a meeting of building trade employers had recently been held at Skipton, and that the attendance was satisfactory. A resolution was unanimously passed to form a local association for Skipton and district, and a committee was appointed to prepare draft rules and submit same to a further meeting.

A letter was read from the Leeds Association asking the consent of the Federation to notices being given to the masons, bricklayers, and labourers, for alteration of winter working hours, to avoid a stoppage for breakfast, and for a counter-notice being given within fourteen days by the party receiving notice for alteration of rules. On the motion of Mr. A. J. Forsdike, seconded by Councillor W. G. England, J.P., the Federation gave their consent to the Leeds Association giving notice in accordance with their request.

Mr. Clements, of Featherstone, called the attention of the Federation to the difficulty and expense he was experiencing in connection with an accident which occurred to a workman at a time when his risks were not covered by insurance. The accident occurred in May, 1907, and at the time it was thought that the only injury was a fracture to the collar-bone. Subsequently the workman was troubled with a chest complaint, which the doctor stated was consequent upon the accident. The case had been before the court on two or three occasions, and as there was considerable conflict in the opinions of the medical witnesses, the judge had ordered the continuance of payment of half wages. Mr. Clements was requested to send full particulars to the Federation Secretary. Attention was called to the grave financial risk which an employer ran by not being fully insured, and members were urged to give this matter prompt attention as renewal became due.

The arrangements for next meeting were left in the hands of the president and secretary.

The members, under the guidance of Mr. Ullathorne and the clerk of works, inspected the work in restoration of Selby Abbey, and were afterwards entertained to tea by the President and members of the Selby Association. The vicar of Selby expressed the pleasure he had in being present, and of being given an opportunity of testifying to the lasting work in connection with the restoration of Selby Abbey, which had been faithfully and skilfully carried out by a local contractor.

J. Davidson, Secretary,
14, Park Row, Leeds.

Messrs. Archibald, Smith and Stevens, of Janus Works, Queen's Road, Battersea, have for family reasons converted their business into a Limited Company, under the title of Smith, Major and Stevens, Ltd. No shares have been offered to the public, and the previous owners, Messrs. C. G. Major, E. C. Stevens, and P. H. Stevens, together with Mr. P. C. Major, become directors, with Mr. C. G. Major as chairman.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 10. **LEEDS.**—Contractors desirous to tender for the erection of billiard-room to the North-West Liberal Club, are requested to send their names by above date to J. W. Thackray, M.R.S.I., Architect, 4, Greek Street, Leeds.

Nov. 10. **NORTHFLEET, KENT.**—Erection of a new department to accommodate 400 boys at Dover Road Council School, Northfleet, Kent, for the Education Committee. Plans and specification, prepared by the Committee's Architect, Wilfrid H. Robinson, M.S.A., may be inspected at the office of the Committee from Nov. 10, until the time appointed for the delivery of tenders. Persons desiring to tender and receive copy of bills of quantities must send names, accompanied by a deposit of £1, by noon to-day, to Fras. W. Crook, Secretary, Caxton House, Westminster, S.W. Tenders, endorsed "Northfleet Tender," to be sent to F. Mitchell, 49, Windmill Street, Gravesend, Kent.

Nov 13. **WINCHESTER.**—Builders desirous of tendering for the erection of a new high school boarding house at Winchester, are requested to send their names, not later than above date, to Colson and Nisbett, Architects, 45, Jewry Street, Winchester, where plans and specification may be seen and quantities obtained.

Nov. 15. **CAERPHILLY.**—Building three houses, etc., on site of Old Parrot Inn. Plans and specifications may be seen at the office of C. M. Davies, 112, High Street, Merthyr, until Nov. 15, when tenders are to be delivered to D. Williams and Co., T.V., Brewery, Merthyr.

Nov. 15. **SKELMANTHORPE.**—Erection of a lodge and entrance gates, Commercial Road, Skelmanthorpe. Plans may be seen and bills of quantities obtained of J. Berry, Architect and Surveyor, 3, Market Place, Huddersfield, to whom tenders are to be sent.

Nov. 15. **MERTON, S.W.**—Erection of a block of five cottages and a block of eight cottages, in Mill Road, Merton Abbey Estate, High Street, Merton, S.W. Plans and specifications (no quantities) can be seen with Henry R. G. S. Smallman, A.R.I.B.A., 8, Queen Street, Cheapside, E.C., to whom tenders are to be sent.

Nov. 15. **BURY (Lancs.).**—Building vaults (single and double) required at the cemetery during next twelve months, for the Corporation. Drawings may be seen and specifications and forms of tender obtained upon application at the Borough Engineer's Office, Bank Street, Bury. Sealed tenders, endorsed "Vaults," to be forwarded to the Town Clerk, Bury.

Nov. 15. **LIVERPOOL.**—Execution of bricklayers' work required in the construction of area walls and keeper's quarters, at new chief offices for the Royal Liver Friendly Society, Liverpool. Plans and specification and copy of the bill of quantities (on deposit of £1), at the office of W. Aubrey Thomas, Architect, 14, Dale Street, Liverpool. Tenders, endorsed "Tender for Royal Liver Buildings, Area Walls, etc.," to be addressed to the Secretary, Royal Liver Friendly Society, Prescot Street, Liverpool.

Nov. 15. **CARRICKMORE (Ireland).**—Erection of stationmasters' houses at Carrickmore, Keady, and Creaghanroe, and also a cottage, about ¾ of a mile from Castlewellan Station, for the Great Northern Railway Company (Ireland). Plans and specifications at the office of W. H. Mills, Engineer-in-Chief, Amiens Street Terminus, Dublin, or copies at the office of the District Engineer, Belfast, and can obtain at the said offices forms of tender on payment of 1s. each (not returnable). Tenders should be delivered to T. Morrison, Secretary, Secretary's Office, Amiens Street Terminus, Dublin.

Nov. 16. **GARNDIFFAITH (near Pontypool).**—Extensions and alterations to be carried out at the Bethel Primitive Methodist Chapel, Garndiffaith, for the Trustees. Plans and specifications may be seen at the offices of A. Gordon Babbidge, Architect and Surveyor, Clarence Chambers, Pontypool. Tenders to be sent to the Secretary, A. D. Williams, 37, Percy Street, Garndiffaith.

Nov. 16. **BETHNAL GREEN.**—Repairs to the Relief Hall of their Administrative Offices, Bishop's Road, Victoria Park, N.E. (nearest station, Cambridge Heath, G.E.R.), for the Board of Guardians. Forms of tender and specification of the work may be obtained on deposit of £2 2s., of D. Thomas, Clerk to the Board, Guardians' Administrative Offices, Bishop's Road, Victoria Park, N.E.

Nov. 16. **BARNBY MOOR (near Retford).**—Persons desirous of tendering for the whole of the various trades required in the erection of a new house at Barnby Moor, near Retford, for J. T. Spencer, are requested to send their names to G. A. Wilson, Architect, Hartshead Chambers, Sheffield, on or before above date, when bills of quantities will be sent.

Nov. 16. **ACTON.**—Execution of (a) erection of a 30-bed ward pavilion at the Isolation Hospital, Wales Farm Road, Acton, W.; (b) making-up and paving passages, Valetta Road, Acton, W.; for the U.D.C. Plans and specifications may be seen, and bill of quantities and forms of tender obtained, on application to D. J. Ebbetts, Surveyor, 57, High Street, Acton. Tenders, sealed and endorsed "Hospital Pavilion" or "Valetta Road Passages," must be delivered to Wm. Hodson, Clerk to the Council, Council Offices, 242, High Street, Acton, W.

Nov. 16. **LEEDS.**—Execution of the whole of the work required in the alterations, etc., of the Queen's Lodging House, East Street, Leeds, and in the alterations of houses into houses and shops, Beeston Road, Leeds, for the Corporation. Specification and plan can be seen, and bills of quantities obtained for the latter on and after Nov. 8, from W. T. Lancashire, City Engineer, Municipal Buildings, Leeds. Tenders, properly endorsed, must be received at the Town Clerk's Office, Town Hall, Leeds.

Nov. 16. **TOTTENHAM.**—Erection of a permanent school to accommodate 1,420 children, on the Crowland Road site, for the Education Committee. Applications for quantities to be made to the Architect, G. E. T. Laurence, A.R.I.B.A., 22, Buckingham Street, Adelphi, W.C., where plans and specification may be seen. Quantities will be supplied on deposit of £2 2s. Persons tendering will be required to deposit with W. Mallinson, Clerk to the Committee, Education Offices, Philip Lane, South Tottenham, N., when handing in their tender, in Bank of England notes or cash, the sum of £10. Fair wages clause.

Nov. 16. **DURHAM.**—Erection of new Council school at Haswell, and removal of iron school from Harlow Green to Easington Colliery, for the County Council. Plans, specifications, and general conditions of contract may be seen, and bills of quantities obtained, as follows:—(1) for Haswell school (810 scholars), at the office of W. Rushworth, Shire Hall, Durham; (2) for removal of iron school at Harlow Green to Easington Colliery (plans, specification, and general conditions only), at the office of F E. Coates, Shire Hall, Durham. Sealed tenders (endorsed with name of school) are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

Nov. 17. **BURY.**—Construction of about 50 yards of stone and brick and concrete culverts, 3ft. 10ins. by 6ft. 8ins., at Goodlad Street and Walshaw Road, for the Corporation. Drawings may be seen and specifications, bills of quantities, together with forms of tender, obtained upon application to Arthur W. Bradley, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, Bank Street, Bury. Tenders to be delivered to the Town Clerk, Bury.

Nov. 17. **LONDON.**—Extension of the Branch Post Office and Sorting Office, Notting Hill, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract, may be seen on application to J. Wager, A.R.I.B.A., H.M. Office of Works, Carlisle Place, S.W. Bills of quantities and forms of tender may be obtained at Storey's Gate on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Nov. 17. **FERMOY.**—Erection of six labourers' dwellings, at Wolfe Tone Park, Fermoy, together with the construction of footpaths, fences, etc., also laying sewerage and water supply in connection therewith, according to plans and specification prepared by D. J. Buckley, C.E., M.R.I.A.I., Cork, which may be examined and copied at the office of the Urban Council, or of the Architect. Forms of tender may be obtained from the Clerk or the Engineer. Sealed tenders, endorsed "Labourers' Dwellings," will be received by P. J. Lane, Town Clerk of Fermoy, Council Chamber, Courthouse, Fermoy. £20 deposit must accompany each tender. Contractor will be liable under the Workmen's Compensation Acts, or the Employers' Liability Acts.

Nov. 17. **LONDON, S.W.**—Construction of a store building and other contingent works, on land situate at the Battersea Works of the Board, London, S.W., for the Metropolitan Water Board. The drawings, conditions of contract, and specification may be inspected at the offices of the Chief Engineer, Savoy Court, Strand, W.C. Contractors desirous of tendering may obtain forms of tender, conditions of contract, specification, list of drawings, and bills of quantities, from the Chief Engineer, on the production of an official receipt for the sum of £10, which sum must be deposited with the Accountant, at Savoy Court, Strand, W.C. Tenders, enclosed in sealed envelopes, must be addressed to the Clerk, Metropolitan Water Board, Savoy Court, Strand, W.C.

Nov. 18. **LOUGHBOROUGH.**—Alterations at the Hicking's School, Ashby Road, for the Education Committee. Plans may be seen and schedule of quantities obtained upon deposit of £1 1s., with Barrowcliff and Allcock, Architects, Town Hall Chambers.

Nov. 18. **LIVERPOOL.**—Pointing, etc., the buildings of the administrative block and the nurses' home at the Infirmary, for the West Derby Union. Specification may be seen at the office of the Steward, on the premises. Tenders to be sent to Harris P. Cleaver, Union Clerk, Union Offices, Brougham Terrace, West Derby Road, Liverpool.

Nov. 18. **HULL.**—Erection of a school in Sidmouth Street, for the Corporation. Drawings and specification may be seen with Joseph H. Hirst, City Architect, Town Hall, Hull, and quantities obtained upon deposit of £2 2s. Remittances to be made payable to the City Treasurer. Tenders are to be addressed to the Secretary of Education, and delivered at the Education Offices, Hull.

Nov. 18. **LEEDS.**—Additions and alterations to the Divisional Police Station, Millgarth Street, for the Corporation. Plans and specifications may be seen, and bills of quantities, together with the general conditions of contract and forms of tender, obtained, at the offices of the Architect, Archibald Neill, F.R.I.B.A., 38, Park Row. A deposit of £1 1s. will be required. Tenders must be delivered at the Town Clerk's Office.

Nov. 18. **BLACKBURN.**—Erection of the new Council School, Bangor Street, Blackburn, for the Corporation. Forms of tender and bills of quantities may be obtained from the Architects, Cooper and Slater, 13, Richmond Terrace, Blackburn, on deposit of £1 1s. Contractors are requested to send in their names to the Architects immediately. Tenders for the whole of the work, endorsed "New Council School, Bangor Street," to be delivered to Lewis Beard, Town Hall, Blackburn.

Nov. 19. **ALMONDBURY.**—Various works required in the erection of a schoolroom, etc., for the Trustees of Zion Chapel. Quantities may be obtained, and drawings and specification inspected at the office of Norman Culley, A.R.I.B.A., Architect, 13, John William Street, Huddersfield, to whom tenders are to be sent.

Nov. 19. **WAKEFIELD.**—Whole or separate tenders for the following works:—Laughton-en-le-Morthen New School, Wickersley New School (builder, joiner, plasterer, slater, plumber, painter), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the West Riding Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, must be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Nov. 20. **PLYMOUTH.**—Erection of stabling for about 30 horses, in Plymouth. Plans and specifications can be inspected on application to Truscott and Sons, Octagon Mews, Plymouth, to whom sealed tenders should be delivered.

Nov. 20. **WORKINGTON.**—Execution of the several works required in the erection of an extension to the meter-house at the Stainburn reservoir, for the Corporation. Plans and specification may be seen at the office of H. B. Williams, Borough Engineer and Surveyor, Town Hall, Workington, to whom tenders are to be sent.

Nov. 20. **WILLINGDON, ETC. (Essex).**—Execution of the following works for the East Sussex Education Committee:—1, Erection of a new school and master's house at Willingdon; 2, erection of a new school and master's house at Broad Oak, Heathfield; 3, alterations to the girls' and infants' school, South Road, Newhaven. Names and addresses to F. J. Wood, County Surveyor, County Hall, Lewes, from whom full particulars can be obtained.

(Continued on page xxiii.)

Nov. 20. **BURY ST. EDMUND'S.**—Provision of a cookery room, assembly hall, and alterations to the county school and P.T. Centre, Bury St. Edmund's, for the W. Suffolk Education Committee. Specification and form of tender may be obtained on application to the Building Inspector, A. Ainsworth Hunt, Shire Hall, Bury St. Edmund's. Sealed tenders, addressed to Fred. R. Hughes, Secretary to the Education Committee, Shire Hall, Bury St. Edmund s, are to be delivered at the County Education Offices, endorsed "County School and P.T. Centre."

Nov. 22. **ABERTILLERY.**—Construction of a large swimming bath, boiler house, and other buildings for the Committee of the Powell's Tillery Workmen's Institute, Abertillery. Plans may be seen with the Secretary, C. W. Spalding, Powell's Tillery Institute, Abertillery, or with W. Beddoe Rees, Architect, 3, Dumfries Place, Cardiff. Tenders are to be delivered to the Secretary.

Nov. 22. **STANLEY (Co. Durham).**—Erection of new offices, in Front Street, Stanley, for the U.D.C. Bills of quantities and forms of tender may be obtained from, and plans and specifications seen, at the office of the Clerk, or the Architect for the work, John W. Wilson, No. 3, Coleshill Street, Sutton Coldfield, Warwick, on deposit of £2 2s. Tenders must be sent to John Geo. Ridley, Clerk to the Council, Stanley, R.S.O., Co. Durham.

Nov. 22. **PONTYMISTER (Mon.).**—Erection of 34 houses at Pontymister, for the Risca U.D.C. Plans may be seen and a copy of the specifications obtained upon application to A. J. Dardis, Council Offices, Risca, Mon., Engineer to the Council, on deposit of £2 2s. Tenders must be sent to T. S. Edwards, Clerk, 24, Stow Hill, Newport, Mon. The person whose tender is accepted will be required to enter into a contract and bond with two approved sureties in £1,000. Fair wages clause.

Nov. 22. **WICK.**—Execution of mason, carpenter and joiner, slater, plumber, and plaster work, in connection with erection of proposed U.F. Manse at Wick, for the Deacons' Court. Persons desirous of tendering may obtain copies of schedules and conditions of contract on application to Wm. Sutherland, Ashley House, Wick. Drawings may also be seen there. Tenders must be returned to Gardner and Miller, Architects, 144, St. Vincent Street, Glasgow.

Nov. 23. **PLYMOUTH.**—Supply, delivery, and fixing of No. 4 ornamental shelters in the pleasure grounds, for the Corporation. Tenders, accompanied by designs, detail drawings, and specifications, are invited for carrying out this work, must be delivered to James Paton, Borough Engineer and Surveyor, Municipal Offices, Plymouth.

Nov. 23. **LONDON.**—Extension of the Royal Courts of Justice, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract, may be seen on application to Sir Henry Tanner, I.S.O., F.R.I.B.A., H.M. Office of Works, etc. Bills of quantities and forms of tender may be obtained at Storey's Gate, on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Nov. 23. **PONTYPRIDD.**—Designs and tenders for the erection of iron buildings on a site in Court House Street, Pontypridd, for the Union. A block plan of the site and of the size of the suggested buildings, together with a short description, may be seen not later than above date, with Wm. Spickett, Clerk, Union Offices, Pontypridd, to whom tenders are to be sent. Designs and tenders must be endorsed "Iron Buildings," and delivered to me at my office not later thon 10 a.m. on Wednesday, the 1st day of December.

Nov. 24. **INVERNESS.**—Execution of mason and carpenter work, for the Corporation. Plans may be seen and specifications, schedule of quantities, and form of tender obtained at the office of the Burgh Surveyor. Offers, marked "Tramway Scheme Contract No. 2," will be received by the Burgh Surveyor.

Nov. 24. **RHONDDA VALLEY.**—Erection of 28 houses at Tynycae, Penygraig, Rhondda Valley, for the Tynycae Building Club. Names and addresses should be sent to W. M. Lewis and T. Naunton Morgan, Architects and Surveyors, Tonypandy and Pontypridd. Tenders are to be sent to the Secretary of the Club, A. J. Williams, Old Bank Chambers, Pontypridd.

Nov. 24.—**HOMERTON, N.E.**—Demolition of cottages, Nos. 35 to 50 (inclusive), Crozier Terrace, High Street, Homerton, N.E., and the erection of boundary walls, for the Hackney Union. Specifications, conditions of contract, and forms of tender can be obtained of the Clerk, and drawings may be seen at the Guardians' Office, Sidney Road, Homerton. Tenders must be delivered to Frank R. Coles, Clerk to the Guardians. Sureties required.

Nov. 24. **MOGERHANGER.**—Erection of a new Council school at Mogerhanger, for the Bedfordshire C.C. Drawings, specifications, and form of contract may be inspected at the County Surveyor's Office, Shire Hall, Bedford. Builders desirous of tendering must send their names and addresses to the Architect, H. Leete, Monthermer, Huntingdon, by Nov. 14, together with a deposit of £1 1s. Tenders must be sent to W. W. Marks, Clerk of the County Council, Shire Hall, Bedford

Nov. 24. **ALDEBURGH.**—Removal of the upper portion of the existing brick water tower at Aldeburgh, including the roof, cast-iron tank holding 11,000 gallons, girders and internal fittings, and the construction of a new steel tank to contain 35,000 gallons upon steel columns and joists fixed inside the tower, and re-building the walls of the tower to a greater height, together with the necessary connections to the mains, staircases, etc., for the Corporation. Drawings may be seen and copies of the specification, bills of quantities, etc., obtained at the office of the Borough Surveyor, J. C. Gordon, Aldeburgh, or at the offices of the Engineers, J. Mansergh and Sons, 5, Victoria Street, Westminster, on deposit of £2 2s. Tenders to be delivered to Henry C. Casley, Town Clerk, Aldeburgh.

Nov. 25. **RAINHILL, LANCS.**—Erection of six cottages at the Asylum, for the Lancashire Asylums Board. Drawings may be inspected, and all information obtained at the Engineer's Office. Bills of quantities can be obtained on application to the Clerk, on deposit of £2 2s. (cash). Tenders to be delivered to Jas. Gornall, Clerk and Steward, Clerk's Office, Rainhill Asylum.

KOH-I-NOOR

TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES

Of Stationers Artists Colourmen Photographic Dealers &c

L. & C. HARDTMUTH, 12, Golden Lane, London, E.C.

L. & C. HARDTMUTH'S
KOH-I-NOOR PENCIL

Is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-i-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-i-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-i-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-i-Noor Pencils are 4d. each, and 3s. 6d. per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

Professional Tendering.

At a meeting of the Quantity Surveyors' Association held last Wednesday, Mr. H. T. A. Chidgey, the president, in supporting a vote of thanks to Mr. William Woodward, F.R.I.B.A., for his paper on "Quantities and the Quantity Surveyor from the Architect's Point of View," referred to the question of tendering for quantities. There is, he admitted, no objection to the mere fact of tendering *per se.* "Our friends the builders," he said, "are tendering all day and every day," and it cannot be accounted to them for a crime. But, clearly, the builder, dealing with such a large number and variety of conditions, has fairly free scope for making his price pay. That he does not always succeed in this object is as lamentable as true. The case of the quantity surveyor, however, is very different. If, having secured the work at a low tender, he is to make it pay, he can only do it at the expense of the client. "It means this," said Mr. Chidgey, "that if a man who is tendering for quantities puts in, as so many men have put in, ridiculously low prices, he cannot give the work which a client is entitled to expect when he asks for a bill of quantities." Tendering, in any form, udoubtedly lends itself with peculiar facility to many abuses. On the other hand, in the case of a trade like building, it is not without its advantages. It ensures, for instance, a much wider distribution of the general volume of work. In the main, however, it is the client who reaps most benefit from the system, and that is the reason why he is endeavouring to extend it to all and sundry. He is trying to apply it to architects, and having been, unfortunately, rather successful in that direction, he is keen on bringing quantity surveyors under the yoke. He does not see, or he wilfully ignores, the fundamental difference between the case of the professional man and that of the tradesman. The latter, as we have said or implied, has to deal with a large number of data which allow of diversity in the handling. With the former, the circumstances are less variable and less elastic. The professional man has had a costly education and training, and is entitled to expect a fair return on the outlay. His services are professional and personal, and their value has been as fairly as possible assessed by the consensus of those who are best qualified to judge of it. That value cannot be depreciated without prejudice to the best interests of both the client and the professions, and therefore the professions are fully justified in making the strongest possible stand against a system that, if it is allowed to become general, must result in all-round degradation. Now is the time to stamp it out, and this can only be achieved by organised effort. The organisations exist. All that is necessary is to accord them loyal and hearty support. The good men still remaining outside those organisations are no doubt numerous. The present crisis affords a further striking illustration of the folly of holding aloof. Surely they must realise that their isolation, however "splendid," greatly weakens their own position and that of the organisations which are fighting their battles. If the professions were solid for the maintenance of their dignity and the assertion of their rights, their just demands would be irresistible; but there must be firmer discipline—an observation that applies more pointedly to the R.I.B.A. than to the Quantity Surveyors' Association, which, we understand, does not allow members to break the rules with impunity.

The Style of the Future.

Within the past few days the newspapers have given up much space to the wild sayings of the Futurists. Mr. Andrew Lang (who had only heard of them the day before writing his column of pleasant raillery in the "Morning Post") declares that most of their ideals were all anticipated at the dawn of civilisation, and the remainder soon afterwards. Whether the Futurists have yet invaded the domain of architecture we are not informed; but they have at least given a catchword to a journalist reporting a lecture on architecture which was delivered by Mr. F. M. Simpson, F.R.I.B.A., to the Sheffield Society of Architects. The heading to the report is "Improved Architecture. Sheffield Lecturer on the Style of the Future." Any assurance that Professor Simpson said nothing to justify this absurd label is unnecessary. He dealt mainly with the past, stating that the end of the eighteenth century was an age of shattered traditions, the first half of the nineteenth century was an age of archæological revivals, the middle period seeing the cult of so-called Queen Anne, and the last quarter being remarkable for a notable advance in civic architecture. He did not (if we may be pardoned the Stock Exchange jargon) speculate heavily in futures. He merely said that "there was now, he thought, every chance that the twentieth century might possess what the nineteenth never attained to, a recognised vernacular style, based on tradition, but not fettered by it, and original without being eccentric." That is not prophecy. If it is in any respect a forecast, it is akin to the intelligent anticipations of the official meteorological experts, who simply predict the weather that is seen to be coming along. We rather like the idea of a distinctive twentieth-century style, and trust that no sudden change in the wind may falsify the pleasant prognostication: a fearsome word, but not contradictory of our contention, because it seems to imply knowledge of existing phenomena, and logical and legitimate deduction therefrom; which is all that Professor Simpson attempted, he being much too wise and prudent to predict anything that is not in sight.

A Question of Values.

It is with mixed feelings that one notes the success of the strenuous endeavour that was made to keep Holbein's "Duchess of Milan" in this country. It is impossible not to admire the faith, pluck, and energy of the band of art enthusiasts who have, against all probability, secured this result; and as for the generosity of the unnamed contributor of the trifling item of £40,000 sterling towards the £70,000 demanded as the ransom of this bit of painted canvas, that is so stupendous as to seem well-nigh incredible. The Unity of Art being indisputable, our special interest in the Mistress Art being manifest, and the incident being so heroically magnificent and munificent, we hardly like to insinuate a lurking doubt as to whether the money could not have been more worthily spent. Paint and canvas, no matter how cunningly combined, nor by what transcendent genius of the brush, is, after all, to be judged by its power, and the duration and extent of that power, of giving enjoyment—a poor word that is here meant to connote a good deal more than it expresses; and we must confess that we are in thorough agreement with the remark made by Mr. Ernest George, in his Presidential address to the Royal Institute of British Architects, to the effect that the art of the architect, and the width of the appeal and the enduring character of noble buildings, are as yet comparatively unappreciated. Is it not strange, and well-nigh unaccountable, that the cloistered virtue of a painted picture should be so much more highly esteemed as a "thing of beauty," and—to complete the echo of Ruskin—should command so disproportionately high a "price in the market," as compared with the building that, more protecting than protected, delivers its mute message in the open air, and influences all its surroundings and every passer-by? Perhaps the fact that such vast sums are lavished on one form of art is encouraging to the others; but it would seem that in this, as in other matters, the public is addicted to concentrating itself on one idea at a time. But is it not nearly the turn of Architecture to become the prime favourite?—or, at all events, to be esteemed at something like its relative value to the community, if not to the connoisseur? We recognise the fallacy of comparing unlike things; but we nevertheless maintain that too much wealth is being lavished on Old Masters, and too little on modern architecture.

Mediæval Sham and Shoddy. The "audacity, and even recklessness," of mediæval builders is commented upon by a leader writer in the "Times" with reference to the discoveries that have been made by Mr. W. D. Caröe at Canterbury Cathedral. Professor Willis and Mr. Caröe, with fine prescience, imagined that the supporting piers of the central tower possibly encased the original Norman piers of Lanfranc's building. It is now proved that the present piers are merely shells, less than a foot thick. The space between this shell and the Norman piers is filled with rubble, which "seems to be separated from the Norman piers by a clear space about half an inch wide, as though a wooden core had been purposely used round the old pier and withdrawn as the new work went up." There is some reason to suppose that the disguising, or, rather, concealment, of the earlier styles is not uncommon, for "the Gothic builders seem to have had a positive distaste for Norman building, just as we have a distaste for clothes and other things that have lately gone out of fashion. Whenever they could, they destroyed Norman work, as in the naves of Canterbury and Winchester. Indeed, the changes in mediæval architecture were often as sudden and violent as modern changes of fashion." Perhaps Gloucester is a case in point, although here the disguise is extraordinarily incomplete; for while the exterior is rather pronounced Gothic, the inside, with its massive rounded pillars, is more than suggestive of Norman, so that, on entering the cathedral, the stranger, and even the habituê who has any sense of style, receives a rather severe shock. The surprise, however, is rather less disconcerting than that which arises from Mr. Caröe's discovery at Canterbury, for the fair inference is that, although the mediæval men may have "builded better than they knew," they builded rather worse than we had suspected. Mr. Caröe says that their engineering skill and daring were by no means contemptible; but his adjective seems to suggest itself as being very appropriate to their methods, or at least to their shams and subterfuges; and the revelations at Canterbury and Winchester do not reassure us as to their engineering skill. But there is no question about their daring, which, like most examples of reckless audacity, was largely the outcome of ignorance. Their "engineering skill," although perhaps not contemptible, was extremely superficial, as the custodians of our old cathedrals will ruefully admit.

The Committee of the Royal Sanitary Institute (90, Buckingham Palace Road, S.W.) are arranging for short exhibitions of sanitary apparatus, the first of which, opened from November 10th till the end of January, 1910, comprises working models of sewage distributors and sprinklers, shown in action. It is announced that the Council have accepted an invitation from the Town Council of Brighton to hold the next Congress and exhibition of the Institute in Brighton during the first two weeks of September, 1910.

Correspondence.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

Reinforced Concrete Systems.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We noticed that in your issue of November 10th, in your article of Reinforced Concrete Systems, you are publishing a section of a floor which is an infringement of our patent No. 25301/05, namely, Fig. 12, on page 336. Messrs. Leslie and Co., Ltd., who have published this in your paper, hold no license from us to use this floor, in respect of which we are the patentees. We must therefore request that you will be good enough to insert this letter in your paper in order that it may be known that we are prepared to take action to protect our rights against the manufacture of this floor without our license.

Yours faithfully,
UNITED KINGDOM FIRE-PROOFING CO., LTD.,
GEO. H. GASCOIGNE,
Managing Director.

Architectural Competitions.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I write with reference to your article on "The Moral of Middlesbrough," because I think you draw a wrong and a dangerous moral, and your reasoning is a tacit encouragement of what is the greatest evil which exists in these matters, the loose and slipshop way in which the system is worked.

As to the particular competition in question, the writer, with others, competed; with others regarded the conditions as in many ways absurd, but with others when they were insisted upon and reiterated in the replies to queries, conformed to them. As a matter of fact the writer threw away a plan which was almost line for line with that given the first place, because it clearly violated conditions which were reiterated. The writer did not join in the protest, as he was clear on the legal aspect of the question, and also knew it was not one of the best cases to protest about, as there were absolute advantages in favour of a design which violated the conditions laid down. Logically it does not matter in the least if such is the case, but experience shows that architects are not among the most logical of mankind.

It is perfectly true, as you say, that public bodies do not hold competitions in order to give prizes to architects, but it is equally true that the inducement they offer to architects is that in return for a number of men giving them the right to choose between a large number of designs, the public body binds itself to carry out more or less clear regulations in making its decision. Mr. C. A. Russell rightly says, "the only effectual protection of competitors is the competence and fairness of the assessor. When competitors have definite and binding conditions laid down for them, it is unfair to disregard such conditions. It is giving to A, who has given what you have bound yourself not to take, what belongs to B, who has unfortunately believed your clearly-stated intention. It overlooks the fact that B may be, and very likely is, quite as competent to give you what you want as A—that B, in fact, can give you the arrangement you now know you would like to have in actual fact. By adopting a design you do not pledge yourself to build it without alteration or amendment, while you have pledged yourself to give your award within certain conditions. Moreover, it is far easier to break than to keep conditions.

Assessors too frequently act as if it were theirs to express opinion, and not to act as the recorders of justice. Again, within the lines of the conditions, there is in very many cases only one possible winner, who would be the winner were the competition impartially assessed by almost any competent man. Outside the conditions you are in a desert of opinion, and six competent judges may have reason to come to six different solutions. While the award which is based on facts cannot be cavilled at, as it is fair, that based on opinion, however fair, will always be open to question.

The root of the matter seems to be that among architects there are very few men who have the judicial and logical instinct. Possibly they try to do too much. Their function should be, firstly, secondly and thirdly, "to determine which of the designs conform to the conditions"; and if they do this, they have not a whole field but a single furrow in it to examine. Any gifted man might fail in the first, any competent man should succeed in the second case.

If conditions of a binding character fetter genius, it is easy to do away with them; though many of us would not care for the open lottery which would then remain; but we should have the option of taking it or leaving it.

"EXPERIENCE."

[Our correspondent's letter has been slightly modified in one or two places, without affecting his contention. We certainly cannot agree that it is the whole duty of assessors "to determine which of the designs conform to the conditions." If the conditions are bad, and defeat the object, it is perhaps the duty of the assessor to exercise his judgment in the choice. But we are always in full sympathy with the victims of ill-drawn conditions, and we feel that it would be more advantageous to insist on the proper drawing-up of conditions than to chop logic as to how, being bad or ambiguous, they should be interpreted.—Ed.]

At the meeting of the Architectural Association held on Friday, November 5th, the following elections were announced:—C. Grellier, Epsom; E. K. Rowe, Westcliffe-on-Sea; H. M. Whitehead, Brentford, W.; A. B. L. Roberts, Chelsea, S.W.; R. Williams, Clifford's Inn, E.C.; R. S. Cobb, Shortlands, Kent; N. A. Walton, Stockwell, S.W.; J. Basevi, Stockwell, S.W.; W. S. Peto, Stockwell, S.W.; Hon. L. J. Fiennes, Reading.

* * *

Mr. W. D. Caröe's statement in "The Times" that the Norman piers supporting the Angel Steeple, Canterbury Cathedral, were cased in by later work, and that the rubble filling between the casing and the contained piers was separated from the Norman work by a clear space about half-an-inch wide, "as though a wooden core had been purposely used round the old pier and withdrawn as the new work went up," is opposed by Mr. W. H. St. John Hope, who attributes this curious arrangement to the early buckling of the piers. Mr. Hope also holds that the casing was carried out in Chillingden's time, and not in that of Archbishop Chicheley.

* * *

Mr. A. C. Benson's recent article in the "Church Family Newspaper" on the Right Principles of Church Restoration to which we have recently referred, continues to attract considerable correspondence. In a recent issue of our contemporary, Mr. Jethro A. Cossins, architect, of Birmingham, draws attention to many of the enormities of the "restorers;" the old stone pavements, often largely composed of gravestones with inscriptions, which are taken up to make way for hard tile pavements, the nailing of old brasses to walls in spite of the "hic jacet" of their inscriptions; the pitchpine woodwork which replaces old oak; the stripping of plaster from the walls and treatment of the stone surface with ridged lines of black mortar; the "dragging" or tooling of all old freestone details; the filling of the windows with cathedral glass. Mr. George Jack, also a supporter of Mr. Benson's views, recommends the procedure of the "Society for the Preservation of Ancient Buildings," and points out the necessity for the architect devoting his whole time and attention to the work.

LEITH'S GERMAN-MADE SCHOOLS.

Strong Protest by Edinburgh and Leith Builders.

A special joint meeting of the Edinburgh, Leith and District Building Trades Association, and the Building Trades Exchange of the City and District of Edinburgh, was held in the Exchange Board-room, 61, Lothian Road, Edinburgh, on Wednesday evening, November 3rd. The circular calling the meeting states that "it appears that some time ago the Leith School Board decided to have two schools built on the Doeker principle, and sent the order direct to Germany without asking the local (or even British) builders to tender for the work. The whole question is one that affects the Edinburgh and Leith building trade in general, and those members of the trade who are ratepayers in the Burgh of Leith in particular. Over and above, there is a question of principle involved. A meeting of the trade is therefore hereby called to consider the whole matter, and to take such steps as may be deemed proper and expedient."

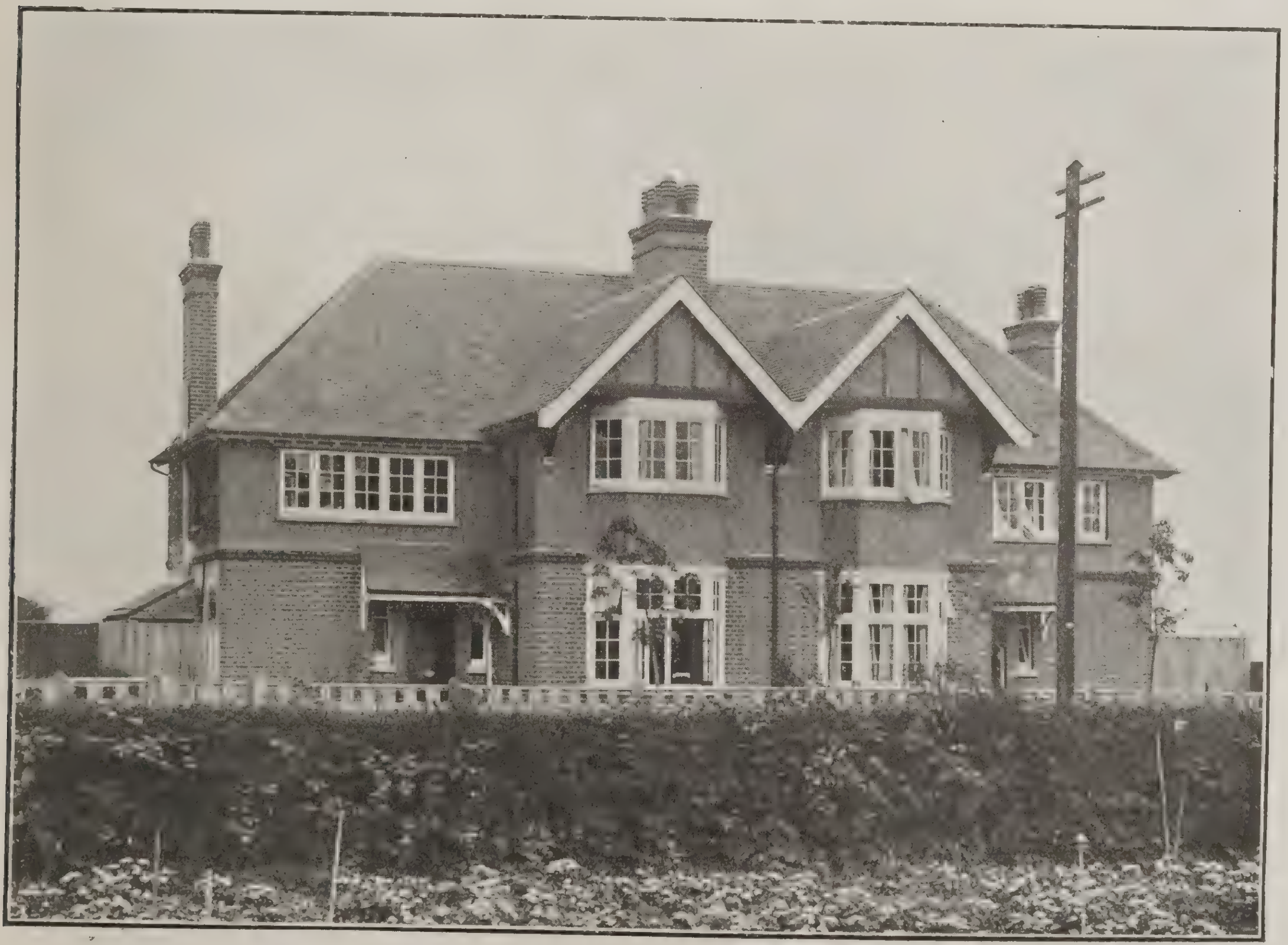
Mr. W. Graham-Yooll, chairman of the Building Trades Exchange, presided over a representative gathering. At the outset he stated that the political aspect would not enter into the discussion. The two schools which the Leith School Board were going to erect each accommodated 480 scholars, and together would cost from £13,000 to £14,000. An ordinary permanent school erection would cost between £10 and £12 per scholar, and the Scottish Education Department limited the expenditure to that sum. The new schools, however, would, he believed, exceed that cost, despite the fact that they were only erections of a temporary character. Moreover, they were not even movable in the ordinary sense of the word, because they had permanent foundations and a permanent roof; it was only the walls that could be taken to pieces and removed. For what reason had the Leith Board gone abroad? He did not think anyone present could answer that question. They had not gone for economy, the speaker contended. It seemed to him absurd that the Board should have gone abroad for these buildings when they could have been erected more cheaply by British contractors, more especially when there was such a great deal of stagnation in the trade. The Board was, in fact, going in for the feeding of school children, while at the same time they were depriving the parents of the means of keeping their bodies and souls together. The foundations of the buildings, he might mention, would be put in by local firms, but the construction would be supervised by Germans. There was absolutely no valid reason for the Board's action, and he thought that they, as a trade, should enter a very strong protest.

Mr. Mekie, chairman of the Master Builders' Association, stated that 40 per cent. of the money to be employed on the buildings was going abroad, which represented a very large sum to be spent in a foreign country, when it could have been spent to a better advantage at home, and benefited artisans sorely in need of work.

Mr. J. R. Watson said that the same kind of buildings could have been erected by British workmen, and it seemed that if Leith School Board were going to indulge in schemes of this kind, the Government should make them pay for the privilege. There was nothing difficult in the building construction; in fact, similar buildings were put up daily excepting the fact that the walls were not lined with the Doeker material.

Mr. W. Melrose, builder, Leith, thought that the bricks to be utilised for the floors might have been sufficient to build a school themselves. He stated that the boundary walls are to be of finely dressed rubble work on both sides, with about 1,000 ft. of dressed cope. There were also several hundred brick piers to carry the floors, and the cost of these items alone would amount to about £2,000. He went on to say that the schools were bought some time ago, and he was surprised that the Board had succeeded in getting the scheme passed by the Leith Dean of Guild Court.

Councillor A. A. Murray afterwards moved the following resolution, namely: "That this meeting of the Edinburgh, Leith and District Building Trades Association, and the Building Trades Exchange of the City and District of Edinburgh, protests against the action of the Leith School Board in going abroad for any contracts for the erection of the two schools presently being erected for them, without giving local (or even British) contractors an opportunity of tendering for same. It is further of opinion that such action is detrimental generally to the interests of the building trades in the Edinburgh and Leith district, and of the ratepayers in particular, as the cost is believed to be greater than that at which they could have obtained ordinary permanent buildings. This meeting further resolves to send copies of this protest to the Leith School Board, and to the Scotch Education Department." In moving the resolution, Councillor Murray said that it seemed absolute nonsense for distress committees to be organised and then wages to such a large sum sent out of the country, and the ratepayers paying the piper all the time. It was a very grave matter for those interested in the building trades, and the Board's action had been most unfortunate. It was absolutely undreamt of that any German material should come across the water for a school for even temporary purposes. He failed to un-



COTTAGES ON THE NORTH FELTHAM ESTATE, FELTHAM, MIDDLESEX. ALBERT C. NOTLEY, ARCHITECT.

These cottages are faced with red bricks up to the string course, and above this the walls are rough-casted. The roofs are covered with sand-faced tiles and the internal partitions are brick built throughout.

derstand how the scheme had ever been passed by the department. He thought that the meeting had made out a good case for protest against the action of the Leith School Board. He wanted to know why the School Board had gone abroad at all. It could not be because of hurry, as local builders could have put up permanent buildings in as quick a time. The Board, he thought, had jumped to the conclusion to have these brand-new made-in-Germany buildings put down in Leith without considering the local tradesmen or local contractors.

Mr. J. R. Watson, Leith, seconded the resolution, which was carried unanimously.

The staff annual dinner of the Expanded Metal Company, Ltd., was held on Friday evening last, at the York Restaurant. Mr. Fredk. Purton, the manager of the company, presided over a large gathering of the staff, and among the guests were Mr. R. R. Walker, Mr. Chalmers, and Mr. Fruen, of Messrs. Wm. Jacks and Co., Mr. Hughes, of Messrs. A. G. Kidston and Co., and Mr. Cranmer. An interesting musical programme was provided by Messrs. Purton, Jenkins, Holt, and Cranmer, while the humorous element was well represented by two talented junior members of the staff, Messrs. Rowley and Ferneyhough.

* * *

An interesting archæological collection belonging to Mr. John Ford, Deputy Lieutenant of the County of Middlesex, was offered for sale on November 16th, at Old Park, Enfield, by Messrs. Knight, Frank and Rutley. The house is one of the few fine specimens remaining near London of the Queen Anne period, and the owner, who is a well-known Fellow of the Society of Antiquaries, has, during a long career, collected the specimens which are about to be dispersed. The gardens at Old Park contain some ancient life-sized lead figures and marble vases such as are rarely found, except in the pleasaunce of a great mansion like Chatsworth or Trentham. Stone ornaments, designed by Sir Christopher Wren, and removed from two of his famous City churches, are to be found here, and palisading from the Old South Sea House, rare old iron gates and marble vases from the old palace at Theobalds Park, a sundial formerly belonging to Sir Hugh Myddelton, and stonework originally on Burlington House, Piccadilly. Old English silver and pewter, porcelain of the various Chinese dynasties, Greek and Roman glass and pottery, rare Persian rugs, and furniture by the old English cabinet-makers from Charles II. down to the time of the Georges, were included in the sale.

ELECTRICITY IN BUILDINGS.
VII.

By Harold Hastings, M.I.E.E., A.M.Inst., C.E.

(Concluded from page 568, No. 749).

Typical Installation Work.

We have put before our readers the theoretical consideration of electricity; the nature of an electric current; the apparatus required for transmitting it in any desired course; and the means of utilising it when it has been conveyed to the required spot.

We have, therefore, all the materials for building up a concrete case. Let us assume a fairly simple example, prepare a schedule of quantities, and proceed to discuss each portion of the work in detail. The plan shall be as shown in Fig. 33, and we will treat it in the alternative ways suggested in the preceding articles.

Before starting to take measurements there are three things to do—(1) call upon the Supply Co. to fix their point of entry and to indicate the positions of their main cut-out and meter (they have the right to choose any reasonable position that they may think fit); (2) fix the position of the distribution-board; (3) make a list of the requirements, taking notes of the apparatus wanted in each room and marking the positions of lamps, switches, etc., on a plan after the style of that to be given later.

The Supply Co.'s main cut-out forms the line of demarcation between the internal wiring and the external cable. The wiring contractor has to provide everything from this point inwards except the meter, and he has to furnish the cables for connecting to the meter.

The order of apparatus at the entrance is, Supply Co.'s main cut-out, meter, consumer's main switch, consumer's single-pole main cut-outs. Thence the cables go direct to the distribution-board from which the circuits radiate. If the tree system is employed the cables run from the consumer's main cut-outs straight up the building.

In the case under consideration, we have assumed the point of entry to be in the front of the house, facing the cellar stairs. The cable turns horizontally towards the wine cellar and immediately enters the Supply Co.'s main cut-out. The meter is placed a foot nearer the wine cellar. The height of the cables is 3ft. below the ceiling.

It will be found that the Supply Co.'s men will come and lay the service to the point determined, shortly after the first visit. They will fix the cut-out and connect their cable into it. They will then leave the cut-out sealed up until advised that the installation is nearly completed. The meter will most probably be fixed a day or two before the contractor is ready for current to be switched on. Finally, they will come and unseal the cut-out and then connect the contractor's wires into it.

Before giving a supply they test the installation with all lamps and other apparatus in position, both between poles and from each pole to earth. The engineer examines the whole installation from top to bottom to see that it has been carried out in accordance with the company's requirements.

The contractor can find out exactly what these requirements are before starting the work by applying for a book of rules. Every precaution must be taken to ensure a satisfactory test before the engineer is asked to come. Companies make a point of charging for each test after the first (which is always free). The usual charge is 10s. 6d. But apart from the monetary consideration it is very unpleasant to have to explain to the would-be consumer why he is unable to consume.

The most convenient spot for the distribution-board appears to be the corner in the hall, outside the housemaid's pantry. It will be fixed 5ft. from the floor level as this is a suitable height for manipulating the fuses.

The best way to make a list of requirements is to begin at the top of the house and make very full notes regarding each room as given below. At the same time the walls should be marked, and a small cross pencilled or chalked on them to indicate the position of the switches, brackets, etc.

Bedroom No. 1.—A 3-light pendant will be placed in the centre of the room, with 2 switches at the door. Two counter-weight pendants are wanted by the dressing-table, controlled by one switch close at hand. A wall-plug will go at the side of the bed, for a reading-lamp, and another by the fireplace, for a curling-iron heater or other accessory. We can assume the two wall-plugs to be 16 c.p. each, and the rest of the lamps 8 c.p.

Bedroom No. 2.—Two plain pendants are sufficient for this room, with one controlled from the door and the other from the side of the bed. Both will have 8 c.p. lamps.

Boxroom.—One plain 8 c.p. pendant, with the switch by the door.

Bedroom No. 3.—Two plain 8 c.p. pendants, with one switch at the door and one near the bed.

Bedroom No. 4.—One bracket lamp near the bed, with a switch underneath it, and one pendant lamp over the dressing-table, with the switch at the door. Both of these 8 c.p.

Landing and Stairs.—One 8 c.p. pendant is required over the stairs, with two 2-way switches controlling it, wired so that it can be lighted from the bottom of the stairs, or from the top. This completes the second floor.

Bedroom No. 5.—Another three-light pendant will be suitable here, with two switches. Four wall-plugs for a nominal 16 c.p. each will prove adaptable for table lamps or brackets fitted to hang from the picture moulding.

Dressing-room.—Two 8 c.p. pendants, with one switch at each door, and a wall-plug (16 c.p.) will satisfy this room.

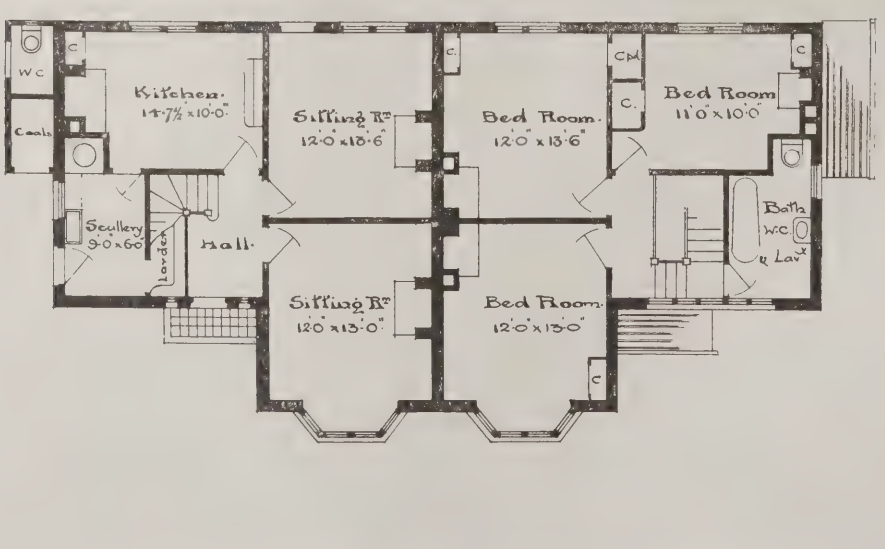
Bathroom.—One pendant for 8 c.p. should be placed over the bath and a wall-plug for a radiator (say 16 c.p. for the present).

Water-closet.—One 8 c.p. pendant with the switch at the door.

Bedroom No. 6.—Two three-light fittings and four wall-plugs will illuminate this room well. The wall-plugs will be reckoned as 16 c.p. and the other lamps as 8 c.p. The switches for the fittings will be placed for one at the doorway, and for the other close at hand. They will have two switches each.

Dressing-room.—Two pendants and one wall-plug will be enough, arranged as in the other dressing-room.

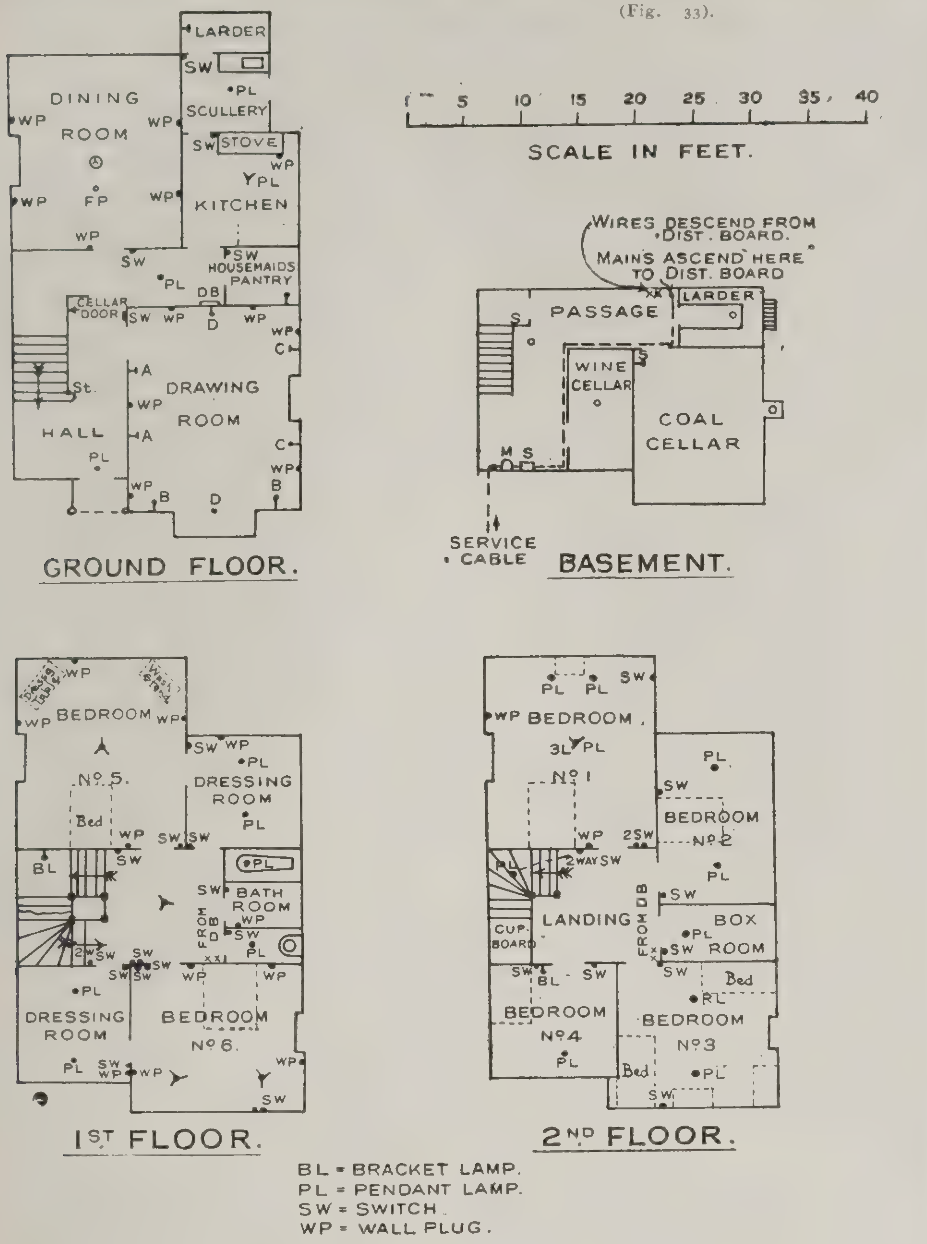
Landing.—One three-light 8 c.p. fitting with two switches.



Ground Floor Plan. First Floor Plan.

COTTAGES, NORTH FELTHAM ESTATE, FELTHAM, MIDDLESEX. ALBERT C. NOTLEY, ARCHITECT.
The cost including fencing, gates, gardens and all other expenses worked out at 6d. per foot cube.
Mr. A. Emmett was the builder.

(Fig. 33).



Stairs.—A bracket at the corner with two 2-way switches will be ample, but in this case a 16 c.p. should be used.

Dining-room.—In this room a counterweight fitting for three lights is required over the table. This will have a heavy shade and can concentrate its light on the table. Around the room five wall-plugs can be placed, to which standard lamps can be connected, should the room at any time be used as a supper-room for a dance. A floor-plug should be let in, level with the floor and under the table, for making connection to table lamps. The two switches for the centre fitting should be near the door, arranged to light one lamp with one switch and two with the other. The floor-plug should also be controlled by a switch. It may be found convenient to place these three switches just outside the door in the hall.

Kitchen.—A three-light counterweight fitting with two switches at the doorway, will be placed over the table. In addition to this, a wall-plug by the side of the stove will be found very handy. A hand-lamp can be attached to this, to enable the cook to examine things in the oven without the necessity of pulling them out into the light.

Scullery.—One lamp should suffice, with the switch at the kitchen door.

Larder.—One bracket can be placed here, with a switch underneath.

Housemaid's Pantry.—One bracket and switch is enough.

Drawing-room.—In this case we have placed 7 brackets round the room and one pendant in the bay-window, also there are 6 wall-plugs. The last are most useful in a drawing-room as they will be found very convenient for connecting standard lamps. It will be as well to assume that all the points in this room are to have 16 c.p. lamps. The switches can be neatly arranged outside the door in the hall. One switch should control a pair of lamps, and they can be arranged so that the lamps marked AA, BB, CC, DD can be lighted together.

Hall.—A newel standard is very effective, having a switch at its base. A pendant over the door and another round the corner should suffice. All these should be 16 c.p. lamps.

Cellars.—A switch at the top of the cellar stairs is most necessary. It can control a lamp placed at the corner of the passage close up to the ceiling. This will light the stairs and the passage in each direction. Lamps are also placed in the wine cellar, coal cellar, and the larder, with their switches at the doors of each place.

These notes can now be summarised in the form of table G, see p. 378.

The next thing to do is to divide the system into circuits. The fuses in a distribution-board are supposed to carry about five amperes, but it is wiser to keep well below this to allow for small additions and for changing some of the 8 c.p. lamps for 16 c.p. as occasion demands. We will, therefore, try to approximate 4 amperes on each circuit.

The lamps are first divided into floors, remembering that pendants are wired from the floor above and wall-plugs from one on which the room in which they are placed is situate. For example, the wall-plugs in bedroom No. 1 will be wired from the same circuit as the three-light pendant in bedroom No. 5.

It is seen that the whole installation involves an equivalent to 123·8 c.p. lamps. If these are taken at 33 watts per lamp they represent 4,059 watts. As the system is assumed to be a 200-volt one, the watts divided by 200 will give the amperes, 4,059 divided by 200 equals 20.3 nearly.

As we are arranging to supply 3 to 4 amperes on each circuit and the total is 20.3, there will be 5 or 6 circuits. Assuming that the greater number is correct, as it is easy afterwards to combine two circuits under one fuse, we can prepare a second schedule showing which lamps are connected to each circuit.

It is unnecessary to make a diagram of the wiring of each part of the house. The system to be followed is a very simple one. The two wires, which emanate from the distribution-board, may be distinguished by the terms "switch-wire" and "lamp-wire." It is a rule in all installation work that all the switches shall be connected to the same pole. This rule indicates the system to be followed. The system is, first, that all the switches are to be connected together by looping the wire in and out of one terminal and then on to the next lamp. Second, the remaining terminal of each switch is to be connected to the lamp, or lamps, that it is to control. Third, the lamp wire is to be connected to all lamps by looping in and out of the free terminals.

It is not important to make these connections in rotation, but they may be made as is most convenient; that is, if the switch-wire from the distribution-board is first taken to the bathroom switch, it is not necessary to take the lamp wire to the bathroom lamp first, it may go to the other end of the circuit if more convenient.

When a switch controls more than one lamp the others are coupled to the first in parallel. Coupling in parallel has already been explained in the first section. It consists of joining together the terminals.

Wall-plugs which are not controlled by a switch are treated both as lamps and switches, that is, the lamp-wire diverts into it, as it passes from lamp to lamp, and the switch-wire does the same, as it, too, passes from switch to switch. By wiring on this method it is quite unnecessary to have any joints at all. But it must be remembered that looping consists only of taking a wire into and out of the same terminal. If once the looped wire is taken into one terminal and out of the other the whole system will be upset.

The size of the wires must next engage our attention. Taking the switch-wire first, it is clear that the length between the board and A, has to carry the current of the whole circuit. The length AB has one lamp less. The length BC carries current for three lamps less than the total number. Thus, we can proceed through the whole circuit. Theoretically, we could make a reduction in the size of wire each time a branch is taken off, but these would be in such infinitesimal steps, that it would be quite impractical. In the case in point, assuming that all the lamps and plugs are 8 c.p. at 200 volts, the total watts are 350, so the total amperes are 350 divided 200 equal 1.7 amperes. A single 18 wire will carry this easily. But supposing there is a restriction that the drop may not exceed 3 volts and that the distance from the board to A is 100yds., then the drop on a No. 18 would be nearly 5 volts, because there would be 200yds. of wire, and it is loaded up to nearly 1,000 amperes per sq. in. A single No. 16, therefore, would have to be used, and as the loss would be 5 volts in 200yds. of wire with

	Multiply by 33 to find wt. =	594	462	924	858	792	429
	Divide by 200 to find amps. =	2.97	2.31	4.62	4.29	3.96	2.145

3.18 amperes, with 1.75 amperes it will be less, in strict proportion, thus—5 × 1.75 ÷ 3.18 = 2.75 volts.

The wires which connect the switches to the lamps which they control, have only to carry the current necessary for the lamps in question.

Now that the principle has been fully explained we can apply it to the installation which we have assumed.

Circuit No. 1 has at total current of 2.145 amperes, so that a No. 18 will carry the current easily. As this is the smallest size of wire which it is advisable to use, the whole circuit will be wired with this size. The run of the wires is a direct one from the board to the first switch and lamp. It will be, say, 7ft. to the ceiling of the ground floor, 11ft. to the ceiling of the first floor, and 9ft. to the ceiling of the second floor; thence 6ft. to the nearest switch and lamp, making a total distance of 33ft., or 11yds. As there are two wires, their total length will be 22yds. By simple proportion we can find the drop in volts, for it is known that 100yds. of No. 18 wire gives a drop of 2.5 volts with 1.8 amperes, so that 22yds. will give .25 drop and 22yds. with 2.145 amperes will give a drop of .66 volts, which is very moderate.

By scaling from the plan the distances from lamp to lamp, and from switch to switch, and allowing for a loop at each switch to within 4ft. from the floor level, we find that a total length of 50yds. of switch wires, 30yds. of lamp-wires, and 46yds. of wires between the switches and the lamps is required. This makes a total length of wire on the top floor of 126yds. The maximum drop on the circuit may be taken as half the greatest distance from the first lamp and switch to the farthest, and due to half the number of lamps connected along this distance. If the lamps were tapped off at equal intervals the result would be theoretically correct. The method, therefore, is sufficiently approximate for all practical purposes.

In the present case the greatest distance is from the boxroom to the bedroom No. 1, and amounts, when measured on the plan, to 34yds., allowing as before for the loops to the switches. Half this distance with two wires will still give 34yds. of wire. There are 8 lamps connected to this run, so that the drop will be taken on 4.

Four lamps take .7 amperes, and the drop on a No. 18 in 34yds. will be .33 volts. This amount added to the drop in the leads from the distribution-board to the first lamp and switch, namely, .66, gives a maximum drop of, say, 1 volt, which is very low.

The other floors can be dealt with in exactly the same manner, remembering that in these cases the wires not only descend to

the switches, but also rise to the wall-plugs of the floor above. It is scarcely necessary to do more than indicate the sizes of the wires in each case. They can be determined at sight.

Circuit Nos. 1, 5, and 6 need single No. 18 throughout, and the other three No. 16 as far as the first switch and lamp, and No. 18 elsewhere. The main cable entering the house will have to be of 7-16 strand.

As two wires go in the casing or tubing in nearly all the runs, the quantity required can be safely assumed to be 20 per cent. more than half the length of each size of wire. The casing must, of course, be of the size suitable for the wire in question, and can be determined from the tables already given.

The quantity of wire will be 38yds. of No. 16 and 684yds. of No. 18, as shown on the following table:—

TABLE H.

	From distribution board to first switch and lamp.	Wire connecting all switches.	Wire connecting all lamps.	Wires between switches and lamps.	Totals.	
					No. 16	No. 18
Circuit I ..	22	50	30	46	—	148
,, II ..	16*	65	30	70	16	165
,, III..	8*	40	30	44	8	114
,, IV ..	14*	—	32	74	14	120
,, V ..	12	22	22	All WP	—	56
,, VI ..	8	28	39	6	—	81
*These are No. 16 guage.					38	684

It is now a simple matter to summarise the various tables in the form of a schedule of quantities, as follows:—

Schedule of Quantities.

1	25-amp. main double-pole switch in lock-up case.
2	single-pole main cut-outs, for 25 amperes.
1	six-way distribution board, 5 amperes per way.
26	yds. $\frac{7}{16}$s. Association, 600 meg. grade 200-volt cable.
13	yds. $2\frac{3}{4}$in. wide wood casing or $1\frac{1}{4}$in. heavy gauge brazed and screwed steel tubing.
648	yds. No. 18 Association 600 meg. grade wire.
38	yds. No. 16 do. do. do.
324	yds. $1\frac{1}{8}$in. wood casing or $\frac{5}{8}$in. steel tubing.
19	yds. $1\frac{1}{2}$in. wood casing or $\frac{1}{2}$in. steel tubing. (If tubing used include bends, elbows, inspection boxes, &c.)
156	yds. flexible cord, for pendants.
43	"Tumbler" switches.
4	2-way "Tumbler" switches.
30	ceiling roses.
58	round base blocks for roses and switches.
6	base blocks for two switches.
1	do. three do.
1	do. four do.
5	3-light pendant fittings with cord grips
2	counter-weight pendants for 1 lamp.
25	wall sockets and plugs.
1	floor plug.
2	counter-weight 3-light fittings -(p.c. price for 1).
1	Newel standard. (Allow p.c. price.)
7	1-light brackets, ornamental design. (Allow p.c. price).
4	plain brackets.
23	lamp-holders, with shade-rings and cord-grips bayonet socket, for 200-volt system.
33	lamp-holders, with shade-rings and bayonet socket, no cord-grips, but $\frac{1}{4}$in. thread.
41	8-c.p. lamps for bayonet socket.
41	16-c.p. do.
50	shades to choice. (Allow p.c. price.) Screws, jointing materials, &c.

If the tree system had been employed, the circuits would have been wired in the same manner. The whole installation would have been scheduled in the same way, with the following alterations:—

(1) The distribution board would have been replaced with six single pole 5 ampere cut-outs, mounted in pairs on base-boards.

(2) About 28yds. run of two single wires in casing or tubing would have been replaced by 8yds. run of two 7-16 cables in its corresponding casing or tubing.

(3) At least 4 joints would have been made in the 7-16 cable.

A small amount of money would have been saved on items (1) and (2), but item (3) more than counterbalances this, both as regards expense and also soundness of work. It is most desirable to avoid joints as far as possible.

As before pointed out, it is of great advantage to have all the fuses concentrated in one position, rather than scattered broadcast about the building.

We have now considered every detail of a typical installation, and the one we have taken is a very common type. There is very little more to say regarding any class of house-wiring that may present itself. The same line of action is followed. The most adaptable system is chosen, whether it be tree or distribution-board, casing or tubing, or even a mixture of each.

If the total amperes exceed an amount which the Supply Co.'s rules fix and which is usually 25 amperes, then the "three-wire system" is employed. In such a case the only difference is that two complete installations have to be made instead of one, and the fuses and other apparatus of each system must be kept at least 6ft. apart. The loop for the metre has to be left on one wire of each system, and the diagram of connections at the point of entrance will be as shown in the figure. The two halves of the installation should be balanced as far as possible, not only as regards their total current, but also with respect to the uses to which the lamps, etc., are put. For example, a dwelling-house should have an equal number of bedrooms connected to each side, so that in all probability the same number of lamps on each half of the wiring will be consuming current at the same time.

We have avoided discussing any but the most popular and less experimental systems of wiring. The object that we have held in view throughout this series of papers has been to give the reader a sound basis upon which to build the details of any installation which may come in his way. With the aid of these remarks he should be able to design and carry out installation work, or, if he does not wish to do so himself, he should be able to see that the work is done for him in a proper and workmanlike manner.

Coming Events.

Wednesday, November 17.

Northern Architectural Association, Newcastle.—Students' Meeting. Mr. J. G. Smith on "Portland Cement Manufacture and Testing," 7.30.

Thursday, November 18.

Illuminating Engineering Society.—Opening meeting, at the premises of the Royal Society of Arts, 18, John Street, Adelphi, London, W. Inaugural Address, by Prof. Silvanus P. Thompson, D.Sc., F.R.S.

Friday, November 19.

Architectural Association, 18, Tufton Street, Westminster.—Mr. C. Reginald Enock, F.R.G.S., on "Architecture of the Incas of Peru," 7.30 p.m.

Institution of Mechanical Engineers, Storey's Gate, Westminster. — Ordinary General Meeting. Mr. Herbert A. Humphrey on "An Internal Combustion Pump, and other Applications of a New Principle," 8 p.m.

Saturday, November 20.

Junior Institution of Engineers.—Visit to Foundation Works, London County Hall, Belvedere Road, Lambeth, S.E., 3 p.m.

Royal Sanitary Institute, 90, Buckingham Palace Road, S.W.—Discussion, at Exchange Buildings, Nottingham, on "The Improvement of City Slums by Housing Reform and Otherwise," opened by Alderman T. J. Babell. (Afterwards, Visits to Housing Reform areas.)

CONTRACTORS' TEMPORARY TACKLE.

By Hugh S. Cregeen, A.M.I.C.E., P.A.S.I.

The several useful expedients here described were employed on works with which the writer was connected.

In the repair of the brickwork of a railway tunnel which had become much decayed and unsafe, it became necessary to introduce new brickwork in many places, both in the sides and in the crown of the arch.

No particular difficulty was experienced with the side walls, which, with the aid of light trestles and planks, were necessarily within reach of the workmen. These trestles and planks could be easily removed on the approach of traffic, but the repair of the arch was a more difficult matter, and a staging had to be erected. This was constructed at a safe height above the traffic running beneath. In the brickwork, holes were cut sufficiently large for 12in. by 6in. timbers (or byats as they are called) to be inserted 4ft. apart centre to centre, on which 3in. planking was spiked, thus forming a platform for the men to work. On this stage, centering was fixed as shown in Fig. 1, and the brickwork was cut out and repaired in short lengths at a time.

Fig. 2 shows a cheap type of temporary covered way or passage, on the side of a

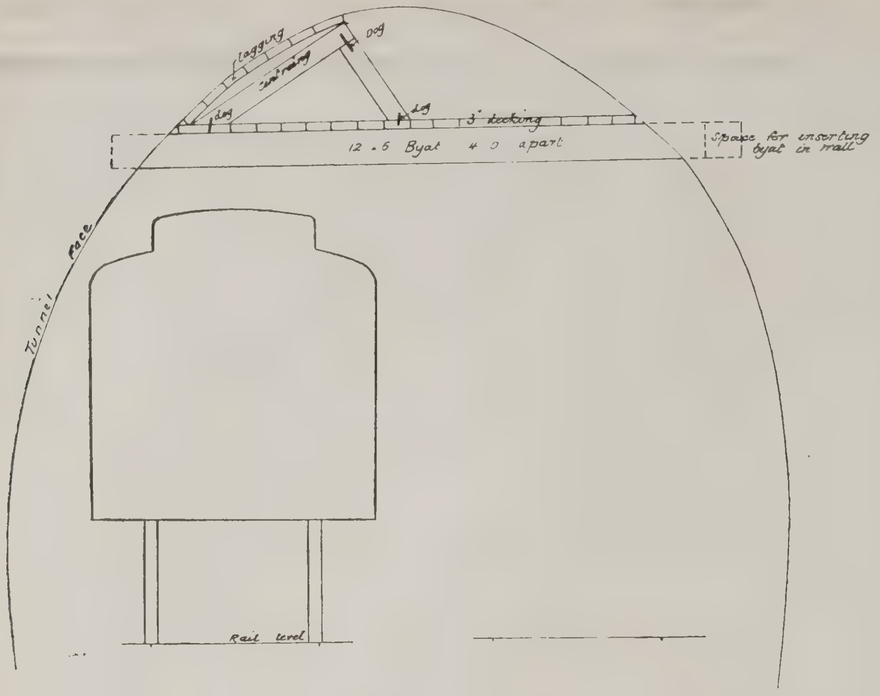

FIG 1.

REPAIRING BRICKWORK OF RAILWAY TUNNEL.

A platform for the workers was formed by placing in holes cut in the brickwork some 12 in. by 6 in. timbers, at 4 ft. centres, and spiking down 3 in, planking.

slope. It is constructed of old steel rail piles driven down into the solid ground, on which a curved portion, also made of rails, is bolted. These are fixed every 9ft. apart, and rail longitudinals connect them together and stiffen the structure.

The roof is formed of corrugated iron, while timber lagging fills in the sides as shown.

Fig 3 illustrates the timbering required in the process of carrying a sewer or large water pipe under the lines of a railway by means of trench work. Two whole timbers, 20ft. in length, are placed under the rails on 12in. × 12in. sole pieces, to support the line during the running of the trench and laying of the pipes.

After the pipes are laid, cement concrete is filled in 12ins. around the pipes, with 2ft. of lime concrete on top of this. In some cases where the trench is close to the sleepers in level, the concrete is carried right up to the latter.

It may be mentioned that the strength of a 12in. × 12in. timber over a trench, say 4ft. in width, would be as follows:—

Moment of resistance by 12×12 beam $= Zf$

$$= \frac{\frac{bd^3}{12}}{Y} f = \frac{\frac{12 \times 12^3}{12}}{6} \times \cdot 5 \text{ tons} = 144 \text{ inch tons.}$$

The bending moment is for a concentrated load $\frac{W.L. \times 12}{4}$, therefore BM=MRW will be obtained, and is found to be 12 tons for each wheel. The timber is therefore perfectly safe for loads up to this weight.

A staging is required temporarily to support a water tank 12ft. by 6ft. in size. Whole timbers, 12in. × 12in. are fixed, as shown in Fig. 4, to form uprights to which, similar sized heads and sills are connected, braced together with 9in. × 4in. pieces, the fastenings being 1in. bolts.

On the top of the stage 9in. × 3in. rafters are spiked down, and 6in. × 6in. timbers are laid across these, on which the tank is supported.

Ancaster House, now forming Nos. 59 and 60, Lincoln's Inn Fields, on the west side, are to be preserved. The house was originally built by Inigo Jones for the Earls of Lindsay. The house was divided into two so far back as 1750.

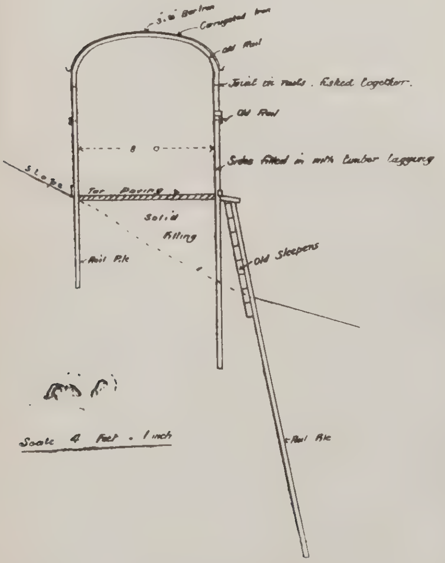

FIG. 2. TEMPORARY COVERED PASSAGE.

This is constructed of iron rails and covered with corrugated iron.

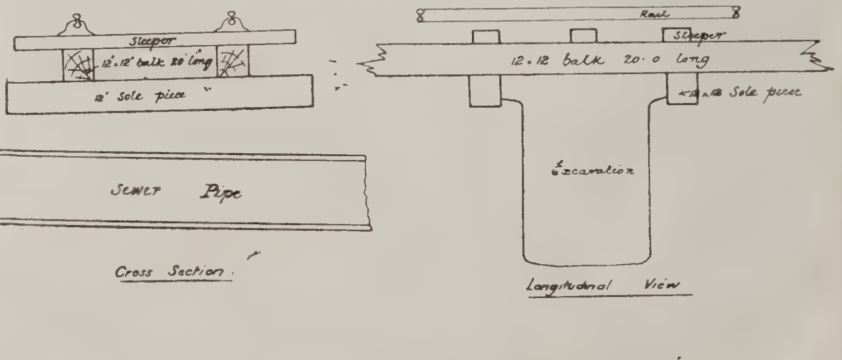

FIG. 3. CARRYING SEWER OR PIPE UNDER RAILWAY.

The timbering required in carrying a sewer or large water pipe under the lines of a railway is here shown.

Builders' Notes.

The Amended London Building Acts. The London Building Acts have become by repeated amendments as complicated as a will with many codicils. To the London Building Acts, 1894-1908, were added, last August, the amendments comprised in Part IV. of the London County Council (General Powers) Act, 1909, so that the correct title now is the "London Building Acts, 1894-1909." The amendments comprises sections 20 to 27, of which sections 22, 23, 25, and 26 are effective, the rest being formal or explanatory. Section 22 permits the use of skeleton framework. All rolled steel used in such construction shall comply with the British standard specification, and every pillar or girder shall be of iron or steel or any other structural metal which may hereafter be standardised by the Engineering Standards Committee.

Pillars and Girders. All pillars in external walls are to be completely enclosed and protected from the action of fire by a casing of brickwork or other incombustible materials at least 4ins. thick. Girders in external walls are to be similarly treated, but the casing on the underside and to the edges, flanges, plates, and angles may be of any thickness not less than 2ins. All pillars and girders in other positions must be encased to the satisfaction of the district surveyor, and to a thickness of not less than 2ins., but the casing on the upper surface of the upper flange of all girders and on the lower surface of all subsidiary joists may be of any thickness not less than 1in., and wood firrings are not to be used in connection with such casing; and the subsection making these provisions does not apply to buildings of only one storey and not more than 25ft. high. Whenever the length of a girder exceeds thirty times the width of the compression flange, the girder must be secured against buckling, and the web, whose depth exceeds sixty times its thickness, must also be secured against buckling. The span of a girder is

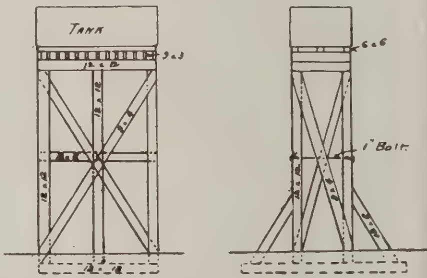

FIG. 4. STAGING TO SUPPORT WATER TANK.

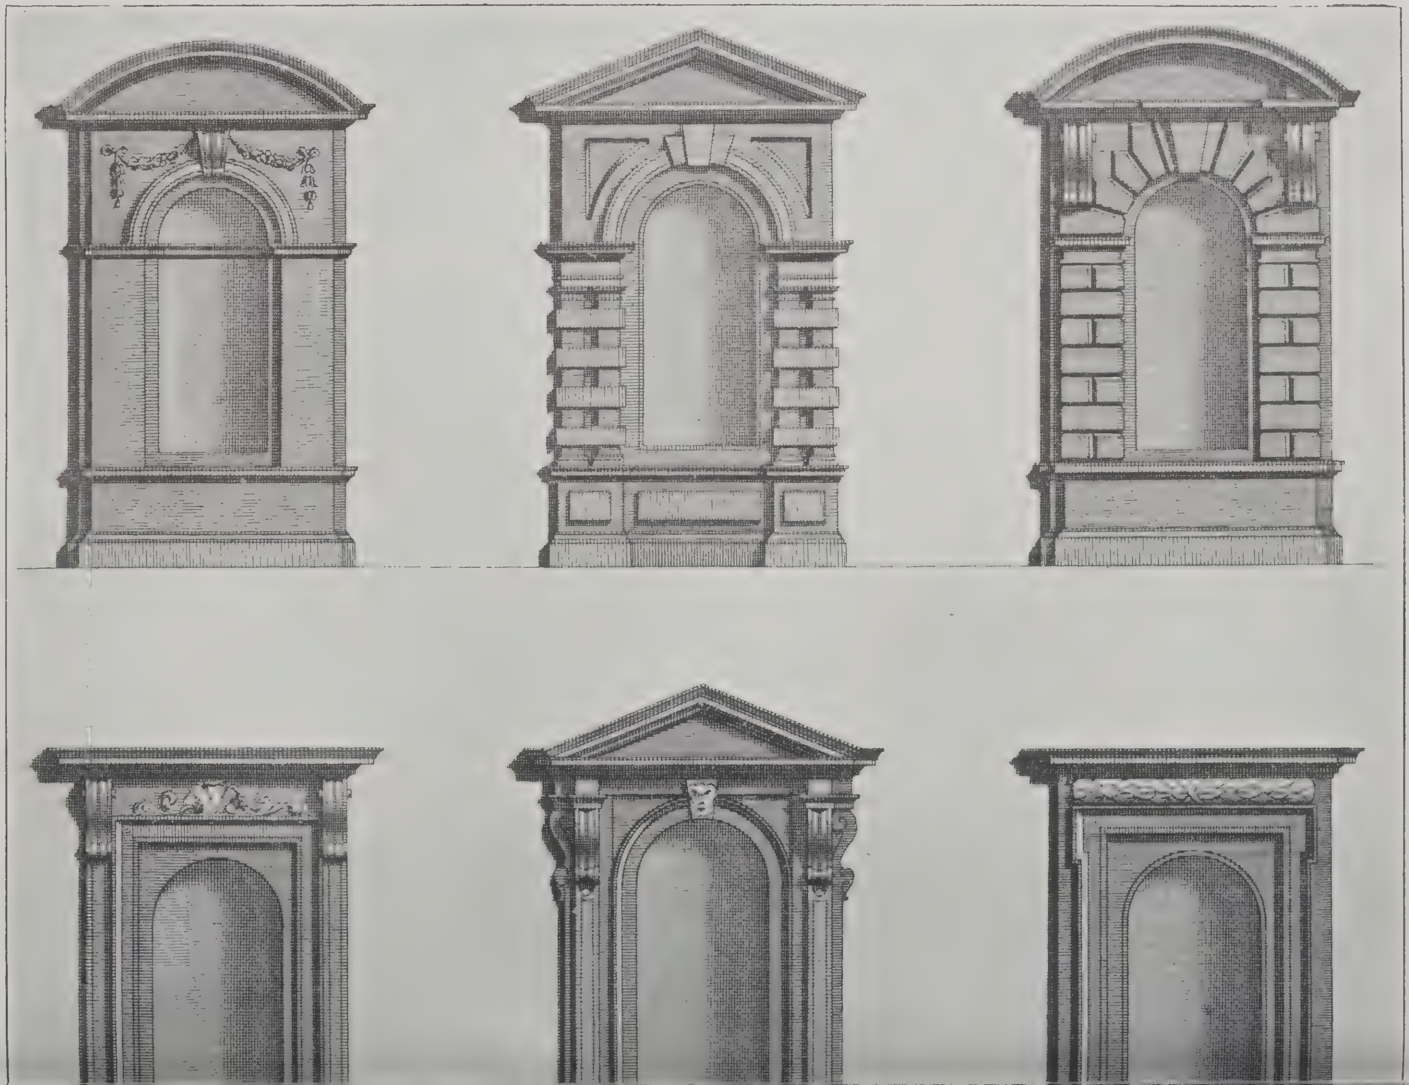
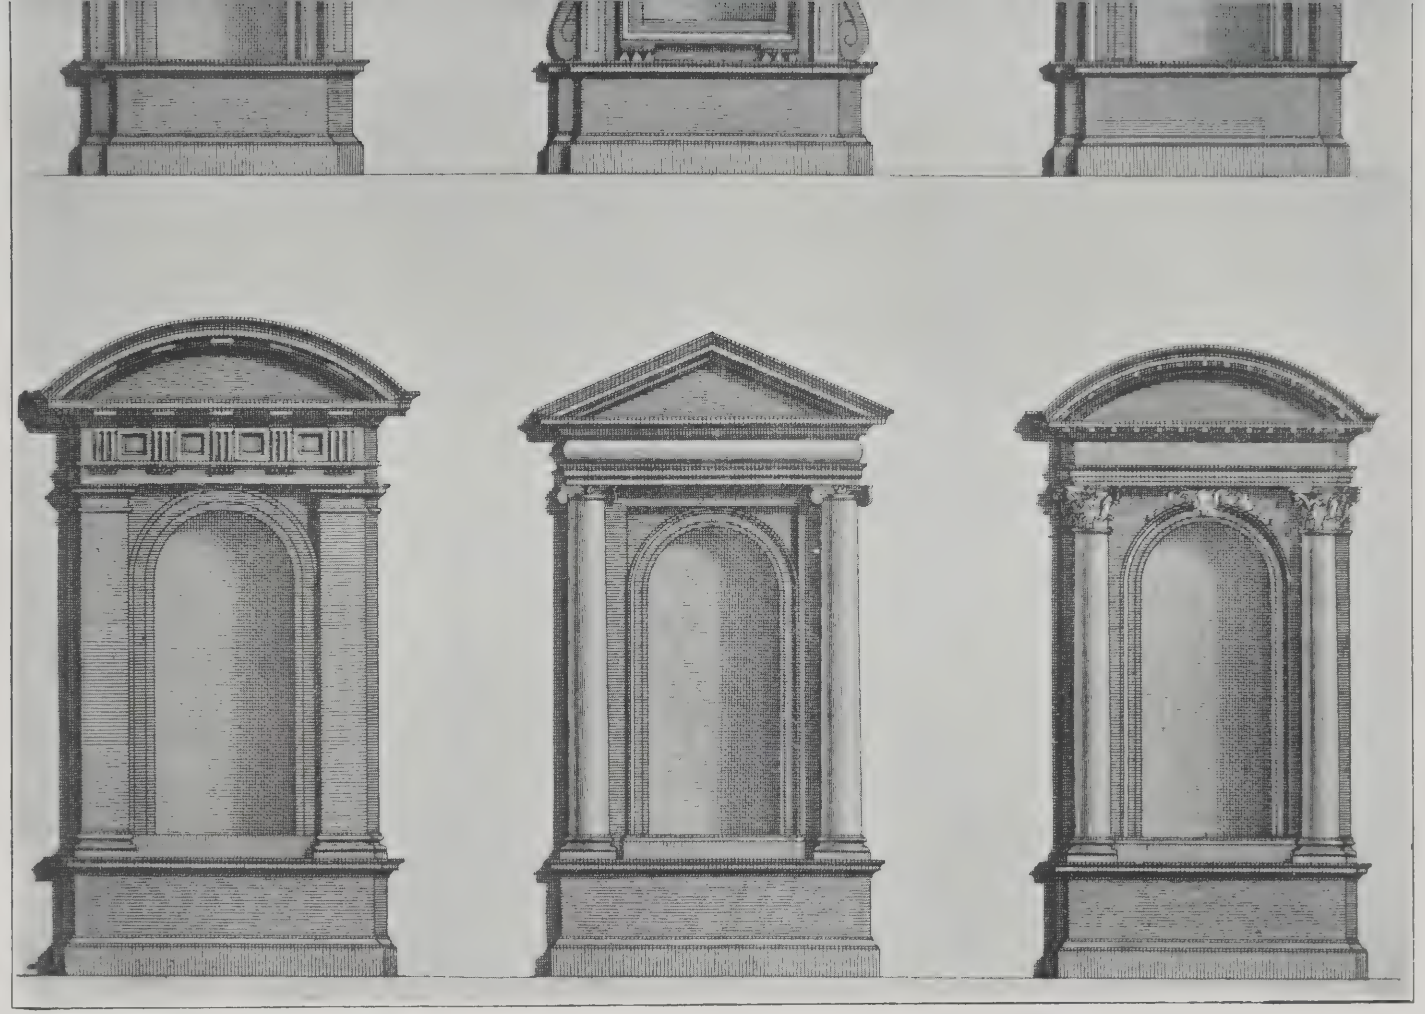
The fastenings for the timbers are 1 in. bolts; and at the top of the stage 9 in. by 3 in, rafters are spiked down.





DESIGNS FOR NICHES. BY JAMES GIBBS.

not to exceed twenty-four times its depth, unless the calculated deflection is less than one-four-hundredth part of the span. Three sub-sections are devoted to the position and fixing of girders. As to walls, the chief item of interest is that an external wall supported by metal framework may be of any thickness not less than 8½ins. for the topmost 20ft. of its height, and 13ins. for the remainder of its height below such topmost 20ft.

Party Walls. All party walls must be of the thickness prescribed in the principal Acts. All brickwork and work in which terra-cotta, concrete, stone, tiles, or other similar materials are used shall be executed in Portland cement mortar of British standard specification, and shall be bedded close up to the metal framework without any intervening cavity, and all joints shall be made full and solid; but on party walls, except parts immediately surrounding metal framework, and in other internal brickwork that does not carry loads or stresses, lime mortar may be used. No plate or bar in any steel or wrought-iron pillar shall in any part be less than ¼in. thick, and the bases of all such pillars shall be at right angles to the axis. Pillars that are built up hollow must either be filled up with concrete or be covered in at both ends by metal plates. The dimensions, structure, and jointing of pillars are prescribed in detail; the loading of floors and roofs is particularised, and tables of working stresses have been drawn up. In section 23 the Council is empowered to make regulations with respect to the construction of buildings wholly or partly of reinforced concrete, and for the purpose of framing such regulations may carry out investigations and make tests.

Appeal and Fees. Section 25 varies the Tribunal of Appeal, by enacting that a member of the Institution of Civil Engineers shall sit with the other three members now constituting that body. Section 26 entitles the district surveyor to a fee equal to two and a-half times the amount specified in Part I. of the Third Schedule to the London Building Act, 1894. These, in outline, are the principal provisions of the new enactment. The full text forms Appendix VI. in Professor Banister Fletcher's edition of "The London Building Acts, 1894-1909," fourth edition, and is also issued separately, price sixpence net, by Mr. B. T. Batsford, 94, High Holborn.

Builders at Bay. It has been already recorded in this journal that the "speculative builders of Portsmouth," as they are called in the local Press, have been impelled by recent proceedings in the Town Council, to hold a meeting of protest, and to form an association for the defence of their interest. The builders seem to have taken umbrage at certain remarks made in the course of debate at Town Council meetings; and apparently they object to the closer supervision implied in a resolution proposed by Councillor Mactavish (but rejected) in the following terms: "That the Roads and Works Committee submit a monthly report to the Council, giving the number of houses in course of construction in the borough, the number of visits paid by our inspector, the number of samples taken for analysis, and the borough analyst's report." In moving the resolution, Councillor Mactavish disclaimed any reflection on the master builders of the town, who, he believed, were as a rule "as honest as a man could be in competitive business" (!); but he "also knew that there were others who were not so honest," and he claimed that his resolution was not only in the interests of the public, but it would also help to protect the genuine builder against the unfair competition of the shoddy builder. "If even a genuine builder found his prices continuously undercut by those with fewer scruples than himself, he was either compelled to adopt similar methods or go to the wall." In the circumstances, the last clause is an infelicitous figure of speech.

To Benefit Builders. By a similar rhetorical device, it is claimed that hunting is beneficial to the fox, who ought to be grateful for it; and in each contention there is a sufficient modicum of truth to lend speciousness to the theory. But the fox is not conspicuously thankful to the huntsmen and the hounds for his preservation, and his alleged enjoyment of the sport has never been authoritatively confirmed. Similarly, the builders would much rather be left to the protection of their own interests, and they are very decidedly of opinion that the hunting and worrying system so considerately prescribed for the benefit of their health would have the exactly opposite effect.

"Arrows of the Chase." At a largely-attended meeting of builders who considered that their interests were seriously involved, the chairman, Mr. A. Chase, whose name, if we may be pardoned the allusion, seems rather to harmonise with the fox-hunting parallel, warmly protested against the "dead set" which he declared had been made in the Council against the speculative builders of the town. He complained of unfair criticisms and unjust assertions, and said that a crisis had been consequently produced, because the speculative builder depended absolutely on finding purchasers for houses, and if the statements in the Council were believed, "houses would not be sold, credit would be stopped, finance would not be forthcoming, and mortgages would not be found."

A Matter of Mortar. That, again, is perhaps rather rhetorical. We get nearer to practical affairs in the contention that mortar that is to be subjected to the rigours of analysis ought to be either mixed by a chemist, or tested by an average of samples. The builders, Mr. Chase protested, tried to meet the public needs in a fair, just, and honourable way, and they demanded a fair, just, and efficient test. Other speakers having delivered themselves in much the same strain, it was resolved to form an Association of Speculative Builders, with Mr. A. Chase as president, Mr. M. Hart as secretary, and Mr. W A. Baily as treasurer.

Combination for Protection. Precisely why they should have thought it necessary to do this is not quite clearly evident from the available records. They resented, very naturally, the aspersions and insinuations levelled against them in the Council Chamber, where zeal for the public health and welfare is apt to wax prodigiously when polling-day is in sight; and they are probably justified in the fear that rigorous and remorseless application of stringent by-laws might here, as elsewhere, harass the builder to distraction without doing an atom of good to the public; but, in opposing sober common sense to perhaps fanatical zeal, was it necessary to form a special organisation? We should have thought the National Federation of Building Trades' Employers, of which there is a powerful association at Portsmouth, would have provided the necessary machinery for dealing with any attempt to persecute members of the industry.

When By-laws are Abused. It is necessary that by-laws should be strict; it is not necessary that they should be strictly enforced in defiance of everything but the letter of the law. It is necessary that they should represent a high standard; it is not necessary that merely technical infringement of that high standard should be remorselessly penalised in every detected instance. Whether the by-laws of any authority are interpreted and enforced in accordance with their spirit, or in accordance with their spirit, or in accordance with their letter, and whether or not they are used as an instrument for the public welfare or as an engine of persecution against the builder, depends very much on the tone and temper prevailing on any particular Council at any particular time; and the two most effectual ways of preserving the tone and temper sound and sane are to see that the industry is properly represented on it, and that the individual representation is properly supported by organised efforts.

Birmingham Builders' Report. The annual report of the Birmingham Building Trades Employers' Association, submitted at the annual meeting last Thursday, states that, in common with most trades in the city, the building trade during the last year has been in a very depressed state, and that there is at present no sign of a revival. The committee report that, as a result of the notices served on the operatives in November, 1908, uniformity of working hours in all trades has been secured. All the rules, except with the stonemasons, were settled by the local Conciliation Board. The masons pressed for the insertion of a rule prohibiting the introduction of worked stone into Birmingham, and as the employers were unwilling to accede to this, the matter was referred to the Midland Centre Conciliation Board, who decided the point against the masons. At the last annual meeting of the association the inter-trading rule was adopted, and as a result there had been a large increase in the number of members, the total now being 140, as compared with 84 at the end of last year. It having come to the knowledge of the committee that the question of revising the Birmingham building by-laws was under consideration, Mr. John J. Moffat, at the request of the committee, undertook to confer with the city surveyor and representatives of the Architectural Association and Surveyors' Institution on this subject. During the year the work of the association had been exceptionally heavy, involving the revision of the rules with all the operatives, the remodelling of the association rules, consequent upon the introduction of the inter-trading rule, and the introduction of the telephone card. With regret the committee reported that Mr. E. J. Bigwood, secretary for a period of twenty-five years, had found it necessary to resign his office owing to increasing pressure of other business. During his long term of office he had shown a devoted interest in the work of the association. The balance-sheet showed a balance of £45 3s. 6d. to the credit of the association.

Our Plate.

We give this week the last of our reproductions of designs by James Gibbs for various architectural details. Of the niches here shown those in the middle row will probably most commend themselves to the attention of readers. James Gibbs was born at Fittysmere, near Aberdeen, on December 26th, 1682, the second son of Peter Gibbs, a merchant. He was educated at Aberdeen Grammar School, and took his M.A. degree at Marischal College there. He studied architecture in Rome under Garroli and Carolo Fontana the younger. On his return to England about 1709, he became associated with Wren. His most famous buildings are the churches of St. Mary-le-Strand and St. Martin's-in-the-Fields, London, and the Radcliffe Library, Oxford.

The Budget Protest League states that builders and persons interested in the building and allied trades in the East of London have now fallen into line with their colleagues in the West, North-West, and North, and have issued a memorandum against the Budget. There are 38 signatories to the protest.

Societies and Institutions.

Society of Architects.

The Society of Architects held, on Monday, November 8th inst., at St. Bride's Institute, Fleet Street, E.C., a students' social evening, at which the presentation of prizes gained in competition was made. An exhibition of students' drawings and sketches was also held. The President, Mr. Geo. E. Bond, J.P., delivered a short address, and then made the following award of prizes:—Charles Hudson, a silver medal and a cheque value £25, for first position in the secondary school competition; G. L. Evans, prize value £10, for second position in the secondary school competition; D. H. H. Barry (first year student), and J. Pickup (second year student) were awarded the correspondence prizes, and Mr. J. T. Westbye obtained the prize value £3 3s. for the best series of sketches made during the year.

A demonstration of the working of the correspondence classes was then given; and afterwards a number of artistes gave an excellent musical entertainment.

Leeds and Yorkshire Architectural Society

The first general meeting of the winter session of Leeds and Yorkshire Architectural Society was held on Thursday evening, November 4th, at the Society's rooms, Park Street, Leeds. Several new members were admitted. The President, Mr. Percy Robinson, F.R.I.B.A., in the chair, announced the results of the Society's annual competitions, which, although lacking the keenness of previous years, had called forth work of a higher standard, the selection of sketches exhibited being particularly good. The prizes were awarded as follows:—Silver medal and President's prize for measured drawings to Mr. P. de Jong; prize for design, Mr. P. de Jong; for sketching, Mr. J. H. Farrar; for construction, Mr. J. H. Farrar; for essay, Mr. F. Satchard; Halden prize for testimonies of study, Mr. F. L. Kruckenberg. Sketching Club competition: For best set of studies of ancient buildings, Mr. G. H. Foggit; for best set of sketches, Mr. P. de Jong; for second best set of sketches (consolation prize), Mr. C. T. Whiteley. The remainder of the evening was occupied in an examination and criticism of the students' drawings by its members present. The annual smoking concert and distribution of prizes was held at the Queen's Hotel, Leeds, on Thursday evening, November 11th.

Glasgow Architectural Craftsmen's Society.

At a meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society, Professor Charles Gourlay, B.Sc., A.R.I.B.A., delivered a lecture entitled, "The Building of a House." Beginning by defining building construction as the added sum of all the building crafts controlled as regards design by the master mind of the architect, the Professor proceeded to treat his subject on the basis of this definition. He pointed out how fundamentally necessary it was that the student should study at least one entire building to enable him to appreciate the many varied processes which are involved in the construction of buildings. To emphasise this view, he then showed a series of slides giving complete working drawings for a country house, in which as many different constructional details had been included as possible, while maintaining the unity of the design as a whole. In conclusion, he urged the importance of all architectural craftsmen pursuing a general course of this nature in building construction.—JOHN WILSON, Secretary.

Dr. Tristram, Chancellor of the Diocese of London, has decreed a faculty (subject to any objection that may arise with regard to disturbance of graves), permitting the execution of the scheme for the improved warming and ventilation of St. Paul's Cathedral.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Nov. 19.	SCHOOL FOR GIRLS, SALTBURN. Applications from architects for instructions prepared by Mr. Paul Waterhouse, the assessor in this competition, must reach The Secretary, North Riding Education Committee, Education Offices, County Hall, Northallerton, not later than the date named. The committee reserve the right of selecting and limiting the number of competitors.
Nov. 24.	GARDEN CITY PLAN, BURY. LANCS. In connection with the forthcoming exhibition of cottage designs in the Bury Art Gallery, the Bury Housing and Town-planning Association offer three prizes for a design for laying out a garden city suburb within the confines of the Borough of Bury. First prize £5; second prize £3; third prize £1 10s. Designs should be sent to H. Townend, Curator, Art Gallery, Bury, Lancashire.
Nov. 30.	HERNE BAY PAVILION ON PIER Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: on. guinea.
Nov. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addresse foolscap envelope and the payment of a deposit of one guinea. Deposi returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Dec. 1.	TRALEE. CARNEGIE LIBRARY AND TECHNICAL SCHOOL. Cost not to exceed £4,500. Premiums of £20 and £10 for design placed first and second by the assessor. Copies of instructions and conditions from the Town Clerk, Tralee.
Dec. 1.	PUBLIC PARK PLAN, BANGOR (COUNTY DOWN). The U.D. Council offer a premium of £30 for the best scheme for laying out a public park, twenty acres in extent. Premium to include all expenses of successful competitor, whose designs become the property of the Council. Schemes to J. Middleton, Town Clerk, Town Hall, Bangor, County Down.
Dec. 11.	MINEHEAD. SHELTER, with cloakroom and lavatories, on the Beach, the whole expense of which is not to exceed £3,000. Premium of £20. Plan of site and conditions from L. C. Webber-Incledon Clerk to U.D. Council, 16, Park Street, Minehead, Somerset.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
1910. Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.

Workington Technical School Competition

We are desired by the Secretary of the Royal Institute of British Architects to mention, for the information of architects proposing to take part in this competition, that the R.I.B.A. Competitions Committee is in communication with the promoters with a view to the amendment of the conditions of this competition.

Law Case.

Arbitration on Hot Water Supply Service Installation.

In the heating and domestic engineering trade disputes have been caused within the last few years in some districts by the aggressive action of the plumbers in claiming a monopoly of pipe fitting and fixing work in all metals (whether lead or not), to the exclusion of any other trade. With the object of preventing such disputes, the engineers have all along been willing to submit the whole matter to arbitration for a general, national settlement. A step in this direction has now been taken in connection with a dispute on the new Masonic Hall, Leicester. Lead work is not in dispute, as it is not touched by the engineers. After protracted delay the plumbers agreed to join in an application to the Board of Trade to appoint an arbitrator to hear and determine the question of dispute between the parties. Alderman T. Smith, J.P., was appointed to act as arbitrator, and heard the case in Leicester on the 5th and 6th inst., the parties represented being Messrs. Ashwell and Nesbit, Ltd., the heating and domestic engineering contractors, the Masters' National Association, and the Operatives' National Union connected with this trade, on one side; and the plumbers' section of the Leicester and District Building Trades Employers' Association and the United Operative Plumbers' Association (Leicester District), on the other side. At the termination of the proceedings the arbitrator reserved his award, but it is expected to be given immediately.

The Kalendar of the Manchester Society of Architects, covering the forty-fifth session, 1909-10, has appeared, price sixpence.

* * *

Chelsea Borough Council has received official intimation from the Superintending Architect, London County Council, that that body has consented to the erection of New Crosby Hall on the northern side of Cheyne Walk. This building is to be commenced within six months and completed within eighteen months, dating from August 27th last, and it is to be erected and retained without any addition, and in exact accordance with the application of the University and City Association of London, Ltd.

Obituary.

Mr. Thomas Worthington, F.R.I.B.A.

We regret to announce the death, which took place on the 9th inst., of Mr. Thomas Worthington, the well-known Manchester architect. Mr. Worthington was born in the year 1826 in Crescent Parade, Salford, and educated at Dr. Beard's school. Among his contemporaries there were John Ashton Nichols, Christopher Kay, and Sam Pope, Q.C. At a comparatively early age he left school to enter the office of Mr. Henry Bowman, a scholarly architect of literary tastes, who afterwards took Mr. Crowther into partnership. He served his articles with this firm, and during this time was founded his very accurate knowledge of architectural detail, which was extended by the measurement, in company with Mr. Bowman, of mediæval work, principally undertaken with a view to the publication of Bowman and Crowther's "Churches of the Middle Ages," many of the fine illustrations in which were his work.

When nineteen years old he won the Isis gold medal given by the Society of Arts for a design for a church, and two years later, in 1846, an essay obtained for him the silver medal of the Royal Society of British Architects. By these successes and through his elder brother, Mr. William Barton Worthington, he became known to Sir William Tite, who invited him to join his staff for the building of Carlisle railway station. In 1847 the work there was suspended owing to the railway crash, and Mr. Worthington made use of his enforced holiday to visit Italy. His travelling companion was Mr. H. D. Darbishire.

On returning to England he worked for a time in London with Sir William Tite, and then settled in Manchester. He acted as local secretary for the Great Exhibition of 1851, and became a member of the Councils of the School of Art, the Royal Manchester Institution, and the Sanitary Association. He was secretary to the Committee for the Wellington Memorial, and it was largely due to his efforts and to those of Bishop Lee that the Infirmary Esplanade took the place of an unsavoury waste place and dirty water.

His first work of any size was the Overseers' and Churchwardens' Offices in Fountain Street; after these be built several large baths and washhouses, the Lancaster railway station, and numerous private houses. To the important works of his later years must be added Manchester College, Oxford, Brookfield Church, Gorton, and other churches, and the memorial fountain to Lord Frederick Cavendish at Bolton Abbey. Hospital work formed a considerable part of his practice. He was one of the first architects to adopt the pavilion system of hospital planning, and he built the Royal Infirmary at Halifax, the Royal Infirmary at Wigan, the Royal Bath Hospital at Harrogate, the Chorlton Union and Prestwich Infirmaries, the Convalescent Institution, Liverpool, and other similar institutions. Other work was done in partnership with Mr. Elgood, who died in 1893, and with his son, Mr. Percy S. Worthington, who became his partner in 1891, and who now carries on the practice.

Mr. Worthington became a Fellow of the Royal Institute of British Architects in 1865, and was its vice-president from 1885 to 1889. He was president of the Manchester Society of Architects from 1875 to 1877, and for many years took an active part in its work. Perhaps his chief interest outside his profession was the work of the Royal Manchester Institution, of which he was president for several years.

Messrs. J. H. Nicholson and Co., heating, ventilating and general engineers, have moved their offices from Suffolk House, Lawrence Pountney Hill, Cannon Street, E.C., to larger and more commodious premises at 110, Cannon Street, E.C.

DRAWN BY F. L. GRIGGS.

Notes and News.

Mr. James Kiernan, builder, has moved from 100, Talbot Street, Dublin, to Richmond Works, North Richmond Street, Dublin.

* * *

Mr. H. G. Norris, auctioneer and estate agent, and partner in the firm of Allen and Norris, builders, has been elected Mayor of Fulham. Mr. Max Clarke, F.R.I.B.A., the well-known architect, has also been elected to a Mayoralty, that of Holborn.

* * *

A public meeting held at St. Cross, Winchester, has decided to honour and perpetuate the memory of the late Master of St. Cross, Canon the Hon. Alan Brodrick, by the erection of a memorial, the form of which is to be decided upon by the subscribers. A strong and influential committee has been formed to carry out the project.

* * *

Two famous residences will shortly come into the market, Kelmscott House, well-known as the home of William Morris; and the house of Mr. Mortimer Menpes, 29, Cadogan Gardens, which will be put up with the furniture. It will be recollected that this house was decorated by Japanese artists working under Mr. Menpes' direction.

* * *

The entire sanitary installation of the new Automobile Club, Pall Mall, London, including all fittings, which is in course of erection on the site of the Old War Office, Pall Mall, under the direction of Messrs. Mewès and Davis and E. Keynes Purchase, associated architects, is to be carried out by Messrs. Doulton and Co., Limited, sanitary engineers, Lambeth, London, S.E.

* * *

The Sir John Moore centenary memorial at Sandgate will be unveiled by Miss Mary Carrick Moore, great niece of the famous soldier, on Friday, November 19th, at 2 p.m. Sir E. A. Sassoon, Bart., M.P., will preside. For the convenience of visitors, the S.E. and Chatham Railway Co. have arranged that the 10 a.m. Continental express from Charing Cross shall stop at Sandling Junction for Sandgate. Professor Bonanni is the sculptor.

* * *

Mr. J. Howard Colls, of Messrs. George Trollope and Sons, and Colls and Sons, Camberwell, who was asked by the local branch of the General Union of Carpenters and Joiners for a subscription for the unemployed, has sent a donation, accompanied by a letter, in which he says:—

"The work that has to be done by you and me has to be paid for by people who have the money to spend, and directly you arouse in them the feeling of insecurity—and there is no doubt that this feeling has been aroused—they naturally refrain from spending this money.

"Unfortunately, the building trade suffers more than any other in this respect, because certainly more than half of the work done by builders is not a necessity, but a luxury. You, if you call to mind the various jobs you have been to from time to time, must realise this undoubted fact, and I know, from my own experience, of the enormous amount of work of this nature which has been abandoned. . . . .

"I can tell you that not only is the work of which I have spoken—that is, the general work done for ordinary people—abandoned, but there is almost an entire stoppage of supplies from those who in the past have lent money on mortgage on building land and the buildings erected upon it. . . . .

"You may think that this should not be so, but, after all, you have to deal with facts, and in your own interests it is well you should consider how far this stoppage can be prevented, and whether it would not be much wiser and better for you if these unwise attacks upon capital, as such, had not been made, and were now discontinued."

The London County Council are arranging to obtain certain restrictive covenants on the Meadowside and Meadowbank estates at Twickenham. These lands adjoin Marble Hill, the central feature of the famous view from Richmond Hill, which was preserved from building development by being purchased some years ago and turned into a public park.

SOME CAUSES OF FAULTY CONCRETE CONSTRUCTION.

(*Concluded from page* 370, No. 770.)

There is no end to the opinions relative to the contraction and expansion of concrete floors and its causes. Cement naturally expands very slightly, and so, therefore, must concrete, unless we assume that its particles undergo slight compression arising from the action of the cement, which is not improbable. The general opinion held in regard to the expansion of concrete is that it expands slightly when first deposited in place; but when the permanent set of the cement has taken place, say within 48 hours, often expansion ceases, and as a large floor is usually some time in hand, the bulk of the concrete has passed beyond the expansion stage before it is completed. How long it is before contraction takes place seems to depend upon surrounding circumstances.

The greater care taken in the preparation of sand and aggregate mixed with cement, the less liable the concrete is to expand.

Use of Boiler Clinker and Flue Ashes and Coal.

A common failure of the practical test of cement in concrete is caused by the use of coke-breeze or furnace cinders as an aggregate. It is very often the case that small pieces of under-burned coal and even of coal not burned at all are included in the bulk quantity of these aggregates for concrete-making, and the result is often an entire distintegration of the concrete mass. Boiler flue-dust is often again used in place of sand for concreting purposes, and the result is often eminently unsatisfactory in cement work. The coal ash material taken from boiler flues is generally found to contain sulphurous acid and sulphite of calcium originated by the sulphur found in the fuel, and the result of this is that by "weathering," a concrete made with such material will suffer complete disintegration, or other results will happen more or less serious in proportion to the quantity of this aggregate used. If the flue ash is old and has been well aerated or slaked with water previous to using there is a less risk of disintegration ensuing, but this treatment by no means makes flue dust a safe aggregate to use with cement.

Another case of expansion of a boiler-ash aggregate in concrete is explained in the following instance:—

A concrete roof, composed of one part of cement to 4½ parts of boiler ashes, showed signs of expansion (not disintegration) within three weeks of the laying of the concrete, and continued to expand during the period of observation, viz., two months.

The roof sloped from a central ridge, each slope being divided into four or five bays. The expansion of the lowest bay had forced out the L iron holding the roof, and in so doing had broken the ½in. bolts attaching the L iron to the walls. The concrete in the middle bays being held at the ends by the purlins had buckled upwards, while the top bay of each slope had forced up the ridge of the roof. The walls on which the roof rested and the gable end wall were forced outwards by the expansion.

The cement was of normal slow setting quality, and showed 3 mm. expansion in the Chatelier test when fresh and 2 mm. when used. There was no sign of disintegration of the roof, and pieces of the concrete immersed in boiling water for several hours remained unaltered, and even hard.

It is a reasonable conclusion, therefore, that the boiler ashes in the concrete were responsible for the expansion, although it is remarkable that a roof composed of cement and ashes from the same source erected a year previously is satisfactory in every way.

To demonstrate the expansive tendency of boiler ash concrete a number of bottles were filled with concrete composed of slow setting cement (of 3 mm. expansion) with 5 parts of various aggregates. The behaviour of these bottles was as follows:—

Neat cement.—Bottle intact after 28 hours.

Boiler ash concrete (4½—1).—Bottle burst in 5 days.

Coal (pea-size) concrete (4½—1).—Bottle burst in three days.

Granite concrete (4½—1).—Bottle intact after 28 days.

Coke-breeze concrete (4½—1).—Bottle intact after 28 days.

Ground coal concrete (4½—1).—Bottle cracked in 19 days.

Boiler ash concrete (4½—1), free from combustible matter.—Bottle intact after 20 days.

The tendency of boiler ash concrete to expand was thus illustrated, and although the investigation was not sufficiently extensive to allow of a definite statement being made, it would seem that coal, which is an invariable constituent of ordinary boiler ashes, is the disturbing element.

As to the precise cause of the swelling of boiler ash concrete, it is difficult to express an opinion in the present state of definite knowledge upon the point, although observations have indicated that the presence of combustible matter is responsible for the expansion, and this may probably cause disintegration in time.

Cinder Concrete.

The writer of an editorial note in a specialist organ seems to be rather distressed about the disfavour with which cinder concrete is regarded in Germany, and particularly concerning the ministerial order forbidding the use of coal residues as aggregate for reinforced concrete and for concrete which may côme in contact with structural iron or steel. In seeking to minimise the force of this prohibition he suggests that the word "kohlenschlacke" means a local variety of coal residue containing a considerable amount of sulphur and having the faults common to pan breeze in this country. This is quite wrong, for the general term "kohlenschlacke" (literally "coal cinders") covers all residues of every kind of coal. "Clean coke breeze" is the most combustible variety of coke residues, and therefore the least desirable for fire-resisting concrete. but in consequence of its value to the producers as fuel this quality of coke is scarcely obtainable in the present day, and builders are almost universally compelled to fall back upon "pan breeze"—or the material collected from the ash pans of coke ovens. Apart from any question of calorific value, an insuperable objection to all coal residues is the presence of sulphur, which exercises a deleterious influence on cement and embedded steel, and so justifies the embargo wisely placed upon the use of all coal cinders in reinforced concrete by various German authorities, and, also, by British architects and engineers who realise the importance of the question.

Cracks and Weather.

Concrete walls built in cold weather are less liable to cracks than those built in summer. Another feature of the same subject is that lime concrete is less liable than cement concrete to give evidence of expansion or contraction, and walls a hundred feet in length, built of the former material years ago, show no sign of any change. As lime is credited with being of a much more expansive nature when made into mortar than Portland cement, this is a conclusive proof that the matrice in a lime concrete wall, like the lime mortar of a brick wall, is of a yielding and compressible nature, and as Portland cement is the reverse, we have to attribute to this fact the cracks which cement walls are sometimes liable to.

Heavily Loaded Walls.

It is noticeable, too, that high concrete walls, or walls heavily loaded, give but little evidence of contraction or expansion, a natural result of the counteracting force exercised by the great weight imposed thereon, and the transverse tie of floors, cross walls, etc., while, on the other hand, in low thin boundary walls, cracks of considerable size often appear, and an almost uniform distance apart. The upper portions of concrete boundary and dwarf walls are more disfigured by cracks than the lower, owing to the tie or key which the foundations, or portions below ground, give to the part nearest thereto.

Temperature Cracks in Walls.

Another reason why boundary and similar walls afford such direct and palpable evidence of change of temperature is, that they are exposed on both sides to extreme climatic influence, while walls of buildings are more protected, one side being subject to but little variation of temperature. Some curious remedies have been proposed for this misfortune to concrete, not the least striking being to make vertical joints in the walls of concrete houses by inserting a piece of wood or iron every 12 or 15 feet apart—practically building them in sections—so that instead of irregular cracks, less unsightly ones should be substituted.

Precautions Necessary in Wall Construction.

Although it is not often seen that serious consequences arise from shrinkage and expansion in concrete walls, it is fair to assume that the latter must be weakened to some extent, and the appearance is most objectionable; all necessary precautions should therefore be taken to prevent them.

A free use of water thrown over concrete saturating the material, in hot weather a desirable practice, and the concrete work should not be rushed unless great urgency of erection is necessary.

Obviously, too, when operations are suspended for a time, or walls are for any reason stopped off at some part of the buildings, the stoppage should not occur at the weakest points, as, for instance, near door or window openings, for the concrete is then less able to resist the strain caused by climatic conditions.

Cracks in Walls where Work is Pieced.

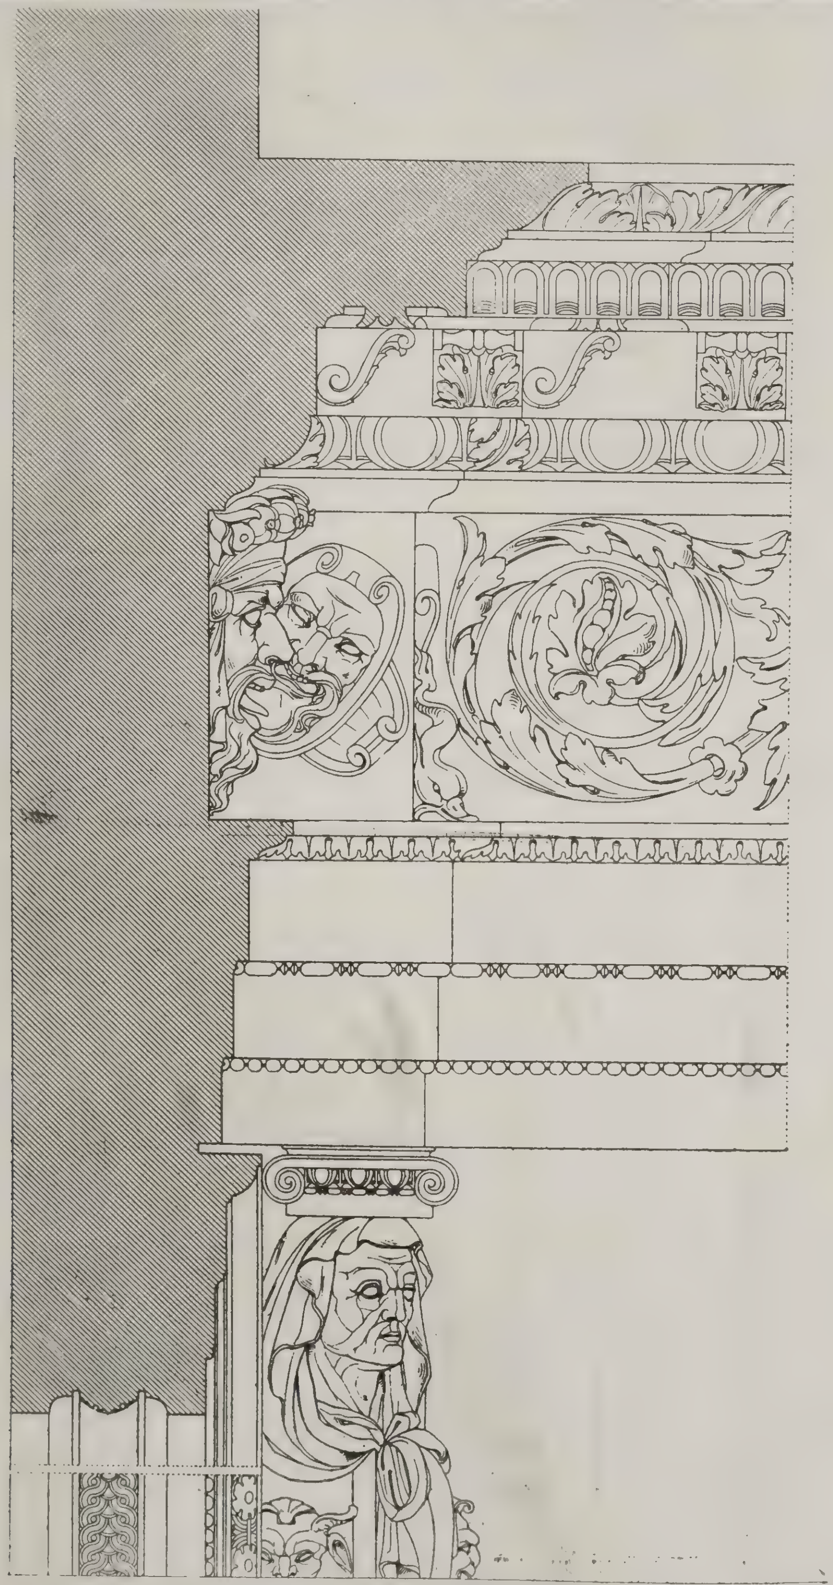
Sometimes where it is not practicable to store cement on the job, low walls, which have been erected in pieces, will show horizontal fissures or cracks between each "lift" or layer of concrete, or where a section has been left for a time before another deposit has been made.

Temperature Cracks in Bulk Concrete.

In large and bulky concrete works, such as in the case of dam and reservoir construction, temperature cracks are often found to occur which cause the engineer in charge considerable apprehension.

Although the Portland cement used in concrete work is often stated to be the cause of any untoward incident in the concrete construction, yet, in such cases as those now described, the trouble will invariably be found to arise from the effects of thermal variations of dimensions, and this defect is substantially the same, whether the older class of heavy rubble masonry is employed in construction or the more modern cyclopean concrete. This cracking, often seen in heavy masonry or large area constructions, has already been the subject of a considerable amount of investigation by engineers, and in dealing with this matter in a paper published by the American Society of Civil Engineers, Mr. Gowen describes the results of his observations on the cracks formed in the new Croton dam, near New York. In this work cracks in the bulk concrete were opened by the fall in temperature from summer to winter, while the construction of the upper part of the dam was in progress, and in another similar construction a dam at the Cross River, where the masonry of the uncompleted dam was exposed during one winter only, no substantial cracking was noticed until the cold weather of the next winter produced separation of the masonry at a number of points after the work was complete.

In the case of the cracks formed in the new Croton dam, then more particularly enquired into, it appeared there were three principal cracks in the main body of the dam, and three others in the overflow. All these cracks were in the top of the dam, where the masonry was thinner than in any other portion of the structure, and they opened with the falling temperature of the late autumn and winter, as would naturally be expected. The greater part of the main dam was built of heavy rubble, well and solidly laid so as to prevent seepage to the greatest possible extent. The widest crack was less than one-eighth of an inch. All of them extended through the mass of the dam at and near the top, but they ran out lower down. They were obviously capable of letting some water through, but the surfaces of parting of the masonry were necessarily rough and irregular, so that small quantities only could flow through. In the Cross river dam there was one interesting feature of construction not found in the Croton dam. A considerable number of twisted square and other deformed rods were laid in the masonry continuously from one end to the other for some distance down from the top of the structure for the purpose of reducing as much as possible the temperature cracking. No published account of the results of this experience at Cross river has yet appeared, but it is understood that about the usual amount of cracking took place. At first sight cracks like those described may



DETAIL OF ENTABLATURE: THE LOGGIA OF THE VILLA CAMBIASO, GENOA.
GALEAZZO ALESSI, ARCHITECT.

seem serious, but extended experience has shown that such is not the case. The openings are always narrow in the interior mass and so sinuous with rough surfaces as to create much resistance in the flow of water through them. It is true that a well-defined, although very small, stream appeared at the down-stream face of the dam, but its discharge measured little in actual volume, even in the coldest weather, and, therefore, when widest. They were easily stopped, almost entirely, in a number of ways, as by the use of mortar, lead, wool, or other means. When the cracks are filled with neat cement or cement mortar, the expansion of the next summer may crack or spawl off some masonry edges, and by thus filling the crack wherever they open, it will require but two or three seasons to secure an essentially continuous masonry mass, needing little or no subsequent attention. A long wall or conduit may require longitudinal reinforcement to prevent temperature cracks, and consequent leakage.

Cracks in Ornamental Floors.

Mosaic tile and terrazzo chips for floors, if bedded and grouted with cement, often become disfigured from cracks which do not appear until months, and possibly years, after the work has been executed. Sometimes these cracks follow the line of the joists supporting the concrete, at other times they are of an irregular shape. In the former case they are probably due to a slight shrinkage in the concrete where the joists break the continuity; but this does not account for those of irregular shape. The latter may arise from unseasoned cement, or cement which has not been tested for soundness, both for bedding and grouting; the large amount, comparatively, used for grouting and bedding terrazzo chips, helps still further to develop cracks.

In the case of mosaic paving the remedy appears to consist of laying it in small portions, leaving intervening spaces for a time before completing the work, or better still, forming with narrow bands the pattern and the general portion of the work to be done. The fine floor of the new booking office at the Waverley Station, Edinburgh, is greatly disfigured with cracks of a variety of shapes, and which did not appear for a long time after the floor was finished.

Surface Cracking.

The finish of concrete surfaces with Portland cement is often unsightly in the numerous surface-cracks which develop in the work, and this is regularly attributed by the ignorant to the unsoundness of the cement which is employed. This is a defect commonly seen in concrete work, and is known as "crazing." These cracks (sometimes also called "hair" cracks) appear on cement work or artificial stone after weathering, but the very unsightly appearance presented is often the full extent of the deterioration. The fine hair cracks which are so often discernible in artificial stone arise as a rule from the surface of the cement drying more rapidly than the bulky portion of the concrete. The defect, which is not the fault of the cement, can be entirely avoided by adapting the treatment of the materials to the work in hand. That this "crazing" or fine cracking originates in the manipulation of the concrete is proved by the fact that the same defect occurs in work carried out with the soundest and best made cements. These hair cracks appear to connect themselves wholly with a mortar too rich in cement.

No cement should be used in the dressing of concrete work without being well mixed with sand or other very fine aggregate, for the superficial cracks are caused by the natural variation in volume of the neat cement face of the stonework being disproportionate to the concrete bulk. When facing or dressing, the surface work or veneer must be well rubbed down to the concrete base of the stone work.

Hitherto practice has favoured a smooth surface for concrete, giving the uniform grey colour of the cement. In fact, many constructors have used as a surface finish an almost neat cement mixture, with the result that the surface produced was a dull grey, very difficult to secure uniformly, and hard to retain when once secured.

This method has been demonstrated to be wrong, and it has been shown that the surface of concrete should show, not the cement, but the aggregates. In this way only can a variety in surface finish be obtained. When the aggregates are made to constitute the surface an almost endless choice of surfaces is to be had, varying from a fine white sand finish, through all grades and shades of sandstone and quartz surfaces, to heavy and massive granite. The method is simple, and consists in using near the surface an aggregate of whatever finish is desired, and by removing the cement film from the concrete. When the moulds are removed this aggregate is brought out in relief, giving an artistic appearance. A very successful method for producing this finish consists in applying a solution to the concrete after it is hard and dry, which removes the cement, exposing the aggregate, and by careful washing a surface may be obtained that is practically everlasting, and one that can never show surface cracks, discolorations, or other imperfections inherent in a plain, untreated concrete surface.

Trade and Craft.

Fireplace Designs.

We have received from Messrs. Gripper and Beatley, 122, Great Portland Street, W., a catalogue of commendable designs for grates, interiors, mantel registers, and ranges. The majority of grate designs are founded upon antique patterns, and are marked by reticence and breadth in the design.

Margewood Locks.

We have received an illustrated catalogue describing the "Margewood" locks, in which the bolt and levers are combined instead of being separate working parts. The levers, instead of being pivoted to the lock plate and having only a single bearing, are pivoted in the bolt, in suchwise that they cannot get dislodged, and they form with it an inseparable working union. The lever stump is not pivoted to the thin tail of the bolt, but is a rigid fixture, with a double bearing in the lock plate; the bolt and levers travelling together as one piece over the lever stump. It will be seen, therefore, that the "Margewood" locks reverse the construction of lever locks, while retaining the advantages of the lever principle. The method of construction ensures that the bolt cannot be forced without shearing the lever stump from its double bearing. Overshooting or falling down of the bolt is impossible; the levers cannot get out of position; the lever stump cannot be forced, broken off, work loose, or get out of position. The difficulty of picking the lock is greatly increased, and its strength and durability seem to reach the utmost possible limit, the simplicity and equal balance of the parts rendering it almost impossible for any of them to get out of order. The "Margewood" locks, though of the highest class of manufacture—they are of British invention, and are made in England—are sold at popular prices, and are already in extensive use by the London County Council and other important public bodies. They are made for tills, drawers, safes, boxes, desks, and cupboards, as well as for doors—in fact, are adapted to all services; and they are also made in padlock form. The "building locks" section of the catalogue (which can be had from Margewood Locks, Ltd., 11, Clerkenwell Green, London, E.C.), shows various patterns and qualities of mortice and rim locks and latches; and actual specimens that have been submitted for our examination bear out all that is claimed for them. These locks have won the highest honours at several exhibitions.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Death of Mr. G. H. Storrs.

Profound sympathy is felt with our esteemed chairman of the National Board of Conciliation, Mr. Jas. Storrs, of Stalybridge, in the tragical fate which has befallen his partner and brother, Mr. G. H. Storrs, who was the victim of a murderous attack in his own house, on the evening of Monday, November 1st, as fully reported in the daily press. The president of the Federation has written to Mr. Storrs, expressing the sympathy of himself and his Council in this deplorable matter.

Forthcoming Meetings.

Meetings of Administrative and Journal Committee have been fixed for December 14th. A preliminary notice has been issued requesting matters for the agenda to be sent by November 25th.

The Executive Council and annual general meetings have been fixed for January 25th and 26th, 1910. Matters for the agenda of these meetings should reach the National secretary not later than December 31st next.

National Board of Conciliation.

Six months' notices of proposed alterations of the rules of above Board have been received, and advices thereof sent to the various county Federations.

The following are the

Proposed Alterations of and Additions to the Rules.

By the Amalgamated Society of Carpenters and Joiners.

New Rule (to amend Rule 19):—

(a) That any of the several Boards or branches of the trades affiliated shall have the power to suggest alterations and amendments to the rules, and the National Board shall alter the agreement in accordance with the majority of votes of the members of the various Boards.

New Rule:—

(b) That the representatives elected to sit on one of the Boards shall not be eligible to sit on either of the others, as a member or as a substitute.

New Rule (to amend Rule 3):—

(c) That each trade shall be represented by four delegates on the several board instead of two from each society. Each trade paying an equal share of the expenses, instead of each society as at present.

Amendment to Rule 4:—

(d) Should the Local Conciliation Board be unable to arrive at a settlement of any case or matter in dispute within fourteen days from the receipt of notice from either side, unless the time is extended by mutual consent, it shall be the duty of the aggrieved party to draw up the notice to the Centre Conciliation Board, which notice must be signed by both secretaries of the Local Conciliation Board prior to being sent to the Centre Conciliation Board, and a meeting of the said Centre Board must be held within ten days of the receipt of such notice for the purpose of hearing the appeal from the Local Board. (Remainder of rule as at present.)

Amendment to Rule 16:—

(e) Though in all ordinary cases the procedure shall follow the rules above written, yet for the purpose of more quickly arriving at an agreement on matters in dispute, it shall be competent for any of the several Boards by mutual and unanimous consent of the two parties, to call in an arbitrator, or arbitrators, with power to settle the dispute, and where this is done the decision of such arbitrator or arbitrators shall be final and binding. But when a case having proceeded through a local and Centre Board on to the National, and they are unable to come to a decision, this body shall then apply to the Board of Trade to appoint an arbitrator, such arbitrator to be a permanent paid official of the aforesaid Board, and whose decision shall be final and binding. The costs, if any, to be borne in equal shares by the employers and operatives unless left to the discretion of the arbitrator in all cases.

By the Associated Carpenters and Joiners' Society.

Amendment to Rule 16:—

(f) Identical with proposal (e).

Proposed New Rule:—

(g) That no individual be eligible to sit as a delegate on more than one section of the Conciliation Boards; this to apply strictly to both sides, employers and operatives.

By the Operative Stone Masons' Society.

Amendment to Rule 4:—

(h) Should the Local Conciliation Board be unable to arrive at a settlement of any case or matter in dispute within fourteen days from the receipt of notice from either side, unless the time is extended by mutual consent, it shall be the duty of the aggrieved party to draw up the notice to the Central Conciliation Board, which notice must be signed prior to being sent to the Central Conciliation Board, and a meeting of the latter must be held within ten days of the receipt of such notice for the purpose of hearing the appeal from the Local Board.

Proposed New Rule:—

(i) That in accordance with Conciliation Board, Rule 19, our society shall give due notice of alteration of rules, whereby a penalty clause, which shall be operative on both sides of the Board, shall be inserted for infringements.

By the Operative Bricklayers' Society.

Proposed New Rule:—

(j) That no individual be eligible to sit as a delegate on more than one section of the Conciliation Boards. This to apply to both sides, employers and operatives.

Amendment to Rule 16:—

(k) Identical with proposal (e).

Building and Engineering Works Bill.

This measure, which seeks powers which would enable the expected scaffolding regulations for the building trade to be issued, has been withdrawn for this session.

Conditions under which Tenders are sent in.

At the request of this Federation, a conference has been arranged for December 13th next, with the R.I.B.A., to discuss the desirability of some regulation of the conditions under which tenders are sent in.

The Comparative Statement of Wages and Hours of Labour

for the Federated towns will be republished in the Official Journal for December 15th. Secretaries of Local Associations and Federations are requested to forward particulars of any alterations which have occurred since last publication, to the undersigned, not later than December 7th.—A. G. WHITE, secretary.

The Northern Centre.

Secretary: James Denver, Cromwell Buildings, Blackfriars Street, Manchester.

The quarterly meeting of the Northern Centre Executive Council was held at the Hotel Metropole, King Street, Leeds, on October 18th, when Mr. Henry Matthews, J.P., Manchester, presided.

A notice for amending Rule 4 of the Conciliation Board rules, sent up by the Birkenhead Local Association, through the Lancashire and Cheshire Federation, was considered. The Birkenhead Association desired that the rule should be amended so that in case a local board fails to come to any decision, the aggrieved party in any dispute shall be allowed to draw up the letter of appeal to the higher authority. The matter received considerable discussion, and ultimately the following resolution was adopted: "That this Council do not consider the amendment as suggested by the Birkenhead Association necessary, and cannot therefore recommend it to the National Board for adoption." The secretary was instructed, however, to write pointing out that any notice of appeal should be as brief as possible, and that on no consideration should it contain statements of the case in dispute.

The question as to whether it would be desirable to enter into negotiations with the operatives' societies for the recognition of the rates of wages and working conditions in existence at the present time for a period of years was considered, but after some considerable discussion thereon, the matter was allowed to drop.

The secretary was instructed to get into communication again with the three Federations forming the centre, with a view to arranging as far as possible for uniformity of rules.—James Denver, secretary.

Northern Centre Conciliation Board.

A special meeting of the Northern Centre Conciliation Board was held at the Hotel Metropole, Leeds, on Monday, October 11th, when Mr. Thomas Wilkinson, Middlesbrough, presided.

The meeting having been called to hear an appeal from the Liverpool Local Board, witnesses were admitted to state their case. The operative joiners were claiming extra pay at the rate of 6d. per day (provided under Rule 3 of their working rules) for alleged insulation work at a cold storage, from a member of the Liverpool Master Builders' Association.

Mr. B. B. Moss, on behalf of the Liverpool Master Builders' Association, and with the consent of the operatives, appealed to the Board for a correct interpretation of the rule in dispute, which he contended would settle the case in point, and in addition would prevent friction arising thereunder in the future. This the Board were unable to do, although several votes were taken.

The case in dispute was then considered, and the witnesses were recalled to give evidence. On behalf of the firm, and in reply to a question from the chair, Mr. B. B. Moss admitted that from July 23rd the firm's workmen were working in a room where insulating materials were being used, owing to the floor above having from that date been broken through, and consequently making practically two rooms into one. The witnesses again retired, and the Board gave their decision as follows:—"That the workmen employed by the firm and working in the same room where insulating materials were being used, be paid 6d. per day extra as from July 23rd, until the completion of the new floor above."—James Denver, employers' secretary.

Lancashire, Cheshire, and North Wales Federation.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Federation Board-room, Manchester, on Friday, October 8th, the president (Mr. W. Cooke, jun.) in the chair.

The minutes having been read and confirmed, the secretary gave his report thereon.

Communications were read from local associations regarding their subscriptions, and the secretary was instructed how to reply thereto.

The secretary reported that owing to the very small attendance of local secretaries at the meeting called for September 29th, no discussions had taken place. It was decided that no further conferences should be summoned until there was a likelihood of more interest being shown in the proceedings.

Consideration was given to a notice received from the Birkenhead Association to amend Rule 4 of the Conciliation scheme. This notice had been before the Executive Board at their quarterly meeting, and by them was referred to the secretaries' conference for consideration and report, but owing to the small attendance thereat nothing had been done in the matter. After some discussion it was decided that the proposed amendment be sent up to the Northern Centre Executive for their consideration, without comment.

The meeting then proceeded to consider the question of "Delayed Payments for Contracts," referred by the Executive Board to this Committee, with instructions to draft proposals to submit to the various trade committees and local associations. A lengthy discussion took place, and it was ultimately agreed to refer the matter to a small subcommittee to consider and report thereon.

The secretary brought before the meeting correspondence which had taken place between the secretaries of the Bury and Rochdale Local Associations regarding the inter-trading rule, and he was instructed how to deal therewith.

Mr. James Higson called attention to the Government schedule of prices for daywork, and stated that, as he understood, the list was at present undergoing revision; and seeing that the prices allowed were below cost price, hewas of opinion that strong representations should be made by the National Federation to His Majesty's Commissioner of Works to have the schedule so amended as to be fair to the employer. It was agreed to refer the matter to a sub-committee consisting of the chairman of each branch trade committee.

The quarterly meeting of the Stonemasons' Trade Committee was held at the Boardroom, Manchester, on Thursday, October 28th, Mr. William Deakin, Manchester, presiding over a good attendance of representatives from the federated towns.

The chairman reported what was being done with regard to making suggestions to the revision of the Government price schedule for daywork, and a long discussion ensued.

The question of the importation of worked stone into a higher paid district was also considerably discussed, but no formal resolution passed.

It was agreed to hold the next quarterly meeting at Bolton.

Other matters of branch trade interest were discussed, after which the members retired to the Victoria Hotel for tea, on the kind invitation of the Manchester Master Masons. A hearty vote of thanks was accorded to the Manchester members for their hospitality.—John Tomlison, secretary.

ALTRINCHAM, SALE, AND DISTRICT ASSOCIATION.

Secretary: W. Moody.

The annual general meeting of the Altrincham, Sale, and District Association was held at the secretary's office on Wednesday, October 20th, Mr. James Hamilton, the president, in the chair.

The Secretary read the eleventh annual report, in which it is recorded that, "During the year efforts have been made to come to a settlement with the operative carpenters and joiners on the question of the working rules, but so far without success; the point at issue being the determination of this Association to meet local operatives only, whereas the employees have expressed their

determination to negotiate only through their Manchester Executive. It is the committee's intention to lay the facts before the Lancashire, Cheshire, and North Wales Federation, and ask them to take the matter up.

"One or two small complaints have been received from the operative bricklayers' and plumbers' societies, which, on being brought to the notice of the employers concerned, have been satisfactorily arranged, being principally matters concerning the employment of apprentices, and in connection therewith the committee would again impress upon the members generally the desirability of having their apprentices properly bound as soon as possible after their entering their employment.

"Owing to the serious illness of the treasurer, the secretary presented the balance-sheet, which showed total receipts £77 19s. 5d., and payments £78 7s. 9d. During the year the sum of £200 had been invested in Lancashire and Yorkshire Railway stock, and the balance in the bank after paying the purchase money was £29 16s."

At the meeting at which the report was presented, the President referred to the very satisfactory state of the finances, and regretted the serious illness of the treasurer (Mr. Drinkwater), who had been connected with the Association since its inception; and, on the chairman's proposition, it was resolved that the secretary convey to him the deep sympathy of the members generally, and expressing a sincere wish for his speedy recovery.

The president was again unanimously reappointed, and thanked the members for their confidence, and trusted that the coming year would be a successful one, and that trade would improve.

A hearty vote of thanks to the president, vice-president, and committee for their services during the past year concluded the business.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of Barrow-in-Furness Association was held on October 26th, and was well attended.

The case of one of the members v. the insurance company with which the whole of the members were insured last year, was discussed, and it was decided to instruct the solicitor to arrange with the company.

The Secretary was instructed to write a prominent firm in the town calling attention to the association's rule regarding the giving of quantities when asking for tenders amounting to over £30.

It was resolved to requisition the railway company for better telephonic communication in respect to the receipt of materials.

Approval was given to the circular submitted setting forth terms of advances to be given to apprentices for success at technical classes.

Two new members were proposed to be balloted for at next meeting.

BOLTON AND FARNWORTH ASSOCIATION.

Secretary: J. R. Vose, F.C.I.S.

The quarterly meeting of members of Bolton and Farnworth Association was held on Monday evening, October 25th. Mr. T. E. Coope, vice-president, occupied the chair in the absence of the president (Mr. B. Talbot) through indisposition, and nearly fifty members were present.

The secretary presented the quarterly report of the Committee, which was approved.

It was agreed to adopt the following new rule:—"That members should not sign any contract which contains a clause to maintain the works which have been executed, for a period of over twelve months from completion," and further to adopt the following "Form of Estimate" when tendering for work:—"My (our) estimate for the execution of the several works required in   is the sum of £   . This estimate, however, shall not by acceptance constitute a contract, but is subject to the preparation and approval of a formal contract to be signed by you and myself."

Mr. Frank Woods, the representative of the association to the Lancashire and Cheshire Federation, gave his report for the quarter, and a very interesting discussion took place on the subjects named therein.

It was decided to refer the reprinting and revision of the rules to a committee.

The secretary gave a report on the recent Conference of Secretaries held at Leeds, giving an outline of the various points which had been given in the papers that were read, and the same was approved.

A welcome was given to the Horwich contractors, who had expressed themselves willing to join the association, and who attended in fair numbers, the chairman expressing the hope that by the added strength to the local association, and, further, the benefits they would receive by using the machinery of the larger Association, the benefits derived would be mutual. Messrs. Slater, Makinson, and Ware, replied to the resolution, and expressed themselves as being ready to assist in every way they could to extend the working of the association.

It was decided that the association should in future be known as the "Bolton, Farnworth, and Horwich Building Trades Employers' Association."

Other matters affecting the trade were discussed.

BURNLEY AND DISTRICT ASSOCIATION.

Secretary: G. Astwood.

The annual meeting of Burnley and District Association was held in the Coffee Room of the Mechanics' Institute on Tuesday, Oct. 26th, Mr. Saml. Smith in the chair.

The Federation reports were read and commented upon.

The Secretary presented the balance-sheet for the year, which shows a balance in hand of £5 9s. 3d. The balance would have reached £11 had there not been some extraordinary expenses, which can hardly occur again, and a gain of £2 over the year previous would then have been shown.

The accounts having been passed, the officers for ensuing year were then elected.

Mr. Robt. Smith proposed, and Mr. Durtin seconded: "That the out-of-pocket expenses of representatives attending the trade committee meetings be paid by the association.

The Secretary brought before the meeting the report of the Journal Committee in respect to the official organ, the "Builders' Journal." The president (Mr. Smith) spoke in high terms of the matters dealt with by the journal, and strongly advised all members to become subscribers.

A note from the Bolton Association was read with respect to tenders for a certain building extension at Bolton.—Mr. Schofield proposed, and Mr. Wiseman seconded, "That this association do all they can to support the Bolton Association."

Mr. Harrison asked for the opinion of the meeting in respect to the Joiners' Association and the Builders' Association, the former having framed rules of their own which clash with those of the builders. After some discussion, Mr. Harrison proposed, and Mr. Dean seconded, "That a special general meeting be called on November 16th to consider the question of the future working of this association and the joiners.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The monthly meeting of the Master Plasterers' and Painters' Branch of Manchester, Salford, and District Association was held on Tuesday, October 12th, when Mr. James Cadman presided over a well-attended meeting.

The committee reported on their interview with the plaster partition manufacturers with respect to the suggested working agreement for the fixing and finishing of partitions, and after some considerable discussion, and with one or two slight amendments to the draft agreement, the same was agreed to subject to confirmation by the manufacturers.

Mr. J. Higson raised the question of the Government price list for daywork done under His Majesty's Commissioners for Works, and a lengthy discussion ensued, but no formal resolution was passed.

The monthly meeting of the General Committee was held at the Association Boardroom, on October 21st, when the president (Mr. Samuel Gerrard) presided.

The accounts as presented by the secretary were passed for payment.

Five new members were elected into the association.

The question of carrying out the resolution passed at the annual general meeting regarding the inter-trading rule was down for further discussion, but, in view of several matters at present pending, it was agreed to postpone the same until the next meeting.

The question of municipal trading by the Manchester and Salford Corporations was again discussed, but, in the absence of any definite information, it was decided to drop the matter for the present.

In accordance with instructions given at the last meeting, the secretary presented an estimate of the cost of supplying each member of the association with a copy of the Journal under the resolution passed by the National Federation some time ago. After consideration, it was resolved to authorise the secretary to write again to the members urging them to become subscribers to the Journal.

The Master Builders' Committee met at the close of the above meeting to receive the report of the deputation appointed to interview the Architects' Society regarding the questions of (1) Builders' discount on P.C. sums in quantities; (2) The period of maintenance; and (3) Time limit for the settlement of contracts. The president stated that the Architects' Committee had agreed to lay the matter before their members, and write informing the association of the decision.

The Stonemasons' Branch of the association held their usual monthly meeting on Thursday, October 28th, when matters of general trade interest were discussed.

The branch afterwards entertained the Stonemasons' Trade Committee of the Federation, who were holding their quarterly meeting in Manchester, to tea at the Victoria Hotel.

WIGAN AND DISTRICT ASSOCIATION.

Secretary: R. Hollows, Chartered Accountant.

The monthly executive meeting of Wigan and Dis. Association was held at the Clarence Hotel, Wallgate, Wigan, on Tuesday, October 19th, when the president, Mr. Wm. Webster, presided over a good attendance of members.

Several applicants for membership were admitted.

Mr. Robert Hollows, chartered accountant, tendered his resignation as secretary, which was accepted with regret.

The association has been for some time past endeavouring to get the members of the building trade in Hindley and district to join forces with them, two or three of them being members at present, while the great majority would not come in. Two meetings have been held at Hindley, at which new members have been enrolled, and it is probable that the majority of those still remaining outside will join in the near future. The trade in that district has been in a very bad state for some years past, and the lack of organisation on the part of the employers has hindered rather than assisted the matter.

The association has given notice of alterations to present working rules with the operative plumbers, and with the operative painters, and has received notice from the operative joiners.

The variations embodied in the notice to the operative painters' society are as follows:—Hours of labour: The starting time of work in the summer months to be at 7.30 a.m. instead of 6 a.m., and the men are to be at the boundary at 12 noon on Saturday, instead of at the shop. Breakfast to be had before commencing work all the year round.

The following new rule has been added to the above rule: "Any employer having a shop beyond four miles radius from the Wigan Market Place, and taking a job in Wigan and district, shall comply with the rules of the Wigan employers. Should any employer require his men to travel by train or tramcar to a job within a four miles' radius, the workman, on payment of the return fare by the employer, shall travel by car or train, leaving the terminus or station at the first time immediately preceding the starting time of work. With respect to the railway train or car, this clause to apply only to those starting within twenty minutes preceding the starting time. With respect to meal hours and starting times for country jobs, a joint agreement between the employers' and employees' societies may be made to fall in with the running of the trains." Country work: This rule remains as it was, except that the radius within which an employer has the option of paying wages on the job has been decreased from five miles to four miles. The following new rule has been added to the above rule: "And should a Wigan employer have a job exceeding four miles from the Wigan Market Place, he shall be at liberty to start men on the job."

The variations embodied in the notice to the operative plumbers' society are as follows:—Working hours in summer months to be 49 hours per week, instead of 54½ hours as at present, and for the winter months, 44 hours per week instead of 47. The winter period has been extended from November 12th to February 6th, to the period from November 1st to March 1st—an increase of five weeks.

The following clauses have been inserted in the rules, viz.:—"Workmen, if requested by the employer, must start at the Wigan Market Place, and leave by the tramcar or train nearest the first starting time. Employers to have the option of engaging men on the job on similar conditions to those allowed to employers from other towns." The "country job" rule has been amplified by the stating of certain boundaries for the several districts, and the starting places have been fixed at these several places for outgoing workmen. On Saturday, incoming men shall be at the boundary by 12 noon, instead of at the shop, as formerly.

The variations embodied in the notice received from the operative carpenters' and joiners' society are as follows:—Wages to be 10d. per hour instead of 9d. Overtime is to be paid at the rate of 1s. per hour for the first four hours, instead of 10d. for the first five hours, as at present; and afterwards at double time (1s. 8d. per hour), instead of 1s. per hour as at present, until the next starting time, and including Saturday after 12 noon. The five hours "overtime" are now computed after working a full working week, but the notice has eliminated the words to that effect. During August Bank Holiday (building trades holiday), the rate of pay is to be 1s. per hour, instead of 10d. as at present. The payment of wages to commence at 12 noon on Saturdays, instead of "not later than 12.15 p.m.," or, in the case of men leaving or being discharged from the employ, at the termination of the legal notice. Starting time: The clause whereby on a job, within a 3½ miles radius, "the workmen must, on payment of the return fare by the employer, travel by the car or train leaving the terminus or station at the first time immediately preceding the starting time of work," has been altered to the starting times stated in Rules 1 and 2. Outside jobs: The following addition has been made to the present rule:—"All workmen on outside jobs to cease work in time to be at the shop at 12 noon on Saturdays, even though wages are paid on the job, and in such case wages must be paid either before or immediately after the men cease work." Country jobs: Employers are to be allowed to start men on the job when such job exceeds three and a half miles from the shop, and not the Wigan Market Place as at present.

The concessions allowed to the employers in the piecework and prepared woodwork rule last year have been deleted, and the limitation of apprentices, which only came into operation for the first time on May 1st this year, and which now stands at 1 apprentice to 2 workmen, has been increased to 1 apprentice to 3 workmen. The arbitration rule has also been amended in the notice.

The annual meeting is to be held on Thursday, November 18th, when the appointment of officers for the ensuing year will be made.

Yorkshire Federation.

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Bradford Association was held on October 26th, Mr. T. E. Taylor, president, in the chair.

The treasurer presented statement of subscriptions received, and an account was presented for payment and duly approved.

In view of the present condition of trade, it was deemed inexpedient to give any notice to the operatives for alteration of working rules. The chairman gave a very interesting account of the recent meeting of the Yorkshire Federation, and the discussion ensuing thereon was of considerable interest and profit.

A committee was appointed to meet the master plasterers with respect to the appointment of the employers' representatives on the joint committee provided for in the revised agreement with the plasterers.

The sub-contract form as submitted by Mr. Hope for the consideration of the Yorkshire Federation was considered clause by clause, and a resolution was unanimously passed approving of the form as now submitted.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

A general meeting was held on October 12th. Mr. O. Mawson, vice-president, occupied the chair, and was supported by several members. The secretary was instructed to approach the secretary of the Master Plasterers' Association with respect to the apportionment of employers' representatives on the joint committee provided under the revised plasterers' agreement.

The Operative Bricklayers' Society had called the attention of the association to works on which a member was alleged to be permitting masons to execute work usually done by bricklayers. The member in question had written to say that the matter was only a trivial one, but now that his attention had been called to it, he would see that it was duly remedied.

The treasurer's report was presented, and several accounts were considered and ordered for payment. The minutes of the Yorkshire Federation were considered, and the matters of interest arising thereon were thoroughly discussed.

Officers were nominated for the following year, and the date of the annual meeting was fixed for November 16th.

A meeting of the General Committee was held on October 20th, when it was decided, after careful consideration, to give the masons, bricklayers, and labourers notice for alteration of winter working hours, with a view to work being commenced after breakfast, and thus avoid an early break after commencement of work. It was also decided to give notice for an addition to the rules to provide that the party receiving notice shall be at liberty within fourteen days of receiving such notice to send in a counter-notice. Both these alterations had been informally discussed with the operatives at the annual meeting of the local Conciliation Board, and from the conversation which ensued the members gained an impression that the alterations would meet with the acceptance and approval of the operatives' societies.

During the municipal election campaign, several references have been made to the Works Department of the Leeds Corporation, and the secretary was instructed to write a letter to the local Press, stating the satisfaction of the members at the increased volume of work which had been let by contract during the past year, and expressing the hope that this procedure will be still further extended.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

An executive meeting of the York Association was held at the Old George Hotel, Pavement, on Thursday, October 28th. The Lord Mayor of York (Alderman J. Birch) presided over a good attendance.

The chairman mentioned the decease of Mr. J. Hobson, who had been a valuable member of various committees. A resolution of sympathy with the widow and family was carried, and the secretary was asked to send a suitable letter of sympathy to the relatives.

The question of inviting the Federation to hold their next meeting in York was mentioned. The president said he would be glad to place the city council chamber at the Federation's disposal, and, on behalf of the Lady Mayoress and himself, to invite the delegates to take tea with him at the Mansion House afterwards. It was afterwards found impossible to invite the Federation next month, and, the December meeting always being held in Leeds, the secretary was instructed to write to the Yorkshire Federation secretary inviting the Federation to hold a meeting in York on a suitable date early in the new year.

The sub-contract form, as re-drawn, was carefully considered in detail and approved. It was suggested that if a hard-and-fast agreement were to become general, a clause might be inserted giving a sub-contractor the right to be present with the surveyor on completion, and measure up his sub-contract work. It was suggested that the matter might be raised at the next Federation meeting by our delegates.

The secretary reported that no local branch of master plasterers was now in existence, and the masters' section of this committee would therefore be appointed solely by the local builders' association. Mr. Biscomb proposed, Councillor Mansfield seconded, and it was unanimously resolved that the secretary should write to the secretary of the Operative Plasterers' Society that this association considers four representatives on each side a suitable number, and that if they agree to this number the joint committee be so constituted, with Messrs. J. R. Cram, T. Morris, G. Rawling, and G. Young as the masters' section.

With respect to Federation subscriptions and the National Reserve, correspondence on this subject received since last meeting from the Yorkshire Federation was read, and it was reported that the current subscription had been already forwarded; but with regard to the National Reserve it was resolved that we forward a further subscription before next meeting. Mr. J. W. Biscomb moved that the matter be put on the agenda for next meeting with a view to arrangements being made for a further collection for the Reserve Fund, which it was important should be well supported. The motion was carried unanimously.

The draft model of a fair wages clause in contracts, as approved by the National Administrative Committee, was read and discussed, and unanimously approved.

It was resolved that (in order that the representatives to the Federation for 1910 should be appointed in time to report for the Federation's December meeting) our next executive be held on November 30th next, at which nominations should be made; the representatives to be elected at the annual meeting, to be held the week following, viz., December 7th.

The secretary made his report with respect to advertisements on the local calendar, and Mr. W. Biscomb proposed, Mr. J. W. Biscomb seconded, and it was carried unanimously, that the secretary be empowered to make all arrangements for the letting of spaces for next year.

The question of papers or social meetings was ordered to be put on the agenda for further consideration next month.

Northern Counties Federation.

SOUTH SHIELDS ASSOCIATION.

Secretary: J. G. Robertson.

The annual meeting of the South Shields Association was held in the Victoria Hall on Tuesday, October 26th, Councillor J. T. Armstrong presiding over a representative attendance.

Mr. A. Ross (hon. treasurer) presented his annual balance sheet, from which it was shown that the branch, despite heavy calls, is in a strong financial position. After it had been moved and seconded, his report was adopted with acclamation.

The Secretary's report was mainly a review of the year's proceedings. It recounted the difficulties with the water company, with respect to their new by-laws, and the threatended conversion of the dry-earth closets into water-closets. It also touched upon the value of the inter-trading rule as already proved in the branch, the report urging that the rule should be put in force, and not allowed to remain as a mere recommendation. The question of unfair conditions of contract was referred to, and the value of the telephone card was emphasised. A passing reference was made to the stamp duty. A strong plea was made for all members to become subscribers to the "Builders' Journal," special emphasis being laid on its value to the Federation.

The membership had increased, and although the building trade had been in a very depressed state during the twelve months, the branch was in a very strong and flourishing condition.

After discussion, it was agreed, in view of the events that would take place during the next year in the town, that it was undesirable to make any change in the officers for the ensuing year, and they were accordingly reelected:—Councillor J. T. Armstrong, President; T. Anderson, sen., vice-president; W. V. Jary, junr., vice-president; and A. Ross, honorary treasurer.

The Chairman, on behalf of the other officials and himself, returned thanks for the honour of re-election, and pleaded strongly with all the members to take a more active interest in all the affairs of the branch, asking for a regular and loyal attendance at all meetings, without which it was impossible to carry on the work of the branch as it ought to be conducted.

On the motion of Councillor W. J. Robertson, seconded by Mr. J. J. May, a hearty vote of thanks was accorded to all the officers for their valuable services during the past year.

Representatives were then elected to both the Northern Counties and Blyth and Tyne Federations.

A long discussion, initiated by the secretary, ensued, re the best method to get all members to subscribe to the "Builders' Journal." It was agreed, by the adoption of an amendment to a motion, that every member be circularised that he can now get a copy of the "Builders' Journal" at 5s. per annum, the remainder of the subscription coming out of the branch funds.

It was resolved to hold the annual whist drive and dance in December, and the former committee were re-appointed to make the necessary arrangements. Another effort is to be made to induce the four or five builders who are not members, to become members.

A recommendation was made from the meeting to the Tyne and Blyth Federation to put the inter-trading rule into active operation. It was believed that it would be better done by the Federation than by the branch acting alone.

Two new members were elected.

An effort is to be made to secure a permanent meeting place for the Association.

The Newport Association have fixed the date of their annual dinner for December 14 next at the King's Head Hotel, at 6.30 p.m. Tickets may be obtained of the Secretary, Mr. Richard Richards, "Mount Eveswell," Newport.

Midland Centre.

COVENTRY AND DISTRICT ASSOCIATION.

Secretary: W. Ivens.

It having come to the knowledge of Coventry and District Association that the City Council had decided to hold monthly meetings instead of fortnightly, and it being inferred that consequently building plans would only be considered monthly, the following letter was sent, with the result that a Plans Sub-Committee is to be appointed to meet fortnightly, and to notify builders when their plans have been approved or otherwise.

The letter, which is signed by Mr. Charles Garlick, president, and by the hon. secretary, is as follows:—

"We understand it is proposed in future that plans for buildings, etc., will only be approved once a month. May we be allowed to point out to you that this will cause great inconvenience and loss, not only to contractors, but to anyone erecting new buildings, especially workshops or factories. It is often found, in dealing with old buildings, that first plans for various reasons cannot be carried out, and amended plans have to be submitted after the work has been commenced; and to be compelled to wait a month for approval would be a great inconvenience. It sometimes occurs, in dealing with property in the older parts of the city, that nothing is known with certainty of the position of drains. Plans are prepared, and work begun, only to find that the main drain is somewhere else, and in consequence amended plans have to be approved. To wait a month in such cases would be impossible. We respectfully beg that plans will be inspected for approval at not longer intervals than once a fortnight."

NORTHAMPTON ASSOCIATION.

Secretary: A. L. Airs.

The annual dinner of the Northampton Master Builder's Association was held at the Peacock Hotel, and was a very successful gathering. The president (Mr. R. W. Harris) was in the chair, and among the guests were the Mayor (Councillor J. Brown), and Councillor H. Martin, J.P.

After the loyal toast, given by the chairman, Mr. A. Smith submitted "The Mayor, Magistrates, and Corporation."

The Mayor, in responding, remarked that the town was one of the healthiest, and he thought one of the best conducted, and they wished to attract people to reside in the town who had made money, and he hoped the building trade would have a busier time than for years past.

Councillor H. Martin, J.P., also replied.

Mr. Henry Green, submitting "The Architects," suggested that architects should only ask for bills of quantities from successful competitors, and should seal the quantities up till settlement, and not let them lie about in their offices for everyone to see.

Mr. J. A. Piccaver said he always made a practice of sealing tenders until one was accepted, and thought that was the general practice.

Mr. John Brown, jun., said the architects had to face a difficult problem. The client wanted a £2,000 job done for £1,000, and the builder wanted £3,000 for it, and the architects had to make boths ends meet. The architect had no use for the quantities. He also disliked the idea of deposits from builders for quantities. Mr. Frank Allen thought the builders' associations were strong enough to over-ride the architects if they tried on the quantities point.

Mr. S. S. Redwood, of Luton, proposed "Success to the Builders' Association." The success of the building trade depended on the success of the other trades, and he hoped and believed trade was getting better.—The President replied.

Mr. W. Heap welcomed "The Visitors," and Mr. J. F. Stops, Mr. J. Molde, and Mr. H. Hall, made acknowledgment.

Mr. J. J. Martin gave "The President," and eulogised Mr. Harris's services to the association, and the Chairman replied. He appealed to the younger men to attend the meetings.

Mr. Harris referred to Mr. Amphlet's visit when he attended Northampton to enlighten the association on the use and working of a local conciliation board.

Mr. John Bird gave "The Vice-president," and Mr. A. M. Dunham acknowledged.

The other toasts were "The Secretary," proposed by Mr. Archer, and acknowledged by Mr. A. L. Airs, who referred to architects opening quantities of unsuccessful competitors. He said that a circular on the subject would be sent to all the local architects.

Following is the copy of a letter received from one of our members and addressed to the president of our association:—

The Chairman, Builders' Association,

"DEAR SIR,—I am sorry I cannot attend the meeting to-night, as I wished to report personally a case respecting the exemption clauses for vehicles used for business purposes.

"Last Saturday, one of my vans was stopped coming into town, when bringing men from a country job. The van was examined and comment made that there were no goods in the van. On Monday I received a visit from the police, who asked me a number of questions and told me that they *caught* our man bringing the van into Northampton with a load of men, which was contrary to the law relating to the licensing of vehicles. Naturally I was astonished, as we are constantly sending men to jobs and bringing them away. I am told I am liable to a fine, and that the exemption clauses only relate to vehicles that are delivering goods. I think this will be news to all of you, as this does not affect me alone, but everyone connected with the building and decorating trade, and also other trades. If this is the interpretation of the law, and it were necessary in our case to send men out with the goods to fit up, say, 10 or 15 miles in the country, and, having delivered these goods, we may not in an unlicensed vehicle bring the men back again!

"I asked the police why they take me as an isolated case, when they might find so many others, and I understood that they *caught* one or two others, and doubtless would catch others later on. Naturally I resent this term *caught* very much, and I think you will, too. It does not speak much for the police force if this Act, which has certainly been in existence 20 years, has not produced more cases of this kind.

"In mentioning the case to the society, I am quite sure you will give it careful consideration.

"I have not received my summons yet, but will notify your chairman as soon as it arrives."

Scotland.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Secretary: James Cameron, Solicitor.

The monthly meeting of the executive of Edinburgh, Leith, and District Association was held in the Building Trades Exchange, 61, Lothian Road, Edinburgh, on Thursday afternoon, October 28th. The minutes of the previous meeting having been adopted, the secretary proposed Mr. John Hay, builder, and Messrs. Forbes and Co., roofing contractors, for membership, and they were duly admitted.

The report on the state of trade showed it to be about the same as last month, and if anything, worse than last year at this time.

Some discussion took place as to a reduction in wages in the several branches of trade, and the secretary submitted reports he had received from Glasgow, Aberdeen, Dundee, Inverness, Paisley, Oban, and Dumfries as to the rates of wages and probability of a reduction in these towns. It was agreed to postpone further consideration until the Executive meeting in December.

Messrs. J. M. Scott, and J. D. Burn were appointed as delegates to the National Registration of Plumbers.

A design for a crest for the Scottish Building Trades Federation was submitted and approved.

The secretary communicated several points of interest arising out of the National secretary's report to September 30th, particularly with regard to the arbitration clause in conditions of contract, and the recent legal decisions arising thereunder. He also reported on the international facilities for students.

The annual dinner was fixed for Tuesday evening, December 7th, to be held in the Royal British Hotel.

The secretary referred to the policy of the Leith School Board in connection with the two schools now being erected for that body. It appears that some time ago they decided to have these schools built on the Doeker principle, and sent the order direct to Germany, without asking local (or even British) builders to tender for the work. As the whole question is one which affects the Edinburgh and Leith building trade in general, and those members of the trade who are ratepayers in the Burgh of Leith in particular, a joint meeting of the Building Trades' Association and Building Trades Exchange was arranged, in order to consider the whole matter, and to take such steps as might to deemed proper and expedient.

Late Reports.

MIDDLESBROUGH ASSOCIATION.

Secretary: Walter Rigby.

The monthly general meeting of the Middlesbrough Association was held in the Corporation Hotel on Wednesday, November 3. The president took the chair, presiding over a fair attendance of members

A letter was read from Mr. W. H. Hope, in reference to the publication of a Northern Counties' Federation year book. The letter explained "that the book would contain among other items of interest to the building trades, the lists of officers and members, also the rules of the local Associations in the Northern Counties."—The proposal met with hearty approval, and it was decided to purchase a copy for each member of this Association.

It was decided to hold the annual meeting on Wednesday, December 15th. Following the meeting a "smoker" is to be held, at which a presentation to Mr. C. Griffiths will be made. Mr. Griffiths has rendered valuable services to this Association. For several years he held the secretaryship, and on resigning that office took up the duties of treasurer, which position he held till May this year

It is with very great regret that we record the death of Mr. Henry Allison, senior partner in the firm of Messrs. Allison Bros., builders and contractors, Middlesbrough. Messrs. Allison Bros. have been in business in Middlesbrough for just over forty years, and were among those who about 12 years ago founded this Association. The firm has always been at the service of the Association in the promotion of builders' interests. The junior partner, Mr. T. Wilkinson, has seen much Federation service, and is president of the Northern Centre Conciliation Board. The funeral of Mr. Allison took place on Monday, November 8th. Mr. J. Davison (president), Mr. W. H. Hope (secretary), Northern Counties' Federation, were present; also Mr. T. Brown, Mr. W. Johnson, Mr. Alcock, Mr. W. C. Creasor, of Stockton, Mr. W. Masters, president Middlesbrough Association, and many Middlesbrough builders.

NEWPORT (MON.) ASSOCIATION.

Secretary: R. Richards.

His Worship the Mayor, Councillor Wm. Blackburn (ex-president of the Association, and a member of the National Council, and past president South Wales Building Trades' Federation), invited his colleagues of the above Association to take part in the Mayoral procession and Divine service on Sunday, November 14th, at St. John's Church, Maindee, Newport, the Association being given a place in the official programme of the procession.

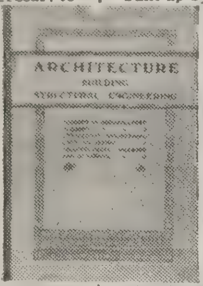
It is Surprisingly Easy for the ambitious man or woman to qualify for a highly-paid position



It is not necessary to attend a technical school. It is not necessary to lose one moment from your day's duties. It is not necessary to interfere with your engagements. It is not necessary to buy text-books or apparatus. It is not necessary to have a private tutor or "coach."

The International Correspondence Schools will teach you the science, the theory, the practical reasons of your chosen line in your own home, your own time, practically on your own terms—and the Course will include all the books, papers and outfits you need.

That the I.C.S. is able to do these astonishing things is the result of 18 years of successful concentration. The Courses have been prepared at an expense impossible to any but an Institution made prosperous by the prosperity of its students—built up by the recommendations of those many men and women who have reached higher places and bigger salaries through its thorough training.

All we ask is, if you aspire to control, rather than be controlled—that you let us send you free information and some of the letters which both students and employers have written us voluntarily.

Simply send a postcard. Mention the business or professions in which you are interested and in which you desire to advance. The I.C.S. Students' Aid Department puts graduates in touch with employers, free.

Builders' Quantities.

The recent discussion by the London Master Builders' Association on the subject of Builders' Quantities, has aroused feeling in a quarter from which one would least expect it. The grievance of the builders, to which we drew attention in our issue of October 20th, is a very acute one in these days of keen competitive tendering. If architects refuse to supply quantities to the builders, those quantities must be taken out by the builders themselves, and at their own expense. If there are fifteen builders tendering under such conditions, only the successful one can get back the cost of quantities from the client; the other fourteen incur a dead loss, which goes to swell their establishment expenses. It is against this imposition that the builders complain, and not without good reason. Yet our contemporary "The Builder," whose title would lead one to expect sympathetic consideration of this matter, pooh-poohs the grievance, sneers at the "hardship" which Mr. Godson enunciated, and finds the purely academic discussion of the master builders one of "some bitterness." We are told that quantities are nothing to the architect or the client; that they have no interest in "how many thousand bricks are used" in a wall, "or what is the length in foot run of a cornice." This is only a half-truth. The ultimate aim of both the client and the architect is to obtain a building "of a special design, dimensions, and materials" without doubt; but as the client has to pay for the materials, and the architect to see that he gets them, neither can afford to disregard any one of the essential processes by which the building is produced. Moreover, as both clients and architects frequently desire to vary the "special design, dimensions, and materials" of their buildings, they cannot well ignore the one document that gives them the opportunity of doing this on terms that shall be equitable to all three parties to the contract. The admission that "the system of competition tendering is at the root" of the necessity for quantities, and that "as long as this system is general the position must probably remain unaltered," is only another way of saying that we are now in the twentieth century, which brings its own special crop of difficulties requiring solution. This matter of builders' quantities is but a small matter, an incident in the progress of modern building operations, and mainly confined to the South of England. It is in no sense revolutionary or any object for heat and denunciation, nor has it been regarded by the builders as more than one of those subjects upon which they might approach the architects in friendly conference, in the same way that the national form of contract was discussed and drawn up. "We can hardly suppose," says our contemporary, "that a builder who had taken out quantities in order to make an estimate, would omit to add something to the estimate in consideration of that." Exactly; he does. But this fact does nothing to mitigate the losses of all the unsuccessful tenderers, and this is the whole bone of contention. The contractor asks that he shall be furnished with quantities taken out by an independent surveyor employed by the client. This places him on an equality with all the other builders tendering; it prevents mistakes and avoids the unnecessary and uneconomical duplication of labour. If, as "The Builder" suggests, the successful contractor makes his client pay the cost of preparing the quantities, the client is no loser by having them prepared beforehand, except as to the insignificant extra cost of duplicating the quantities for the various builders who desire to tender. We are quite sure that any builder would be prepared to pay the shilling or two which is the intrinsic cost of the copy handed to him. He is quite content to "drive off into the hands of a surveyor a little bit of business" because "the legitimate profit" he makes on quantities in contracts he secures is swamped many times over by the losses accruing in the more numerous cases in which his tender is unsuccessful.

Another Garden Suburb.

It must be a sore trial to garden city enthusiasts that their beneficent aims and programmes are so often clipped and shorn by the exigencies of the money question. Enthusiasts are seldom blessed with means sufficient to encompass their desires, and consequently their ideals are almost inevitably subjected to the wiles of the mere commercial person. "Garden City" is an alluring title that conjures up visions of white buildings with spires and domes that glisten under the sun against backgrounds of green and an azure sky; whereas the result so often is an improved form of cottage housing set out on roads of the ordinary suburban kind. For by the time the land is purchased and laid out, the funds of the enthusiasts are exhausted; the land must be leased and the lessees are rarely men who will embark on a grandiloquent building scheme for the mere sentiment of the thing. Consequently the grand boulevard fails to rise above the level of a suburban street; the shopping centre lacks the attractiveness of, say, Regent Street in London, or Princes Street in Edinburgh; and the civic centre bears a close resemblance to the civic centres of those land-boom cities of the Western States of America. A report in the daily Press gives one hope, however, that a new garden suburb, to be commenced immediately at Winchmore Hill near Enfield, will be carried through without these difficulties. The arrangements sound most promising. The estate, of some 300 acres, is ringed round with country lanes, and is heavily timbered. Not a tree is to be cut down except where actually necessary for the making of roads and the erection of houses. A central park is to be provided for the inhabitants; the old mansion will become a club, and the lake of eight acres will be kept for boating, fishing, and swimming. Fences will be prohibited; all divisions being marked by shrubs. The houses will be designed by the best architects, the cheapest to cost £550, and the estimated capital required, £2,000,000, is apparently available. It really looks as if house building was at last getting into enlightened hands, and we shall await, with interest, further particulars of the scheme.

Builders and the Budget.

The following paragraph has been circulated in the daily Press: "A representative meeting of builders from all parts of London has carried a resolution of protest against the Increment Duty, the Undeveloped Land Tax, the Reversion Duty, and the increased Stamp Duties in the Budget. The resolution has been forwarded to the House of Lords. The builders also decided to bring into existence a Federation of Master Builders and Workers in the Building Trade to watch over the interests of the trade generally, and all builders and their workers were invited to join." The announcement might, or might not, have more force if it were less vague. The absence of definite particulars makes it an example of reticence which we have no option but to follow. It seems necessary to point out, however, that there is one respect in which the paragraph may be misleading. The statement that it has been decided "to bring into existence a Federation of Master Builders and Workers in the Building Trade to watch over the interests of the Building Trade generally," cannot be allowed to pass unchallenged. It calmly ignores the fact that a Federation of very similar title, and whose objects might be expressed in identical terms, has long been in vigorous being. To prevent very possible confusion, it may be here stated categorically that the National Federation of Building Trades Employers of Great Britain and Ireland is in no way responsible for the circulation of the paragraph in question, and whether or not the majority of its members are in sympathy with the objects set forth—which is a separate question—has a right to object to this unauthorised use or imitation of its name. To those who are acquainted with the Federation, this disclaimer may be unnecessary; the suggested conjunction of incompatibles contained in the last line affording perhaps a sufficient hint that the proposed league must be a thing apart. The choice of a title is presumably provisional. It is also unfortunate, in so far as it appears to clash with the honourable style and title of the National Federation, which, as we have already stated, is in no sense responsible for the somewhat ambiguous announcement. Imitation is in this instance a somewhat embarrassing form of flattery.

Nottingham's Notable Example

An association of master builders, or any similar organisation, is in but little danger of losing sight of the objects for which it exists, and for which it was called into being. But such an organisation may "fulfil itself in many ways." The direct forward movement of most of the pieces on the board may be greatly aided by the knight's gambit. There are, it may be supposed, many ways in which an organisation may gain in influence and power by showing that it is not a mere machine, but a thoroughly human institution. This larger view is exemplified by the Nottingham Master Builders' Association, which is showing, in various ways, a keen interest in the technical education of the builder. Under its auspices, Mr. G. M. R. Layton, B.A., of the Associated Portland Cement Manufacturers, has delivered, at University College, Nottingham, a lecture on Portland Cement, the chairman on that occasion being Mr. Robert Evans, J.P., F.R.I.B.A.; later, under a joint invitation from the Association and the University College, Mr. William Dunn delivered a lecture on Reinforced Concrete, a subject on which builders are wisely anxious to obtain all available information. In each case the lecture was illustrated by lantern slides. Further, the Association offers a guinea and half-a-guinea as first and second prizes to those students of building construction who, being apprenticed to any of its members, obtain creditable positions in stages 1 and 2 of the Board of Education examinations, and of a guinea and a half, and half-a-guinea respectively for first and second prizes in stage 3. This seems to us to be an excellent way of encouraging apprentices to render themselves diligent and efficient; of stimulating the interest of employers in technical education; and of putting the Association in a favourable light before both masters and men, as well as in the eyes of an important section of the general public. It is, we think, a legitimate expansion of the scope of such associations, and we should be glad to see Nottingham's example generally followed. Other associations may be reminded that it is not copyright.

Subways and Civic Design.

It is announced that the Lord Mayor of London will open the Blackfriars Bridge subways next Monday. The subways will no doubt prove very useful to those to whom time is not dearer than life; and considering the notoriety of the significantly named "Slaughter Corner," the subways ought to diminish London's death-rate, and to relieve the congestion in the accident wards of adjacent hospitals. The potential utility of the subways is unquestionable. It does not necessarily follow that therefore they need not be made beautiful. The approaches, as we pointed out before the work was begun, afforded an excellent opportunity for decorative treatment. That opportunity seems to have suffered from what, to borrow a strictly Parliamentary phrase, may be regarded as frigid and calculated neglect. We are more pained than surprised to find that the exits and the entrances are simply oblong holes surrounded by plain railings. It is better, perhaps, that the railings should be kept severely plain rather than that they should have been contorted into hideous designs; but while grateful for this small mercy, we cannot help regretting that more encouragement has not been given to the Londoner's growing sense of beauty. Architects having time on their hands might employ it to less advantage than in designing appropriate architectural treatment for the approaches to subways; and if the results of their skill were put before the authorities, it is quite possible that we may yet get something which will add to the adornment rather than to the disfigurement of our streets. The burrowing underground may be purely a matter for the engineer; but the surface treatment (which should not be merely superficial) ought to be placed in the hands of the architect and sculptor. As the idea of civic design becomes more popular, it will dawn upon the authorities that the approaches to subways may be made to assist very materially towards the adornment of the streets.

The Housing Bill.

The safety of the Housing and Town Planning Bill was assured on November 19th, when the House of Lords, after a sufficient show of resistance to enable them to climb down with grace and with dignity, accepted the more important of the points upon which the Government most strongly insisted. This may be taken as a sign that the Bill, as a whole, if not exactly popular in the true sense of the word—for the man in the street is not greatly stirred by it—is yet sufficiently esteemed in influential quarters to render its rejection prejudicial to the case for the Lords that is shortly to be put before the country. The Lords, however, may be credited with having accepted the Bill on its merits, and thus to have fallen into line with the general opinion; for with regard to the main principles of the Bill, apart from details that will doubtless be modified as occasion demands when the measure comes into operation, one hears hardly a dissentient voice. That everybody seems anxious to give the measure a trial is, one is glad to believe, a sign of the awakening consciousness of our backwardness, as compared with other nations, not with regard to the minor question of housing, in which, in spite of our many imperfections, we can still show other countries a lead, but in respect of the larger and broader aspects of civic design. While congratulating Mr. Burns on the happy issue of his almost titanic labours in a field that he has made peculiarly his own, we cannot help adding that these labours might have been considerably lightened, and possibly rendered more fruitful, if he had not so strangely denied himself the help of those who were prepared to give unstintedly and disinterestedly of their skill and knowledge. The measure, when it comes into operation, will, we doubt not, reveal the absence of the professional aid that the R.I.B.A. were prepared to give in much greater abundance than Mr. Burns was prepared to receive it. Then the architects will be called in—as some folk call in the doctor—to apply desperate remedies for ills that might have been easily prevented at an earlier stage.

The Obliteration of Fleet Street.

Although it is not upon the records that Dr. Johnson ever said, "Sir, let us take a walk down Fleet Street," an exhortation of which George Augustus Sala acknowledged the authorship, one can never think of the "Highway of Letters" without mentally seeing Ursa Major as the principal figure in it. But already it is nothing like the Fleet Street that the Doctor knew and loved. It completely lost that character when Temple Bar was removed, and the egregious Griffin was set up in its place opposite the "New Law Courts," the clearance for which destroyed many a Georgian and Johnsonian relic. And now it is to be altered out of all recognition. The Court of Common Council has decided that the very necessary (and very gradual) widening process is to be continued, at an estimated cost of £436,238, towards which the London County Council will contribute £200,000 in yearly instalments of £50,000. This expenditure will, it is stated, "complete the improvement of Fleet Street." It will also complete its obliteration as the scene of one of the most fascinating epochs in English literature. But the widening was inevitable, and we shall become reconciled to it if only the new buildings are of such a character as to compensate us in some measure for the vanished glamour.

San Francisco Rebuilt.

The rebuilding of San Francisco, after the destruction by earthquake and fire in 1906, has proceeded, according to an ingenious calculator, at the rate of one building for every hour and forty-five minutes of time elapsed since the destruction. Building has, in fact, gone on continuously night and day; but it has been done with thoroughness, and with considerable regard for beauty as well as for stability. In particular, the municipal buildings are worthy of the city's position as the metropolis of the western coast. The city hall of justice, gaol, schools, and hospitals, have cost three millions sterling; and a further million is to be spent on the installation of a high-pressure water system for protection against fire. The new buildings are, it may be supposed, all constructed with a special view to the circumstances in which the former city was reduced to ruins. They are of several types, including steel frame with brick, stone, or terra-cotta (or a combination of those materials), and, of course, reinforced concrete How these new buildings would behave under a similar visitation to that which destroyed the old, we are not anxious to find out by the same means! and we trust that the pluck of San Franciscans may never again be put to so severe a trial as that from which they have so triumphantly emerged.

THE PLANNING AND LAYING OUT OF PUBLIC PLACES.*

By H. Inigo Triggs, A.R.I.B.A., Godwin Bursar, 1906.

Some five years ago two papers of considerable interest on the planning of cities and public squares were read in this room by Mr. John W. Simpson and Professor Beresford Pite. The papers, as the writers said, were intended to touch only upon the fringe of the subject and to induce further investigation.

The advent of the newspaper may be said to have abolished the principal reason for which the mediæval public place existed—namely, to hear and discuss the news of the day, and listen to the public proclamations. In like manner, since the gorgeous ecclesiastical ceremonies of the Mediæval and Renaissance church are things of the past, the great church places have no longer the same *raison d'être*.

A demand has arisen for new types of public places, for traffic places that shall effectively receive and distribute streams of vehicles with safety to pedestrians, for monumental and garden places that shall show to the best advantage the buildings that surround them, and for places that shall be useful at the same time for military parades, exhibitions or sporting purposes, sanded or turfed and surrounded by trees, such as the Champ de Mars.

Aviation is making rapid strides, and, as M. Hénard has recently pointed out, the necessity for trial grounds and alighting places will soon make itself felt. It may not be considered too visionary a suggestion that the day may be not far distant when perhaps Hyde Park itself will furnish the site for an aviation place, with gigantic sheds able to accommodate a fleet of dirigibles.

Turning to some of the more important points that may be learnt from a study of town planning in the past, the author thought that one of the first lessons to be learnt is the value of grouping buildings round definite and fitting centres. Sir Christopher Wren strongly emphasised the importance of this in making his plan for the re-building of London. He placed a spacious "rond-point" at Ludgate Circus from which eight streets were to radiate; a triangular space opening up the fine vista of St. Paul's Cathedral, a monumental place at the Royal Exchange, together with five other controlling places at important traffic junctions.

In classic cities the Agora and the Forum invariably formed fitting centres for the grouping of the principal public buildings, and in mediæval towns we always find the public places dominated by some great church or public building. The "Grande Place" at Brussels, with its Hôtel de Ville, the Market Place at Ypres, dominated by the glorious Cloth Hall, or the "Place Verte" beneath the spire of Antwerp Cathedral are all instances in point.

In re-planning Paris, Baron Haussmann and his successors fully realised that more depended upon the placing of structures than upon the structures themselves. Paris has perhaps the most glorious civic centre in the world in the combination of the Louvre and the Tuileries gardens.

In the United States, starting with the examples of Washington and Cleveland, the town planners within the last decade seem to have realised how grand the effect of buildings arranged in a stately manner may be, and that the advantages to be gained by grouping public edifices are not only æsthetic but also tend to convenience and to simplicity of administration and maintenance. Numerous cities are now engaged in formulating plans for civic centres on the lines of Washington and Cleveland, where they seem at last to realise how much of the effect of important buildings is lost when they are scattered indiscriminately about the town, as is the case with the finest public buildings of London, almost without exception.

In this country opportunities for the creation of large civic centres are not likely to occur often, yet each year the growth of our suburbs creates the need for secondary subsidiary centres which require quite as skilful handling as the larger ones. Even the smallest public buildings may be so grouped that they harmonise and help one another both by colour and scale, as in the scheme put forward by Herr Karl Henrici for providing a series of such focal points in the suburbs of Munich. In dealing with the future expansion of London, it would be hard to find a more suitable model or one demanding less drastic alterations to existing streets than such a scheme as this. Hyde Park Corner would be much finer if the five broad roads that enter it could be arranged to converge towards a large semicircular architectural place. This sense of enclosure need not necessarily be obtained by means of architecture, and often a fine effect may be made at very small expense by the skilful planting of trees. In Piccadilly and Oxford Circus, the sense of enclosure is entirely lost, first by the streets being taken straight through the place, and secondly by the large proportion of circumferences given up to the street openings.

Although anything like a studied irregularity is hardly likely to be a success, much might be said against the folly of striving after a perfectly regular and symmetrical effect in places, even where they are surrounded by classic buildings.

The public places of a modern city may be considered from three wide aspects, traffic, business and ornament. Business places, include those various types of place whose principal object is to facilitate the transaction of business, such as the market-place and the garage place in front of railway stations

COTTAGES, WALKER GATE, NEWCASTLE-ON-TYNE. EDWARD CRATNEY, ARCHITECT.

---

*Abstract of a paper read before the Royal Institute of British Architects, Monday, 15th November, 1909.

or similar points. Ornamental places include all those laid out solely with the object of adding beauty to the surroundings without any regard to traffic. Architectural places include those which are designed to set off the surrounding architecture to its best advantage. It frequently happens that the fulfilment of two or more different purposes is attained by one public place, as in the Place de la Concorde, Paris, which is both a traffic and an ornamental place, and also in some of the Parisian *ronds-points*, which, besides receiving and distributing the traffic, are adorned with gardens, monuments, and fountains. The Place de l'Etoile is a combination of a traffic and an architectural place.

The ideal form of town plan is the one in which the smallest number of traffic places occur, and it certainly does not add to the ease with which traffic circulates, if it is continually being obstructed by a large number of streams converging to one point. For practical reasons it is desirable that the various lines of traffic should not intersect one another at one point, and where this is likely to be the case this point should be chosen for a pavement or grass plot. High monuments, or any objects likely to impede the drivers' view are to be avoided in such a position.

A very favourite form of traffic place in modern continental cities is the *rond-point* or circus, upon which the thoroughfares converge like the spokes of a wheel. It has been much used where new quarters have to be united to old ones by thoroughfares, and its fullest development has been reached in such examples as the Place de l'Etoile and the Place de la Nation in Paris, planned at the western and eastern extremities of the city. The Place de l'Etoile has a total width of 290 yards between the buildings, the central circular roadway having a width of thirty yards. In the midst of the place rises the magnificent Arc de Triomphe erected by Napoleon in 1806; twelve important thoroughfares, varying in width from the Avenue des Champs Elysées, ninety feet wide, to the Avenue de Jéna, which is only forty feet wide. In addition to the footpath there is a broad gravelled space planted with trees. The surrounding buildings are of one uniform style of architecture, which by a special ordnance of the city can never be changed. An interesting feature of the Place de l'Etoile is the outside ring of side streets, designed to relieve the traffic and to give additional access to the large blocks of buildings surrounding the place. Where the diameter is smaller, and insufficient to allow for the secondary relieving street, the form can hardly be recommended. An ingenious arrangement known as gyratory regulation, first proposed by Mr. Holroyd Smith some few years ago, does not, for reasons which the author is unable to understand, meet with the approval of the powers that be. The author made a suggestion showing the gyratory principle applied to what is one of the most important traffic crossings in London—the junction of the Strand with Wellington Street. He indicated underground passages for pedestrians, but admitted that this system has yet to be proved a success; they do not seem to be much used when provided.

It is often impossible to avoid four or five streets converging. Where this happens, instead of directing them towards a central-point, it is better to form an oblong or an elliptical place, both of which forms are preferable for dividing the circulation of traffic. The Place de la Republique, Paris, is a good example of an oblong traffic place. The half-circle is another suitable form for a traffic place, particularly where traffic coming from one direction has to be spread out, as at the principal entrances to towns, railway stations, bridge approaches, etc. The Piazza del Popolo, Rome, is a good example of this treatment.

It frequently happens that where two important lines of traffic converge to a point, upon what may perhaps have been the boundary of a city, a triangular public place is formed and devoted to the purpose of a village green, as at Shepherd's Bush. Such a position as this would form an ideal situation for a well-planned traffic place. At the present time the stampede that takes place at this point at busy times becomes almost a free fight, and tram after tram has to be laboriously shunted from one line to the other, instead of proceeding in an orderly continuous procession. An improvement might be effected with little difficulty. By a scheme suggested by the author, it would be possible for an ever moving line of trams to circulate easily over the two systems to Ealing and Kew.

The type of business place which on the Continent is known as the garage place, generally planned in front of railway stations, is almost unknown in this country. The railway station is the main entrance to the city, and as such it has taken the place of the old city gates. In America the Railway Corporations are realising that it pays to make station surroundings attractive, and many of the large European cities, like Hanover, Turin, Basle, and Milan, have laid out their garage places in a strikingly beautiful way, in order that the first impression of strangers arriving by rail may be a favourable one. The Bahnhofplatz at Hanover is in many respects a model of its kind; the place is semi-circular in form, and for the better circulation of traffic the central part is laid out as a garden. Three large thoroughfares converge to the outer part of the place and take the traffic to either side of the station, the central roadway being reserved for cab stands and smaller vehicular traffic. As in most cities on the Continent, the railway place is the principal starting place for the entire tramway system of the town.

The author made a suggestion for a terminal place, in front of a station about the size of Victoria. Cab stands are arranged upon either side to take a double row of vehicles easily within hail and at the same time not too much *en évidence*, being partly screened by trees. The tram lines are planned so that this traffic may be kept continually on the move. Those who know the station place at Milan, or the wonderful way in which the trams are planned to circulate in the fine square before the cathedral in the same city, will realise how important this point is. The centre is laid out as an oval garden, with a monumental fountain placed as a termination to the principal vistas. Waiting rooms for trams form part of the design, and a monumental archway gives a sense of enclosure and affords a worthy entrance to a city.

Another form of garage place which is badly required in all our cities is a properly equipped place for the hiring of vehicles. In planning city extensions and improvements all provision for this kind of place is invariably omitted, and for want of better arrangement vehicles for public hire are placed in the centre of roadways or allowed to block up the sides. A good plan is that of the Karlsplatz at Munich, where the cabs are arranged in a kind of recess easily accessible from the footway.

A few of the principal types of architectural place were described, including the Place de la Concorde, Paris. The Place Vendôme; Belgrave Square; the Amalienborg Platz, Copenhagen; the Konigsplatz, Munich; the Lustplatz, Berlin; and the Maria Theresien Platz, Vienna.

The idea of an architectural square of uniform buildings probably originated in Paris, where the Place Royale was laid out by Henri IV. in the early years of the seventeenth century. It is an exact square of 152 yards. From France the idea of the Place Royale was soon imitated in London, where, about 1620, a Commission was appointed by the Crown to "plant and reduce to uniformity Lincoln's Inn Fields as it shall be drawn by way of map or ground plot by Inigo Jones." A few years later the idea was imitated in a grander form in the piazza of Covent Garden. The idea, once started, soon grew into favour, and towards the end of the eighteenth century an increasing demand for dwelling-houses of a more stately character resulted in many large London estates being dealt with as a whole. The usual plan was to form a large open square, to plant trees and shrubs therein, and to design the houses with a view to their architectural symmetry.

To make any attempt at landscape gardening in a town square bounded on all sides by solid blocks of buildings seems hardly like to be a success. The treatment of such a square should be in architectural and formal manner. Any embellishment that it may receive should be monumental in character, such as stone terraces and steps, monuments and statues arranged in harmony with the environing buildings, and disposed in such a way that they will not conflict with the usefulness of the place. If the space permit, a rectangular alignment of shady trees could be introduced, and with just sufficient amount of turf at their base to protect the roots from too hard a surface and also to soften the harshness arising from an expanse of stone or asphalt paving. But the introduction of turf or trees should be completely subordinated to the architectural character of the place, and should be so carefully arranged that the walking space should remain practically undisturbed.

Places Planned as Forecourts to Public Buildings.

Forecourt places are particularly valuable as a means of exhibiting the architecture of an important public building to its best advantage. It is inadvisable that important buildings should be erected in a line with the frontages of the other buildings in the street; and if it is possible to set them back somewhat, an air of greater importance is imparted, and at the same time they gain considerably by being seen in a more favourable perspective. In France the forecourt (*cour d'honneur*) is a very favourite device, and few important public buildings are planned without it. For such buildings as churches, museums, or art galleries a forecourt ensures greater quietude and freedom from dust. Herr Brinckmann has pointed out that classic places differ from mediæval in being almost always treated as forecourts. A fine example of such a place is that planned in front of the Farnese Palace, where several broad streets lead up to a well-proportioned place. The small *piazza* in front of the churches of S. Maria della Pace and S. Ignazio in Rome are both interesting examples of smaller Renaissance forecourts; the former, planned in 1656, is largely occupied by the semi-circular portico of the church. The finest and most monumental place of this kind in the world is that which Bernini planned in front of St. Peter's. The place consists of three parts—the Piazza Rusticucci, surrounded by hotels and shops; the large oval piazza, 370 yards by 260; and beyond that a forecourt with steps leading to the principal entrance. The great piazza is enclosed with an open double colonnade and the forecourt with a closed *logia* of grandiose proportion. The ground level of the oval place falls slightly to the centre; but, beyond, it rises towards the entrance to the cathedral. It was originally the intention of Sir Christopher Wren to surround St. Paul's Cathedral by a colonnade similar to Bernini's treatment of St. Peter's.

The immense courtyards in front of the palaces of Versailles and Caserta are examples of approaches planned upon a vast scale. A very favourite device in eighteenth-century palaces was to spread the approach place out in the form of an immense fan and surround it with dependencies, as at Nymphenburg, near Munich. A far more architectural and dignified form is that of the Schlossplatz at Coblentz, where the palace buildings surround three sides of an inner garden courtyard, the central axial line amounting to over 300 yards. Many of the French eighteenth-century *châteaux* have delightful forecourts that might well be imitated in modern town-planning schemes.

Finally the author dealt with places which are partly built upon. These frequently occur in cities where triangular and irregular sites have been created by intersecting thoroughfares, and are suitable for the erection of such buildings as churches, museums, and picture galleries, whose character demands an important open site on account of their architectural importance and of the necessity of obtaining light on all sides. Extremes of narrowness and width are to be avoided; an exaggerated width leads to a feeling of emptiness which it is not easy to disguise by tree-planting and gardens. This class of place demands skilful treatment where it occurs in a position terminating a vista and forming the meeting-place of several traffic arteries. In this respect most of the best examples are to be found in Paris, where the importance of obtaining a series of imposing street vistas has been better realised than in any other city. In the smaller English towns we often find the market-hall placed in the middle of an open place, as at Abingdon and Peterborough, with a very pleasing effect. In larger examples the traffic requirements demand that the buildings shall be set well back from the traffic currents, and the many instances we find of the violation of this rule result in great disturbance to the traffic. The Place de l'Opéra and Place de la Madeleine, Paris, and the Gensdarmen Market, Berlin, are good examples of ornamental places, though varying considerably in their character. The first is planned upon a lozenge-shaped site overlooking the Place de l'Opéra and terminating a superb vista from the Place du Théâtre Français along the Avenue de l'Opéra, among the finest vistas in Europe. The entire scheme is perhaps the greatest result of Haussmann's remodelling, and architecturally one of the finest examples of town-planning in Europe, though from a traffic point of view it leaves much to be desired.

Fine as Continental cities may be, we Londoners can proudly boast that London stands unrivalled amongst the European cities—I think I might say amongst the cities of the world—in possessing the largest number of public open spaces; both in proportion to her acreage and also to the number of her citizens. It is a curious fact that whereas London has enormously increased her open spaces, Paris during the last century has allowed them to decrease from 960 acres in 1789 to 330 acres in 1900. Having this splendid series of public open spaces, may we not justly reproach ourselves as architects with the poor use that has been made of them? Such a superb site as that offered by Trafalgar Square, with its broad gentle slopes, would have been treated in a far grander way in either Paris, Berlin, or Vienna. How such a site, the centre of the Metropolis, would have appealed to Haussmann! Let us hope that with a better educated public opinion we are on the eve of better times; and it behoves members of this Institute in London to see that when the day comes that the squares of London fall into the hands of the public, the borough councils will realise that it is not sufficient merely to open the gates, or remove the railings, but that whether these squares be replanned as traffic-distributing centres, as forecourts to great public buildings, as gardens, or for purely ornamental purposes, they are the most powerful factors that remain to us for the beautification of our great Metropolis.

Messrs. E. H. Shorland and Brother, of the Manchester Stove Works, Failsworth, Manchester, announce that they have been compelled to remove to much larger works, owing to the increasing demand for their warm-air patent Manchester stoves, grates, and ventilators.

* * *

Hogarth's House at Chiswick has been presented to the public by Col. Shipway, of Grove House, Chiswick. The title deeds have been lodged with the Middlesex County Council. The donor, who is a great admirer of the famous artist's work, has furnished the house with many originals of the great satirist and copies of the original furniture.

This design was the second premium in the recent competition for which 141 competitors submitted designs. The assessor Mr. J. W. Simpson, F.P.R.I.B.A., refers to this design in his report as follows. "The second premium I award to No. 97, whose author submits a thoroughly well-planned design: the various departments are disposed in a way which shows a thorough knowledge of the subject, and the elevations are artistically designed."

THE ARCHITECTURE OF THE INCAS OF PERU.*

A study of the architecture of the Incas of Peru takes us back into the interesting—almost fascinating—past of what we now call the "New" World. Upon the plateaux and slopes of the great snow-crowned Cordillera of the Andes, fronting upon the Pacific Ocean, we encounter a series of ancient buildings and stone structures so remarkable as to compare with those of the Nile; to which, indeed, they have a certain analogy.

The author showed that the climate and topography of Peru bears in an important way upon the architecture of the Incas and pre-Incas who flourished there in past ages. The mural remains of these people, their great monuments in stone and sun-dried brick are found all over the region of the Cordillera, and to a lesser extent upon the coast; and the character of these remains varies much in accordance with their situation and climatic environment. Thus, upon the rainless coast-zone the buildings were largely of adobe, or sun-dried earthen bricks—the material used throughout Spanish-America to-day, whether in Mexico, Peru, or Chile; whilst as we rise to the rainy region of the mountains we observe that they are of stone, shapen or unshapen. The adobe lasts for centuries on the dry coast plains; it would have perished long ago upon the rainy plateaux and become obliterated; and here it is that the beautiful examples of the stone-shaping art of these pre-Hispanic people is found in its perfection. The whole region over which these monuments are found may be taken as more than 1,500 miles long by 300 miles wide, extending throughout what is now Ecuador, Peru, Bolivia, and part of Chile—an enormous range of territory for a semi-civilised people to influence, and greater than that which included the civilisation of the Euphrates and the Nile together.

The Inca Empire, it will be recollected, flourished, as far as can be ascertained, from the time of the first Inca, Manco Capac, who founded the dynasty at the beginning of the XIth century of our era, to the time of the arrival of Pizarro and the overthrow of Atahualpa, in 1532. But the Incas were not the first civilised people of Peru. They were preceded by, and probably inherited their civilisation from, the Aymaras, whom they probably overthrew. The various mural remains throughout the country are, therefore, of different people and periods—some only nine to five hundred years old, others being of much more remote epochs, measured possibly by thousands of years.

The Empire of the Incas, at the time of the conquest of Peru in 1532, had as its main centre Cuzco—the word itself signifies "the navel"—in modern Peru, and Quito, the capital of Ecuador, upon the equator; and these centres were connected by the famous Inca roads, which some historians—generally those who have not seen them—have described as equal to the roads of the Romans, which statement is far from being true. They were, however, means of communication of the utmost value to the Empire, and although they were nothing more than trails for the llamas, those wonderful camels of the Andes which were the only beasts of burden known to the people, who consequently possessed neither horses nor wheeled vehicles, they gave access from place to place, and were traversed by the remarkable system of posts and postmen maintained by the Inca Government. These roads, from Cuzco to Quito, were more than 1,100 miles long—a distance greater than that from the Euphrates to the Nile. Moreover, as engineering structures even, these roads were of considerable merit, crossing by rock-hewn steps the summits of the Andes above the perpetual snow-line, passing swampy lands by stone causeways, and rivers by means of the remarkable suspension bridges made of woven grass or osiers, and by stone structures.

There were two main roads. They both traversed the country longitudinally along the line of least resistance paralleling the ranges of the Andes. One, the most remarkable, ran along the high plateaux and summits of the Andes; the other followed the lowlands of the coast. The groups of buildings are in some cases disposed along the line of these roads, or are adjacent thereto, portions of the roads only remaining here and there. The structures consist mainly of castles and fortresses, temples, palaces, astronomical observatories, tombs, and groups of habitations or towns. All these are now abandoned and in ruins, with the exception of some which form part of recent Spanish-American structures at Cuzco. The Moorish type of building inherited from Spain looks exceedingly incongruous and evanescent in comparison with the solid massive Inca masonry beneath it, in the few instances where the two are encountered together.

The ruins of most notable occurrence are situated in the neighbourhood of Cuzco, and upon the region bordering upon the great Lake Titicaca. This lake, it will be recollected, is of its kind the most remarkable in the world, being 12,350ft. above sea-level, and so large that one may navigate upon it out of sight of land. It is remarkable also in being, in company with some other lakes, a hydrographic entity, which has no outlet or means of exhaustion for its waters, except that of evaporation, as far as is known.

Cuzco is about 200 miles from the lake, and was the great Mecca of the people and the seat of government. Overlooking the city— which to-day is an important, populous place, standing 11,000ft. above sea-level—is what is perhaps the most remarkable pre-historic building in the New World, and indeed in some respects in the whole world. This is the fortress of Sacsaihuaman. It consists of a series of four or more great walls, from 12ft. to 25ft. high, forming terraces up the hillside 1,800ft. long. The walls are built as great revetments, with twenty salients at regular intervals, the masonry being formed of Cyclopean worked stones,

---

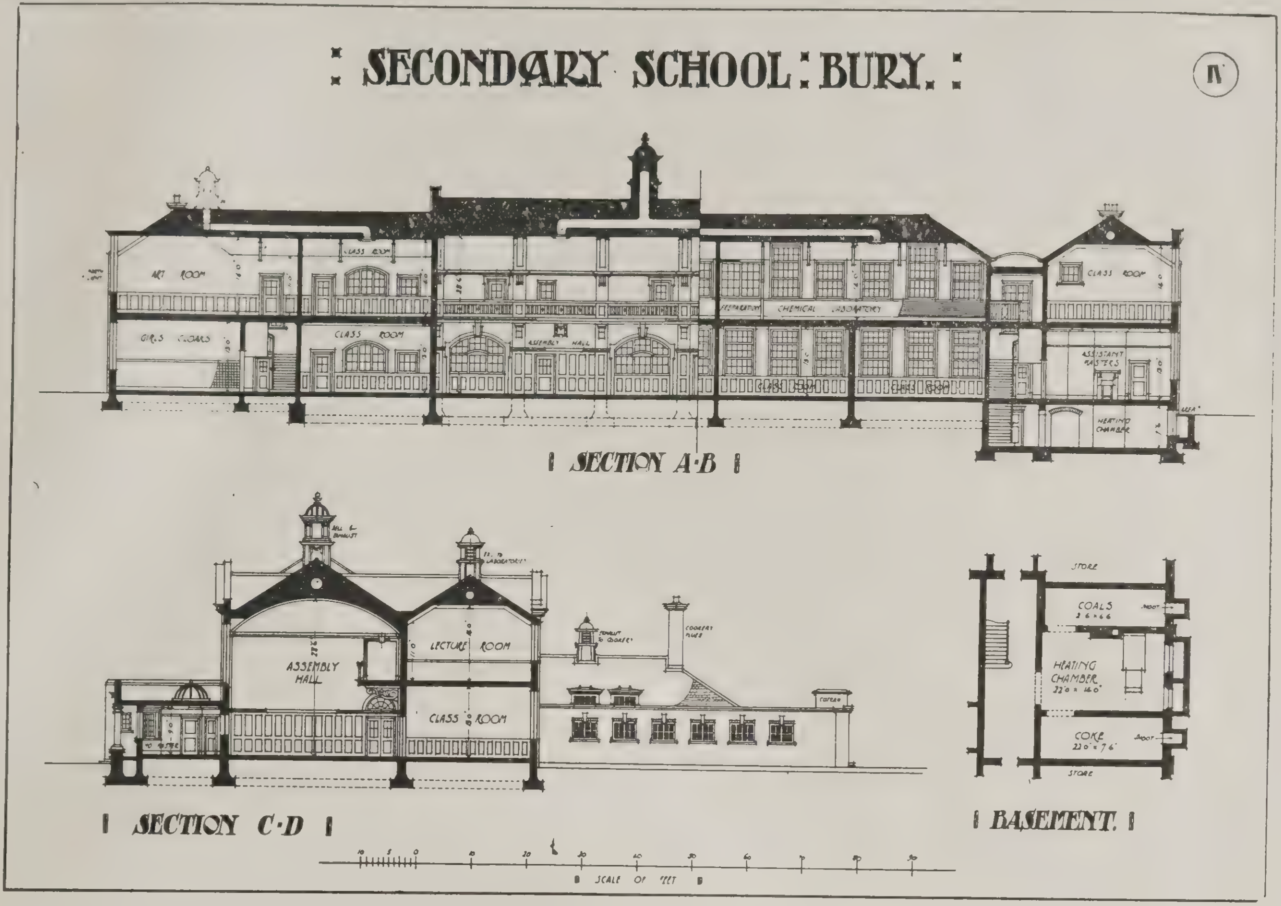
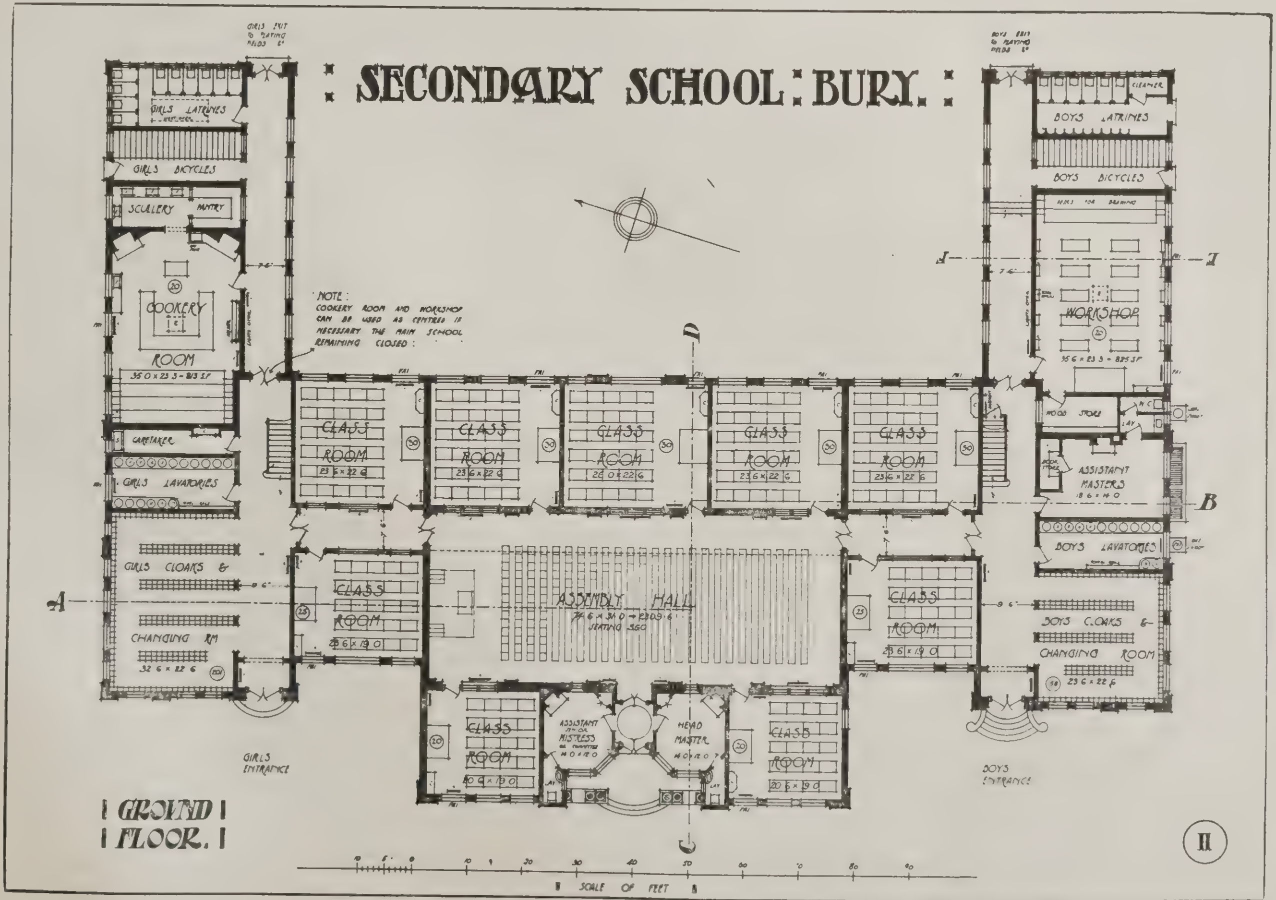
DESIGN BY CASTLE AND WARREN, ARCHITECTS.





DESIGN BY CASTLE AND WARREN, ARCHITECTS.

which in some cases are nearly 20ft. high, weighing many tons. Indeed, we are at once struck on observing the walls of this fortress, as well as those of others of the Inca buildings, with the remarkable character of the masonry, not so much by the size of the monoliths as by what is either a singular disregard of uniformity and alignment in the joints, or is a curious, purposeful variation of these. Thus we see that each stone is an individual, not a counterpart; a polygon, not a cube. In many cases the stones are cut out to fit each other in a way such as must have involved much labour, especially when it recollected that the Inca masons probably had no means of laying out angles; so that presumably the stones were made to fit each other by the laborious method of constantly removing and replacing. It has occurred to me, although I may be wrong, that this giving of an individuality of form to each stone was a nice and purposeful art, or carried out for some now unknown reason. Notwithstanding this diversity of surface, the contact between the stones is generally so perfect that a knife-blade cannot be inserted; and there is no mortar. In some of the temples—it is stated by the Inca historian, Garcilaso—gold and silver was used as a bedding material for the stones. Whatever may have been the reason for this lack of uniformity in the Inca masonry, it is singularly beautiful, and the walls have well resisted the ravages of time and the elements. In the streets of Cuzco some well-preserved examples of Inca walls form part of modern buildings, as before mentioned. A good example is the wall which was the base of the Palace of Huayna Capac, one of the later Inca emperors. Here massive stones are encountered, polygonal in form, fitting perfectly into each other. One of these is a twelve-sided polygon. This wall forms part of an Inca street which is used to-day. In the city of Cuzco there are various other buildings, notably the remains of what was the Temple of the Sun. Overlooking the valley we have also the singular steps or terraces, cut out of the living rock, which is termed "the seat of the Inca," and it is stated that the Inca Emperor took his seat here to watch the construction of the great fortress.

At about a day's ride from Cuzco we reach the head of the Yucay Valley and see its base 4,000ft. below. Upon the slope of this remarkable valley—it is one of those which drain into the affluents of the Amazon—the ruins of another remarkable fortress are encountered—that of Ollantaytambo. This also consists of great terraces of Cyclopean masonry. We also observe in this structure a common feature of Inca architecture—the series of niches in the walls, with their characteristic trapezoidal form, giving a unique and handsome effect. No style of building could accord so well with its environment as these massive structures of the Incas. Possibly the builders were influenced by the mighty mountains which overhang their valleys, and strove to adapt their work to the stupendous Andine architecture on every hand, fashioned by the "Unknown God," to whom their temples were raised.

Another remarkable group of ruins in the same region is that of Intihuatana and Pisac. The latter is another imposing fortress upon the summit of the mountains, a remarkable situation with an extensive view of the surrounding canons. But this fortress of Pisac had its own sacred purpose. It enclosed—and still encloses, the temple wherein stands the famous astronomical stone or pillar of Intihuatana. This word means in the Quechua tongue, "the seat or throne of the sun," or the place "where the sun's rays are collected." The pillar was, in fact, the instrument by which the Inca astronomer-priests determined the solstices. The column, now broken but still existing, is worked out of the solid rock. It is enclosed by a circular tower, and in this the priests observed the shadow of the column upon an east and west line inscribed upon a circle which surrounded it. When the day approached, great feasts were celebrated, and a golden stool was placed upon the shaft so that "Inti," the sun, might "sit down" upon it, for solstice. There were others of these astronomical pillars throughout Peru and Ecuador, but they were generally destroyed by the Spanish priests after the conquest, as "things of the devil"! The fortress and buildings surrounding the column-chamber are beautifully executed—stone-built corridors, halls, and chambers; whilst the whole place, surrounded by beetling precipices and protected by revetments of granite masonry, are impregnable. In the rock walls of the valley are seen ancient tombs in absolutely inaccessible positions to-day. These great fortresses commanded the valleys leading down to the region of the Amazonian forests below, and were to protect the empire from the incursions of the savage tribes dwelling there. Even to-day the forest region beyond the Andes is a savage, unexplored territory in great part, inhabited by bands of Indians, although the business of rubber gathering is opening it up to some extent.

Leaving the regions of Cuzco for that of Tiahuanaco, near the southern end of Lake Titicaca, about 300 miles away on the border of Bolivia, we find ruins which in a sense are more remarkable than those of Cuzco, because far more antique. The temples and fortresses of Cuzco date only from the beginning of the XIth century, as stated, of the Christian era, when the Inca dynasty came to being; those of Tiahuanaco and others are of unknown age, and doubtless were built by the Aymaras at the time of their greatest culture before their overthrow. Some writers, indeed, have maintained that they were contemporaneous with Babylon or Assyria. But be that as it may, they are of a different type from that which the Inca stone-shaping art produced, and they form the ruins of the oldest city in the New World, here upon this high, bleak, sterile plateau of Titicaca, more than two miles vertically above the level of the sea.

The ruins of Tiahuanaco consist mainly of the outline of a great temple, shown by rows of upright monoliths, foundations, parts of stairways, a great stone doorway, and some collossal stone figures. It has been a question how these great monoliths were transported here, but if we take into account the hydrographic conditions of the site, which might have been formerly an island when Lake Titicaca was more extensive than even now, it is conceivable that they were floated to the spot, and possibly their quarries were nearer at hand than has been supposed. Indeed, quarry sites have been established in the neighbouring hills. But, on the other hand, some of these monoliths, both here and at Cuzco, have been transported for great distances over the most broken country imaginable, and their carriage presents the same question as has been aroused concerning the monoliths of Egypt. Near Cuzco is an enormous stone which had been abandoned on the road, and an Indian tradition says that the stone "wept tears of blood" at being left there. These great stones of Tiahuanaco, unlike the Inca walls, are often very richly carved. The most remarkable of them is the monolithic doorway of Akapana, with its carved figures, the central one of which has been taken by Peruvian archæologists to represent the mystic diety Huirakocha. Some of the lesser figures have human bodies, hands and feet; some human heads, others heads of condors; some wear crowns and carry sceptres, and they appear to be in an attitude of adoration of the central figure, which itself holds sceptres, carved with the heads of tigers and condors, which were probably symbolical of strength and power. This central figure of Huirakocha (or Viracocha) was the supreme god of the Andine people, typical of the "Abyss of the Waters," as was "Ea" among the Chaldeans. Among other notable monoliths of this group of pre-Inca ruins is a great stone image, about twice the height of a man, which stands upon the plain.

Upon the islands of Lake Titicaca there are other remarkable ruins, both Inca and pre-Inca. From this island it was that Manco Capac, the first Inca, whose virgin birth as a redeemer of man is part of the Inca mythology, set out to civilise the savage tribes of the Andes. There are many ruins on this island, as also upon that of Coati; ruined temples to the sun and the moon, the former of which the Inca worshipped as symbolical of a greater Deity. There was, indeed, much that was chaste and ethereal in the Inca religion. They imagined a Supreme Being, an "Unknown God," who pervaded everything but who could have no visible or tangible form or likeness; and they did not set up idols, nor were human sacrifices performed. The image of the Creator was represented at Cuzco by an elliptical plate of gold set on the wall of the temple. In the Titicaca region there is also a remarkable ruin, known as the "Temple of Huirakocha"—huge walls which probably were never completed; work of the Aymaras.

If now we leave this part of Peru and Bolivia and journey to the north some 700 miles—or about 400 from Cuzco—we reach the region of the Upper Maranon River, where we encounter several other beautiful examples of the Inca and pre-Inca stone-shaping art. Indeed, we shall have passed other vestiges of their time upon the way, such as the monoliths of Huaitara, and ruins of prehistoric villages in many places. The modern capital of this region is the town of Huaraz, a typical Andine city, 10,000ft. above sea level, and overhung by the snowy Cordillera to the east. There are many vestiges of the Inca period here, but we shall cross the main range of the Cordillera; and one of the passes which I have traversed on various occasions is an old Inca pass of rock-hewn steps at an elevation of nearly 15,000ft. We then descend to an affluent of the Maranon, upon which is situated the remarkable Castle of Chavin. This castle, which the author explored, is largely in ruins, but there are numerous singular underground chambers and passages, the purpose of whose construction it is difficult to understand. The walls are of blocks of hewn stone. But the main point of interest here is the singular carved monoliths, doubtless of pre-Inca origin, which exist or existed here. One of these, a beautifully carved stone about twice the height of a man, was transported over the Andes and down to Lima, on the coast, where it stands in the Exhibition Park. Another in the form of a column yet remains in place.

The whole of this remote region of the Upper Maranon is dotted with the ruined dwellings of the former occupiers of the land. Houses, streets, fortresses, sometimes in the most inaccessible positions, upon appalling crags, towards which the night-mists from the Maranon roll up in fleecy folds like a mysterious pall, and from them these ruined castles and wall start suddenly as we behold them, like the ghosts of the dwellings of a vanished race—which, indeed, they are—weird and unique. The disposal of these numerous ruins, often about a central fortress commanding the heads of valleys, and surrounded by the abandoned "andenes" or terraced fields of these people, goes to show that the inhabitants lived as clans, or "Gentiles," and their ruined dwellings are termed by the Indians of the Andes to-day "casas de los Gentiles," or "houses of the Gentiles." These "andenes," or cultivated terraces, are a most striking feature of the Andes. It has been calculated that the population of the Inca Empire might have reached 90,000,000 souls, but the author considers this greatly over-estimated. It is not difficult, however, to conceive a people as numerous as that of Great Britain to-day.

The most remarkable group of ruins in this region is that of Huanuco Viejo. It stands upon a broad, flat plain upon an arm of the Maranon, at an elevation of about 12,000ft. above sea level, and consists of an extensive palace, a fortress or temple of the sun, baths, and an extensive village of streets, with a singular series of round and square dwellings, alternating, in long rows. The chief architectural feature of the buildings is a series of stone doorways, really beautiful examples of Inca masonry, and the castle or temple. In the palace there are six of these doorways, all standing in a line at considerable distances apart, so that the observer who takes his stand in front of one of them is enabled to see through the whole series. The line so taken through them is about east and west. The total length across the courtyards or halls to which these doorways give access is about 400ft. The doorways are of typical Inca tapering or trapezoidal form, with quoins and lintels of beautifully fitted stones of the more or less polygonal form previously described, and so closely fitted that a knife-blade cannot be inserted in the joints. No mortar has been used. The lintels are monoliths of nearly 7ft. in length in some cases, and the thickness is about 3ft., which is that of the walls of which they form part. The characteristic niches, also of trapezoidal form, are a marked feature of the walls of these ruins.

The castle, which stands in the centre of what was a huge square, around which the palace or palaces are disposed, is a building of different character. It is rectangular in form, about 100ft. wide and 170ft. long, very solidly constructed of cut stone blocks surmounted by a cornice, whose moulding is composed of a fillet and cavetto, as in the Doric order. The whole plain in the vicinity is covered with the ruins of small habitations, generally of unhewn stone. All the masonry of these ruins is composed of blocks of silicious limestone, which have been extracted from a stratified hill at edge of the plain.

The ruins of Huanuco Viejo are of much interest, and, as far as the author is aware, they had never been previously examined and depicted. These great stone structures of the high plateaux are in a region at a vast elevation above sea-level, where there is little vegetation, absolutely no timber, and where corn or other cereals will not grow.

Leaving the high region of the Sierra and descend to the coast, the principal ruins of the Incas, pre-Incas, and other semi-civilised former occupants of the land, such as the Chimus, are found to be mainly of buildings constructed of adobe.

The most famous of these ruins formerly was that of Pachacamac, which at the time of the Conquest was a splendid temple raised to the "Unknown God." To-day, nothing remains of this great temple but a mound of rubbish, a day's ride from Lima. Proceeding along the coast-zone to the south we shall reach a group of ruins known as "Incahuasi," or "the house of the Inca." These, unlike the coast ruins generally, are of stone, although they lack the beautiful workmanship of the mural remains we have visited in the Andes. But they are unique in one respect—they contain a row of columns. This is an architectural feature absolutely unknown in the Inca and pre-Inca ruins elsewhere, for, except in this case, the column was unknown to the Andine people, as was the arch. The columns of Incahuasi are not monoliths, however. The building probably dates from the XVth century. Still further to the south, slightly inland from the port of Pisco, we encounter an extensive group of adobe ruins in a good state of preservation, consistng of long walls with characteristic trapezoidal-formed doors and niches, and corridors, halls, and rough stone foundations. The niches are still coloured with some red pigment, possibly vermilion from the great quicksilver mines in the Andes to the east, for vermilion was obtained from the cinnabar to paint the faces of Inca beauties.

Still further south in this coast-zone of Peru were encountered remains of long aqueducts, a line traceable for 80 miles along the hill-slopes, for the Incas were expert in hydraulics and irrigation works. There are other long ruined aqueducts in other parts of the country also.

Far to the north, we come to the region where the Chimu people flourished, who were overthrown by the Incas. They were a powerful semi-civilised coast people, and numerous ruins attest their skill in mural construction. Among these the most notable are the ruins of Chan-Chan, whose walls show florid decorations, elaborated in cement. These ruins are not far from the modern city of Trujillo, and would repay careful study.

The Inca and pre-Inca architecture differ much. They first lack any iconographic carvings, such as we have seen at Tiahuanaco and Chavin. Monoliths of considerable size were common to both; one of those at Cuzco is 27ft. long, 15ft. wide, and 12ft. long, and there are others of almost equal size. The stones vary as to their geological composition according to the region; some are of granite, as at Cuzco, some of trachyte, sandstone, or basalt, whilst others are of a hard, silicious limestone. It is to be recollected that this remarkable stone-shaping art was performed without the use of iron; but the Incas possessed bronze, termed *chumpe*, and copper tools. Indeed, they were skilled metallurgists in copper, gold, and silver. As previously stated, the Incas were unacquainted with the arch, but nevertheless they constructed dome or "beehive" roofs, both to their tombs, at times, and to their conical houses, whether of stone or adobe. They also employed the principle of corbelling-out over openings, and to form the abutment of small bridges. In general terms the principal characteristic of the Inca architecture is its great solidity. It would seem that the builders had desired to bequeath to posterity these chapters in stone of their history; and, indeed, it is safe to say that these may be expected to outlast any of the modern structures of America, whether the architectural work of Colonial Spain—good and solid as this is generally—or whether the evanescent skyscrapers of the Anglo-Saxon on the Northern Continent. Solid as these walls are, however, the roofs of the large buildings have perished long ago; as their builders do not appear to have been able to advance beyond sloping roofs of poles covered with grass thatch; or, at any rate, in the absence of anything else we can only assume this to have have been the case. Their buildings, with small exception, are never of more than one story. Nor were they acquainted with the use of burnt brick, although their ceramic art was an advanced one, as we know from the beautiful and abundant Inca pottery. In the shape of their vases (as well as in the form of some of their buildings) they showed a curious knowledge of acoustics. There were no doors to the houses, the openings being covered with a mat. The interiors of the temples were covered with plates of gold, of which the Spaniards secured great booty.

A few words as to the origin of the Incas and pre-Incas. Their generally assigned origin is from Asia, and the Mongol cast of face is very noticeable among the pure indigenes, both of Peru and Mexico. As to their arts, an origin has been assigned in Egypt and in Mesopotamia We have seen the tendency to the pyramidal in the Inca structures, giving some atmosphere of the buildings of the Nile. A host of other analogies have been adduced. The use of copper tools, the custom of embalming the dead, for mummies are common objects in the Inca tombs; the Indian canoes of Lake Titicaca, with their turned-up prows and mat sails, which are the counterpart of such a craft figured on the tomb of Rameses II.; religious customs, including sun-worship and moon-worship; matters of design upon pottery and woven textures; the wearing of sandals; and, above all, their stone-shaping art and their transport of monoliths. The theory of Asiatic or Egyptian origin has been strenuously denied and strenuously supported, and the approaching shores of Behring Straits, where America touches the fringe of Asia, have been pointed to as the probable path which these prehistoric immigrants followed, when, bearing in their bosom the germs of a civilisation and a religion from the ancient world, they passed down these 10,000 miles of Pacific littoral and inclement Cordillera of America.

Discussion.

Mr. R. Phené Spiers proposed a vote of thanks, and remarked upon the excellent drawings that Mr. Enock had prepared. It seemed that there had been two races in Peru before the advent of the Spaniards—the Incas and another race, of which no definite evidence of habitation remained. It had been conjectured that this race had had some relation with the Babylonians or the Egyptians, but he, personally, put no faith in the theory. Referring to the peculiar trapezoidal form of some of the doorways and arches, Mr. Spiers advanced the view that the latter work of this kind, in stone, was copied and made a purely decorative feature from the old sun-dried brick constructions. The raking sides, he believed, were not of Egyptian origin. He would like to know how the Incas covered in their buildings. It was true that the modern roofs were formed of poles covered with thatch, but he believed a race that could erect such massive walls would require, and would certainly evolve, a far more durable covering than that. The roofs must have been either flat or doomed. The reason of the complex irregularity of the huge stones which formed the walls was to be found in the obvious fact that the builders of that time chose the materials immediately to hand. They built in horizontal form later, because they had found a suitable stratified stone. Mr. Spiers then made reference to a colossal wall that Mr. Enock had stated to be the remains of a temple. He (Mr. Spiers) was, judging from its appearance, more inclined to think it originally filled that office of an aqueduct. The openings of peculiar formation were extremely interesting; and he thought that they must have had the arched form. The wall was perfectly magnificent, and must have involved an immense amount of labour in its erection. M. Choisy had shown in his book how the ponderous materials were transported. He had great pleasure in proposing the vote of thanks.

Mr. F. Dare Clapham seconded the vote of thanks, and observed that as Mr. Spiers had dealt so ably with the architectural aspect of the paper, there was little left for him to say. Judging from Mr. Enock's description of the climate, it was small wonder that a sun-worshipping people went to a land like Peru. The Incas were not the first inhabitants; but was it not curious that the indigenes should bear a distinct resemblance to Asiatic types? He wondered whether there were any mummified remains to give evidence of the early inhabitants. The rugged architecture seemed quite in accordance with the tremendous mountains surrounding it. The ancient roads and bridges must have been wonderful engineering works. From what he had heard, it would appear that that early civilisation was one of little freedom, but of much order and well-being. Everything was done under strict supervision; quantities of water were dealt out for agricultural and other purposes, and he understood that doors had always to be kept open in order to ensure the absence of too much luxury. He heartily seconded the vote of thanks.

Mr. Leonard Elkington and Mr. H. W. Brittan having supported the vote of thanks, Mr. Tanner commented upon the interesting discussion that they had had, and remarked that the Incas, in their selection of territory, had chosen a singularly inhospitable position. There could not have been enough to sustain life. The architecture was purely rudimentary; and, referring to the point that Mr. Spiers had raised, he thought some kind of centering must have been employed in the construction of the openings in that huge wall.

Mr. Enock, in reply, observed that it was impossible to go into the subject of the origin of the Incas. No solution of the mystery had been found, although there were indications of Asiatic origin. With respect to the roofs, it should be borne in mind that the coast zone was a rainless region. On the plateaux of the Andes, however, there was an excessively heavy rainfall, and snow. He believed that some of the roofs in this latter region were flat, with earth to keep the water out. In one of the buildings he had observed the appearance of a double gable end. Mr. Spiers said that the trapezoidal form was evolved from the sun-dried brick. This could not have been, because that particular form was found only in cut stone. There were plenty of mummies, but they were all of comparatively recent date. They were buried in rough stone cells, and could be found in all parts of Peru. Some of the woven bridges still exist, some of which were 200ft. long, which was a great length for a primitive suspension bridge. It was certainly remarkable that such a well-ordered civilisation of undoubted socialistic character should collapse before a mere handful of marauding Spaniards. The social system gave no rise to initiative or progress; and when an attack was made they could not stand against it. He thanked them heartily for their very kind reception.

The following gentlemen were elected members.—Mr. W. B. Steadman, Mr. R. G. Hopcraft, and Mr. W. Paramor.

The Marylebone Borough Council has decided to pave Cavendish Square with wood at a cost of £4,865. It was decided to apply to the London County Council for a loan of £24,000 to extend the electric light along 21 streets of the borough. Mr. Debenham, chairman of the Electric Supply Committee, said that this would provide work for no fewer than 400 unemployed men in Marylebone for a period of 16 weeks at a wage of 25s. a week.

* * *

Sir William Richmond, R.A., presiding over the annual meeting of subscribers to the British School of Rome, on the 16th inst., said that archæology had caused Egypt to live again in the 20th century. Layard, Wilkinson, and Newton and others had, in a sense, remodelled history, and, with often too little help from the Government, had enabled the world to understand the building up of ancient civilisation. Archæology had been very serviceable to artistes, whose spontaneity and technical artifices need not be hampered by being truthful; they should rather be assisted than otherwise by modern research. Italy was so full of variety that the whole ground had not been uncovered yet, either by the spade or by the scholar. It was a mine of treasures as yet unworked, and wherever he had gone he had found a local archæologist, struggling sometimes to bring out a book, learned in his way, and ready to give up his time to an eager stranger. Scattered about in various churches there were very fine pictures and frescoes, while in the Museo Nationale at Rome there were fragments of wall paintings of great beauty of design, as well as of execution and colour, inscribed with Greek names. They seemed to him to possess qualities of colour in advance of any wall paintings as yet discovered, except perhaps the latest found wall paintings at Pompeii. Much of this beauty, its transparency, quality and beauty of colour, especially on walls where large areas of pigment were necessary, being the result of a perfect technique, caused one to long to know what were the methods of those ancient Masters, who in so simple a matter, as it would seem, as making a big space of one tone of colour vital, interesting, and precious, beat the moderns out of the field. What were their pigments? He suspected that they were only the common earths found near Rome. But what technique was employed? A chemical analysis would indeed be interesting and instructive. If some student of the School at Rome could solve the questions relating to colours and their uses in Rome how grateful artists would be. The ninth report of the committee refers to the excavations, carried out by the Government, in Malta; and the completion of the catalogue of the Capitoline Museum.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Nov. 30.	HERNE BAY PAVILION ON PIER Herne Bay Urban District Council invite competitive drawings for a pavilion to be erected on the proposed extension of the pier at a total cost not exceeding £4,000, exclusive of architect's commission. Premiums of twenty-five guineas and ten guineas. Plan of the site and copy of the conditions may be obtained from J. Jubb, Clerk to the Council, Town Hall, Herne Bay. Deposit: on. guinea.
Nov. 30.	TECHNICAL AND SECONDARY SCHOOL, WORKINGTON. The Cumberland Education Committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the Borough of Workington, Cumberland, for about 300 pupils of both sexes. Further particulars and conditions upon which plans will be received may be obtained from the undersigned on receipt of a stamped and addresse foolscap envelope and the payment of a deposit of one guinea. Deposi returned if all papers sent are returned within seven days. C. Courtenay Hodgson, Secretary, The Courts, Carlisle.
Dec. 1.	TRALEE. CARNEGIE LIBRARY AND TECHNICAL SCHOOL. Cost not to exceed £4,500. Premiums of £20 and £10 for design placed first and second by the assessor. Copies of instructions and conditions from the Town Clerk, Tralee.
Dec. 1.	PUBLIC PARK PLAN, BANGOR (COUNTY DOWN). The U.D. Council offer a premium of £30 for the best scheme for laying out a public park, twenty acres in extent. Premium to include all expenses of successful competitor, whose designs become the property of the Council. Schemes to J. Middleton, Town Clerk, Town Hall, Bangor, County Down.
Dec. 8.	PRINCE HENRY'S GRAMMAR SCHOOL, OTLEY. New buildings in Farnley Lane, Otley. If the number of applications to compete is excessive it is intended by selection to invite 20 or 25 architects only to compete. A fully-qualified non-competing architect, in conjunction with the West Riding Education Committee's Inspector of Secondary Schools, will assist the Governors in adjudicating upon the plans. Applications, stating qualifications and experience, must be received by Ernest S. Mead, Clerk to the Governors, East View, Otley, before the date named.
Dec. 11.	MINEHEAD. SHELTER, with cloakroom and lavatories, on the Beach, the whole expense of which is not to exceed £3.000. Premium of £20. Plan of site and conditions from L. C. Webber-Incledon Clerk to U.D. Council, 16, Park Street, Minehead, Somerset.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan. 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3,600, Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Cleqrkkin, Secretary, Technical In-Instruction Committee, Larne.
1910. Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.

Workington Technical School Competition

A notice has been circulated by the Council of the R.I.B.A. requesting members not take part in the above competition.

Preston Grammar School.

Mr. F. W. Catterall, the assessor, selected six designs out of the 179 sets submitted, and the final choice was made as follows:—First premium, Messrs. Woolfall and Eccles, Liverpool; 2nd premium, Mr. Arthur Greenwood, Manchester; 3rd premium, Messrs. Packer, Drewitt and Drewitt, Southport. The building is estimated to cost about £12,000.

At King's College, London, on November 6th, master and operative plumbers attended for practical and theoretical examination for the purpose of registration under the National Registration of Plumbers. The practical examination consisted of tests in lead bossing, also bending and wiping large and small joints as required for good class domestic sanitary plumbing. In the theoretical examination questions were put to the candidates dealing with subjects of domestic sanitation generally, ventilation and the connection of water services to domestic dwellings and public institutions. Nine candidates succeeding in passing the examinations and were nominated to the General Council for registration under the National Registration of Plumbers, and admission to the register.

* * *

The following method of painting a cement wall was described at a recent convention of Canadian master painters. The building had become discoloured in places, and the joints were of a different colour from the surface of the blocks. Two parts of Portland cement, together with one part of marble dust, were mixed with water to the consistency of thin paint or a thick whitewash. The wall was well wetted before the application of this paint, and kept constantly wet while the material was applied, and then kept dry for a day in order to make the cement wash adhere to the cement surface. The wash was applied with ordinary whitewash or calcimine brushes, and a man was kept busy playing a spray on it while the work was being done. The whole secret of success lay in keeping the wall constantly wet.

Works in Progress and Completed.

ABERBEEG.—The Llanhilleth new Parish Church, which stands on an elevated site near the Rectory, was recently dedicated. It is designed in fifteenth century Gothic style of architecture, and is built of local stone, with Doulting stone dressings. The roofs are all of open timbered construction, and the seating and choir stalls of Austrian oak. The chancel, transepts, and towers are completed, but at present only about one-third of the nave and side aisles is finished. The church will accommodate about 300 worshippers at present, and 500 when completed, the cost being over £4,500. Mr. E. T. Bevan, of Penarth, is the builder, and Mr. E. A. Johnson, F.R.I.B.A., of Abergavenny and Merthyr, the architect.

BERWICK.—The new parochial buildings which it is proposed to erect in connection with the Berwick Parish Church, are to be built externally with local stone. The architects are Messrs. Harrison and Ash, who were placed first by the assessor, Mr. H. Beck, Doncaster, in the recent open competition. The buildings are estimated to cost about £2,000.

BRADFORD.—The foundation stone of a fine addition to the textile and engineering departments of the Bradford Technical College, which is to be erected in the Renaissance style, has been laid. The addition is estimated to cost about £18,000, while a further £14,000 will be involved in the provision of machinery and fittings. The design has been prepared by Mr. R. G. Kirkby, A.R.I.B.A., the City Architect.

BUDE, CORNWALL.—The foundation stone of the new Granville Hotel has just been laid. The site on which the hotel is to be built is a fine one, being situated on high ground, sheltered from all cold winds, and commanding an uninterrupted view of the St. George's Channel and the Cornish hills. The building has been designed by Messrs. Hatchard Smith and Son, F.R.I.B.A. of London, and is being erected by Messrs. Pethick Bros., under the superintendence of Mr. W. Hatchard Smith.

DUNNING.—The new reading room, which has just been opened, is the gift of Sir John Wilson, Bart. It is built of local stone in Gothic style, and forms an addition to the Town Hall. Mr. W. C. Laidlaw, of Edinburgh, is the architect.

EAST HAM.—The extension of the isolation hospital, which was opened recently, and which has cost £8,000, consists of two wards, each containing ten beds with the usual offices and nurses' quarters, etc., on the first floor. Large plate-glass windows divide each cubicle, so that the sister in charge can have a complete view of the patients throughout the whole ward. A doctor's residence, which has also been erected, is on the bungalow principle.

EDGWORTH.—The Edgworth Village Institute, which has just been opened, completes the memorial to the late Mr. and Mrs. Barlow, of Greenthorne. The building, which is in the Tudor style, is built of Accrington pressed bricks, with stone facings, and roofed with Staffordshire tiles. The main entrance is in the centre, and forms the lower storey of a clock tower. Mr. G. Faulkner Armitage, of Altrincham, is the architect, and the main building contract was carried out by Messrs. J. Hatch and Sons, of Lancaster.

EXETER.—The monument which has been erected in the Barnfield to commemorate the martyrdom of Thomas Benet, M.A., who was burnt at the stake at Liverydole in 1531, and of Agnes Prest, who suffered a similar fate on Southernhay in 1557, was recently unveiled. The work has been carried out in its entirety (under the professional direction of Mr. J. Archibald Lucas, F.S.I., A.R.I.B.A.) by Messrs. Harry Hems and Sons.

FORFAR.—The extension of Forfar Academy, which is now proceeding, will provide on the basement accommodation for the heating apparatus, etc. There will be a cookery and laundry classroom on the first floor. There will also be provided a gymnasium 52ft. by 30ft., with a lady instructress' room, boys' and girls' dressing-rooms, and music room. At the rear of the first floor will be situated a large workshop, with engine-room, a teachers' room, and a wood store. On the second floor there will be three large art classrooms, with a teachers' room, and also a capacious music room and dining hall. Messrs. Gavin and Soutar, Forfar, are the architects.

HARLINGTON.—The Baptist church has recently been remodelled, renovated and decorated, under the superintendence of Messrs. George Baines and Sons, 5, Clements Inn, Strand, London. The contract has been carried out by Mr. T. W. Crutchfield, of Harlington.

HEXHAM.—The new Queen Elizabeth Grammar School, which is now in course of erection, is a single-storey building enclosing a quadrangle. The assembly hall on the north side is 74ft. long by 29ft. broad, and has an open hammer-beam roof and oak panelled dado. Along the east and west sides of the quad. a wide corridor gives access to the classrooms, which accommodate 240 scholars. On the south side are the chemical and physical laboratories. The quadrangle itself will be laid out as a herb garden for the instruction of the students, and the architects suggest that a statue of Queen Elizabeth (the foundress) should be placed in the centre. The buildings are of stone, with red tile roofs. The school is being erected by Messrs. R. Blackett and Son, contractors, Darlington, from the designs and under the superintendence of Messrs. Oliver, Leeson and Wood, architects, Newcastle.

HUNSLET.—The new Council offices, which have just been opened, have been erected from the design of Mr. B. W. Higgins, of Oulton. The building is plainly but substantially built of stone and brick, and contains ample accommodation for the Council. The total cost, inclusive of site, is about £2,000.

ILFORD.—The new Hippodrome, which has been erected here, is a good example of modern theatre design. The elevation, which is treated plainly but tastefully in the Early English Renaissance style, is faced with red brick and white cement dressing and roughcast filling, flanked by two facades with gables with projecting cornices, and between these, over the entrance portion, which has a handsome verandah, an open loggia with columns supporting a tall roof covered with rich brown tiles. The fourteen exits from all parts of the house lead to Ilford Lane and the private road at the side. The auditorium, 74ft. by 74ft., is capable of accommodating an audience of 3,000. The stage, 60ft. wide by 33ft., is provided with up-to-date machinery, and has the usual flies and grid; the proscenium opening being 33ft. The entrance staircases and waiting-rooms are so designed that they will contain the entire audience, who may thus be under cover while waiting. The ground area on which the building stands covers 10,500 sq. ft. The circles, being supported on the cantilever principle, afford a clear uninterrupted

ENTRANCE ANNFIELD PLAIN PUBLIC LIBRARY. EDWARD CRATNEY, ARCHITECT.

view of the stage from all parts of the house. The whole of the building is lit by electricity by Messrs. Strode and Co. The decorations in white and gold, the draperies, carpets, and seating, are by Messrs. Dean, of Birmingham. The main building has been erected by Messrs. Coles, under the supervision of the Clerk of the Works, Mr. John F. Revill.

LIVERPOOL.—The construction of the Liverpool Cathedral is making but slow progress, the Lady Chapel being the more advanced section of the work. The whole of this structure has been covered in, and at present a staff of experts are busily engaged in putting the finishing touches on the carving work on either side of the chapel. As showing the stage at which the building of the Lady Chapel has arrived, it is interesting to note that the stained-glass windows are about to be inserted. In order that this may be accomplished safely and without undue delay, the chapel is to be closed to the public until the work is completed, four or five months hence. This step was decided upon at a meeting of the Cathedral Committee, when it was reported that further funds would be necessary in order to complete that portion of the work at present in hand, comprising the Lady Chapel, the ambulatory, the chapter house, the vestries and choir, and a portion of the great transept. Between £60,000 and £70,000 will have to be raised before these various sections can be prepared for purposes of Divine service. They will then give accommodation for about 2,000 worshippers.

LONDON, S.W.—The large building known as "Wellington House" Residential Hotel, which has just been opened at Buckingham Gate, S.W., occupies a superficial area of 12,272ft., having a frontage to Buckingham Gate of 174ft., and 143ft. to York Street. The building occupies an island site and is, therefore, unusually free from fire risks and noise from adjoining buildings. The accommodation consists of self-contained flats and single rooms, with public rooms for use of tenants, consisting of billiard-room, smoking-room and lounge, restaurant, dining, drawing and writing rooms, with banqueting and reception rooms ensuite; the scheme being to produce something between a high-class hotel and self-contained flats de luxe at one inclusive charge. The elevations are carried out in red bricks and gauged work in a style of free Renaissance, with rich modelling and decorations in Dennis terra cotta with dragged surface. The general contractor was Mr. C. Gray, of Kensington. The kitchen equipment was supplied and fixed by the Falkirk Iron Company, and passenger and service lifts by Messrs. Waygood and Co. The decorations, furniture and appointments were carried out by Messrs. Maple and Co., Ltd., from designs and under the immediate supervision of the architects, Messrs. Palgrave and Co., with Mr. Percival Hawkins, A.R.I.B.A., as chief-of-staff.

LONDON, W.—The Bishop of London recently dedicated the new chapel of All Souls, which has been erected on the south side of the church of St. Michael and All Angels, Bedford Park, W. Lord Halifax, who laid the foundation-stone in June last, has now given the silvered altar candlesticks, which are of Renaissance date. The architect of the chapel is Mr. Maurice B. Adams, who was churchwarden when Dr. Jackson, Bishop of London, consecrated the church in 1878, and still holds the same office.

LONDON, W.—The contract for the alterations to, and reconstruction of, No. 2, Seamore Place, Park Lane, W., under Mr. W. H. Romaine-Walker, architect, has been obtained by Messrs. Patman and Fotheringham, Ltd., 100 and 102, Theobald's Road, London, W.C.

MANCHESTER. — A new Wesleyan Church, which has been erected at a cost of £3,000, and which provides accommodation for 500 worshippers, has just been opened.

NEWCASTLE.—The new public hall has been erected in Northumberland Road, Newcastle, on the site of the old Yeomanry parade ground. The building is surmounted by a fibrous plaster dome tower, which is 80ft. in circumference. The building is of brick, and the principle hall, which will be used as a skating rink, about 250ft. in length, by 120ft. in breadth, and can easily be converted into a meeting place for concerts, political meetings, and other large gatherings. Seating accommodation for 6,000 people is provided, and a balcony will seat another 1,000. Messrs. J. Parkinson and Sons, of London, Blackpool, and Newcastle, are the builders, and Mr. J. H. Morton, F.R.I.B.A., of Newcastle and South Shields, is the architect. The front is by Messrs. S. De Jong and Co., London.

PETERBOROUGH. — The restoration scheme at St. John the Baptist's Parish Church, Peterborough, has involved a sum of more than £4,000. The chief work has been on the tower, which was in an extremely dangerous state, and the west end of the building, formerly obscured by unsightly brickwork, has been thrown open to the rest of the church. Some fine oak screens have been presented, to separate the vestry and baptistery from the main building. The church bells are being rehung, while several large windows, formerly bricked up, have been opened out, and filled with new tracery.

SOUTHAMPTON.—The East Street Baptist Church and Schools, which are shortly to be erected, have been designed in late Gothic style freely treated. Externally the facings are of red bricks with Bath stone dressings. The complete scheme embraces a church with a lofty tower, seniors' school, intermediates' school, and juniors' school. The last section is to be omitted for the present.. The cost of the portion to be executed is about £6,000. The architects whose designs were selected in a recent competition are Messrs. George Baines and Sons, 5, Clements Inn, Strand, London.

WATFORD.—The Leavesden Road Baptist Church and Institute, which were opened recently, are designed in a late period of Gothic, freely treated. Accommodation for 700 persons has been provided. Externally the building is faced with dressed red bricks with bath stone dressings, the internal joinery being of pitch-pine. The contract, which amounts to £4,150, has been carried out by Messrs. Chas. Brightman and Son, Watford. The architects whose designs were selected in a recent competition, are Messrs. Geo. Baines and Son, of 5, Clements Inn, Strand, W.C.

WORCESTER.—The new secondary school for girls, the foundation stone of which was recently laid, will, structurally, be a connecting link between the educational institutions which have their homes in the existing Institute buildings. It will occupy the space between the art and technical schools block in Sansome Walk and the library, museum, and art gallery block in Foregate Street, having its main entrance in Taylor's Lane. The school has been planned to harmonise with the existing buildings in material and design, the detail being carefully repeated, and will make the Institute a complete suite of buildings. The building, which provides accommodation for 200 girls, is being erected by Messrs. J. Wood and Sons, Ltd., from the designs of Mr. Alfred G. Parker, the city architect.

Invitations have been issued by Mr. Henry R. Aldridge on behalf of the National Housing and Town Planning Council, to a conference, to be held at Westminster Palace Hotel, on December 14 and 15, to consider suggestions as to the most practical lines of town-planning procedure adapted to urban districts, and to great centres of population. Papers are to be read by a number of well-known housing reformers, including Professor Adshead, of Liverpool University, Mr. B. Sebohm Rowntree, and Mr. Raymond Unwin.

Our Plate.

Annfield Plain Public Library.

This building, towards the erection of which Mr. Carnegie gave £3,000, was completed at the beginning of the year. It is built of local stone and roofed with Welsh slates, the floors of all main rooms are laid with wood blocks, and the interior fittings were executed in oak, from designs by the architect. There are spacious bookstores and workroom, heating chamber, etc., in the basement, connected to the ground floor by lift. The architect for the building was Mr. Edward Cratney, of Wallsend and Sunderland, whose design was selected in competition. The general contractors were Messrs. Southren and Johnson, of Dipton, Durham, the sub-contractors being as follows:—Heating, by Messrs. Emley and Sons, Newcastle; interior fittings, by Messrs. Robson and Sons, Newcastle; wrought-iron gates, by Messrs. Spittal and Clarke, Birmingham; lead rain-water heads and pipes, by Messrs. Henry Hope and Sons; and the lead lights by the Gateshead Stained Glass Company. The furnishings were not to the architect's selection.

Cottages, Walker Gate, Newcastle.

These cottages were erected on the Walker Estate, Newcastle, and were awarded gold and bronze medals at the recent North of England Model Cottage Exhibition. The cost per pair, including architect's commission (5 per cent.), was £520. The external walls were 11in. cavity, faced with first quality Wallsend "Atlas" bricks and two coats Portland cement rough-cast, dashed with white Derbyshire spar. The roofs are covered with Green's special "French" tiles. The architect was Mr. Ed. Cratney, of Wallsend and Sunderland. The contractor was Mr. James McHarg, of Wallsend.

CISTERCIAN ARCHITECTURE.

Mr. John Bilson, F.S.A., the well-known architect of Hull, has written an exhaustive essay in the journal of the Royal Archæological Institute of Great Britain and Ireland, upon the subject of Cistercian Architecture. Although the Cistercian ideal was that of simplicity, and it was pursued significantly, this negative attitude, says Mr. Bilson, "was overmastered by the creative impulse of the twelfth century." In his essay he traces the growth of both, and their relation one upon the other, turning for his examples from Burgundy to Fountains, from Kirkstall to Byland, and other famous monastic churches. At the outset, he says we must guard ourselves against the misconception that there was ever any specially Cistercian style. What was specially characteristic in it arose from the Cistercian ideal of monastic life—simplicity and extreme asceticism. Gorgeous architecture and ornamentation were to the Cistercian monk of the earth, earthly. Naturally, therefore, in Cistercian buildings we find more or less uniformity, as in the pointed arch and the ribbed vault, and a general similarity of plan, though of course it was not possible for the Cistercians any more than for other innovators in architecture to ignore the building traditions of their time. In plan Kirkstall affords a typical example:—

A cruciform church, with a short presbytery or sanctuary to the east of the crossing; westward of the crossing of the long nave, the eastern part of which formed the choir of the monks (most frequently the monks' stalls extending into the crossing), and the western part of the choir of the conversi, chapels on the east side of each arm of the transept, and an aisle on each side of the nave to facilitate communication between the different parts of the church; such was the plan almost universally adopted in the golden age of the Order.

Variants of this plan, due to following local methods, are seen by reference to plans given of fourteen Cistercian churches. As to these local methods, Mr. Bilson remarks that considering the strength of local build-

RCHITECT.

ing traditions in the twelfth century, it is a testimony to the discipline of the Order that their church plans so generally conform to the standard type. With the help of many photographic illustrations, it is possible to follow the changes and varieties in ornamentation which were gradually introduced. In the main arcades and the doorways at Fountains and Kirkstall, Mr. Bilson discovers how the English love of mouldings overcame Cistercian austerity; in the windows, also, the earlier work is much the more severe. With these and other details, Mr. Bilson makes a study of our remains of Cistercian architecture more fascinating and more informing than ever. Summing up, he describes the architecture of Fountains and Kirkstall as, with few exceptions, entirely Anglo-Norman. It is only in the latest work, particularly of Kirkstall, that we find any trace of foreign influence.

STRENGTH TESTS OF CEMENT.

The cement industry has developed to such proportions that it is now one of those selected for study by many statisticians when they desire to discover the scientific laws of growth, when they search for signs of returning prosperity during periods of depression, or when they enumerate the great industrial factors of the day. But no industry can serve such purposes with precision until the manufacture and use of its product have been carried to such a degree of perfection and the specifications covering its production are so well understood and so widely accepted that a true standard or standards for it may be considered to have been fixed.

In the case of cement, in spite of the promulgation of so-called official standard specifications for Portland cement by such bodies as the American Society of Testing Materials, with its special committee composed of engineers, manufacturers, cement experts and large users, the American Railway Engineering and Maintenance of Way Association, the National Association of Cement Users, and the American Institute of Architects, there still exists a considerable variation in the cement specifications prepared for large engineering enterprises like the New York rapid transit work, the New York barge canal work, the work under the Philadelphia Public Works Department, the Catskill water supply work, various parts of the Pennsylvania Railroad work, and also between them and the official standard specifications mentioned above. Several different points might be mentioned, but there may be taken as a single example the stipulation exacting a large percentage of increase of strength in standard mortar briquettes between the 7-day and the 28-day results, which requirement is to be found in several of the specifications in the list enumerated.

The specifications of the American Society of Testing Materials simply require "no retrogression," while ratios of increase up to 25 per cent. are required for the sand tests and up to 10 per cent. for the results from neat specimens by the contracts covering the supply of cement for several well-known engineering enterprises. This wide range of values is due to two diametrically opposed conceptions of the properties which an ideal cement should possess. On the one hand the idea is held that the best cement is one which hardens slowly and continuously, and it is contended that a product, which shows a low strength at the end of seven days, so that it is apt to develop a considerable increase up to the 28-day test period and thereby produces the increase specified, is also a cement which is more likely to continue to increase beyond the 28-day period. As to the accuracy of the latter contention numerous tests alone can decide. On the other hand, the opponents of the slow-increase theory maintain that the best cement is the one which secures its full strength at a very early period and thereafter is subject to none of the chemical or physical changes which are involved in the yet unexplained process of hardening. They further claim that the results of tests do not show that a cement which hardens slowly is ultimately any stronger than one which secures an early high strength, and actually cite the published experiments of one of the earliest proponents of the slow-hardening theory, according to whose tests that cement which had been rejected under the stipulation mentioned developed higher tensile strength after several years than did the one which had hardened at a slower early rate.

From an entirely unprejudiced point of view, it would seem (says a writer in an American contemporary) as if the whole basis of the controversy were wrong. It is well known that cement and the concrete in which it is employed are almost invariably stressed entirely in compression, and that the relation which exists between the tensile and compressive strengths of a given sample changes greatly with time and the method of test, so that both cements, the slow and the quick-hardening, may each be entirely satisfactory under actual working conditions, in spite of the results of tension experiments. Obviously, the sole reason for the existence of any specification is the necessity of obtaining an article which will stand the tests of time and

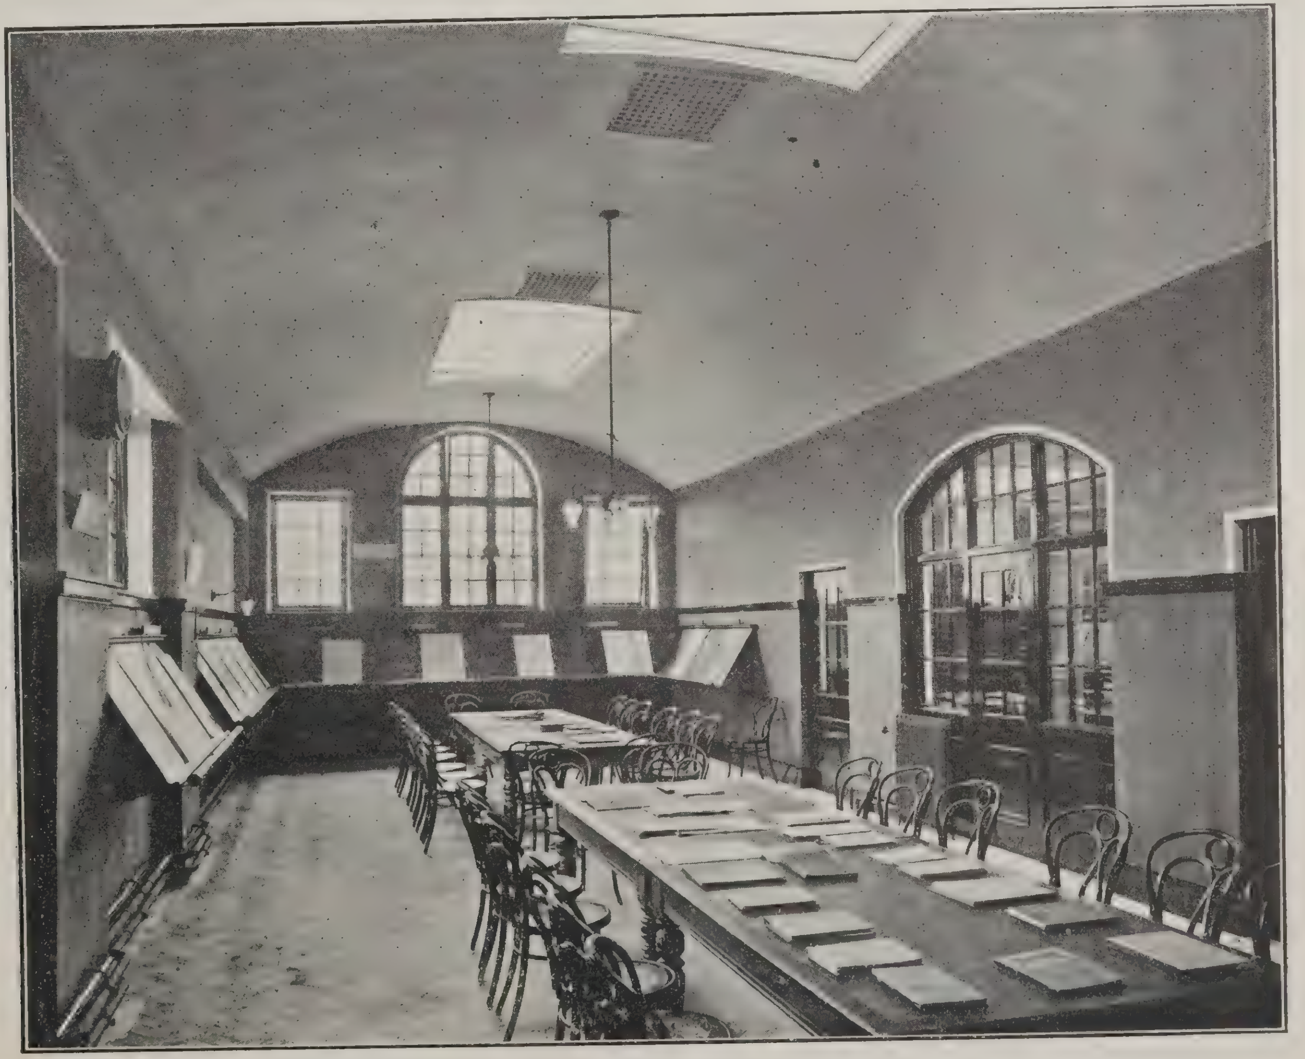

Photo: T. Lewis.

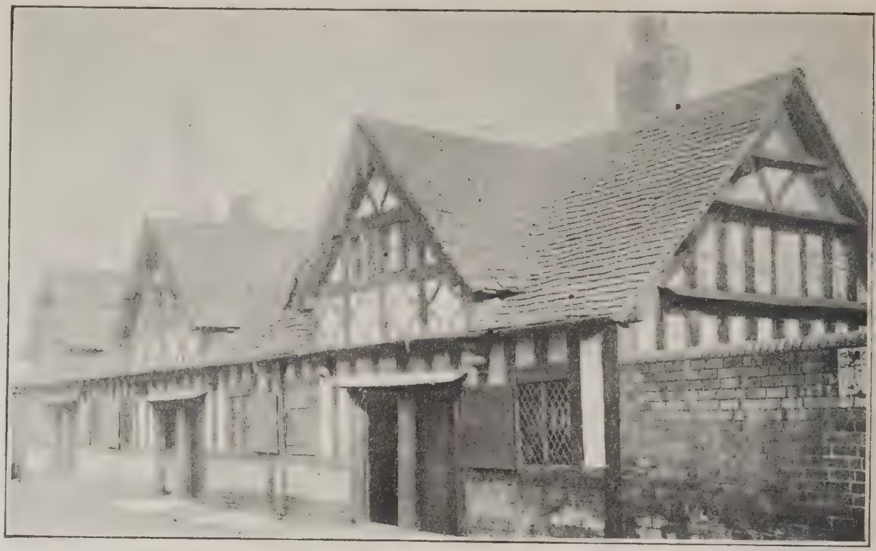
ANNFIELD PLAIN PUBLIC LIBRARY: THE READING ROOM EDWARD CRATNEY, ARCHITECT.

stress. Since it seems to be a fact that brands of cement of both classes have completely demonstrated their ability to withstand the requirements of long, hard usage in many well-known engineering structures which have stood for periods extending to a full score of years, it would appear as if a straw man were the present object of attack by both parties to the "rate of hardening" controversy.

The only pertinent question to be settled is a purely economic one. Are the existing specifications for public works so drawn that, while they may admit only first-class brands of cement, they at the same time exclude other equally high-class brands without protecting the work against anything which is inferior? Were such the case, the tendency would clearly be to prevent the fullest competition, and thereby perhaps permit an unnecessary expenditure of public funds because of a possible increase in price or through delays in securing regular deliveries of what amounts to a special article. Engineers throughout the country can render their profession and the public a high service by studying the condition of existing concrete structures of as great age as possible and reporting the matter through proper public channels, including as far as obtainable all pertinent data as to the characteristics and early behaviour of the cement employed. Only through a careful analysis of a large mass of such data can any final deductions be made as to the real value of this and some other clauses in existing specifications; the apparently perfect condition of the large majority of engineering structures argues nothing but good both for the simplification of present specifications and the permanency of the work which has been and is being done.



OLD ALMSHOUSES AT HEREFORD.

OLD ALMSHOUSES AT HEREFORD.

The accompanying illustration shows a row of six old almshouses at Hereford, founded in the year 1630 for six poor women, either

widows or spinsters, whose age must not be less than sixty years. The charity is endowed with buildings and lands adjoining. The buildings became very dilapidated a few years ago, but have since been entirely renovated. They have been measured and drawn by Mr. Herbert Skyrme, architect, of Hereford.

A NEW TILE AND CONCRETE FLOOR SYSTEM.

The use of tile or similar filling material in long-span reinforced concrete floor construction in order to get depth without increasing the dead load too much has been tried with slabs reinforced in two directions at right angles to each other. In using ordinary building tile for this purpose, however, some of the concrete flows into the open ends, which are necessarily kept apart in order to allow for the transverse reinforcing rods, and the dead load is thus increased without adding to the strength. To prevent this, various methods have been tried, consisting generally in plugging the open ends. Another system, recently developed, for overcoming the difficulty has been used in the new Lafayette Street School, recently built in Newark, N.J.

This system employs triangular tile units which are assembled to make squares, their diagonal edges thus fitting together and preventing the concrete flowing into the cellular spaces. The blocks may be made of any desired dimensions, but in the Lafayette Street School they were 6in. high and of such size as to make, when assembled, 12in. squares. The flanges at the base of the blocks around the outside keep the blocks spaced at the predetermined distance, and allow room for the reinforcing rods. The form work required consists only of a platform supported from below at the proper floor height. Upon this platform the blocks are assembled, the rods placed and the concrete poured on top and finished off in the usual manner. When the concrete has set the supporting platform can be removed, leaving a very rough surface, to which the plastering or fireproofing may be directly applied.

The columns in this school were spaced so as to give a slab measuring 25×21ft. in the clear, and one of these, when 28 days' old, was tested, according to the requirements of the Board of Education, by placing in the centre of the span a 7,000lb. concentrated load upon an area about 2½ft. square. The floor slab was 8in. deep, consisting of blocks 6in. high, with 2in. of concrete on top. The test was not intended to be a specially severe one, and would probably have been carried to higher loads if the contractors had not been rushed. However, the panel showed no deflection with this load, and the test was therefore discontinued. In the course of construction another panel of the same size when ten days old carried a load of 15 tons of structural steel without deflection.

The construction was designed by Mr. Ferdinand Burchartz, architectural engineer, New York City.

A THEATRE FIRE.

A short paragraph in the newspapers of last Friday announces that the Theatre Royal and Hippodrome at Barry Dock was burnt down on Thursday afternoon. It is added that "the building, which was constructed chiefly of wood, with steel girders, was erected three years ago." It is a short life, and we trust that it has been a very merry one. The materials of construction, however, as described in the newspaper paragraph, do not suggest the up-to-date precautions which might have been expected in so modern a building of this class. The risks and possible consequences of fire in theatres and music-halls are so great, that the best known fire-resisting methods should be invariably adopted in constructing and fitting them. In the interests of public safety, the law should insist that places of public amusement should be built only of those materials and upon those principles which ensure the maximum degree of resistance to fire. The ample provision of exits is in any case necessary, but it does not exhaust the responsibility of the authorities with regard to danger from fire. Only an extremist would claim that the means of protection are now so perfect that, where they are fully adopted, it is impossible for a building to take fire; but, nevertheless, that consummation seems to be not unattainable; and modern systems of construction bring us almost within reach of it. But a building "constructed chiefly of wood with steel girders," does not seem to carry us very far towards the realisation of that ideal.

The Norwich Town Council have decided, on the expiration of the existing contract with the British Gas Light Company (Limited), to substitute electricity for gas for the lighting of the city streets.

Fire Prevention Notes.

America's Example. The Americans are more alert that we to take prompt and full advantage of all that scientific and industrial progress can offer them. With regard to fire-protection, it may be that their very exceptional experiences of tremendous loss of life and property by fire have taught them wisdom. It is to them, at any rate, that we are accustomed to look for thoroughness in the application of fireproofing principles. The most efficient fireproofing methods and materials are now being generally employed not only for large commercial and industrial premises, and for public buildings of all sizes and descriptions, but also, as we have from time to time recorded, in the construction of private dwellings. With the Americans, the question is not whether a building shall be fireproofed, but which of the several systems of fireproofing shall be adopted. Some considerable time must perhaps elapse before we in this country arrive at the same state of grace, but we must keep on persevering towards that desirable goal. If, like the people who came under the influence of Mr. H. G. Wells's benign comet, we could suddenly wake up wise, one of the very first steps taken towards redeeming our unregenerate past would be the wholesale fireproofing of our buildings. This very literal method of setting our house in order would for years to come absorb every available unit of unemployment in the building trade. The revolution is coming; but, failing the magic influence of the comet, it will be effected very gradually, and by such commonplace means as the persistent advocacy to which we have for a long time periodically devoted a considerable amount of space.

Fire Drill in Schools. An example of the value of the "fire-drill" which is now being practised in every public elementary school in London was afforded one morning last week when a fire broke out in a class-room on the second floor of the Ann Street schools of the London County Council, Ann Street, Clerkenwell. The moment the danger was appreciated whistles were blown, a bell pulled, and while quick march music was played on the pianos the 400 boys and girls who were in the different class-rooms promptly formed up in twos and marched out into the playground, where they stood at attention in double rows. The fire having been extinguished, the children marched in again in the same orderly manner. That is splendid so far as it goes—especially the piano-playing, to which Nero fiddling whilst Rome burned is an unworthy parallel. But discipline is only the first step towards education. The authorities might with advantage go much further. There is, we believe, no practical subject that could be more profitably taught than the first principles of fire-prevention. The subject, properly handled, could be made extremely interesting, and would in itself become no mean instrument of mental development. That would be one direct educative gain; another positive and direct advantage would follow the knowledge of how to prevent and how to deal with outbreaks of fire; and the children should receive practical instruction in the use of the minor means of prevention and extinction. A less direct but even more valuable advantage would be the raising of a vast body of citizens possessed of enlightened views and awakened sympathies on the larger aspects of the question. In a word, the most effectual means of popularising fire prevention is to get hold of the children. As a writer in the "Times" once pointed out, "if the householder, in particular, would look upon the risk of fire much as he looks upon the risk attending inefficient sewers, the field of the inventor and the manufacturer would be much enlarged"; and the present school-child is potentially the future householder.

Fires in Churches. In America, churches are being built of reinforced concrete; one of the latest examples being the Church of Our Lady of Mercy, in the Borough of the Bronx, New York City. The church is of reinforced concrete, and a steel frame supports the roof. In this country, where we are overmastered by sentiments and traditions from which the people of a comparatively new country are relatively free, we are not likely to emulate this example to any great extent, and even to hint at such profanity is to run the risk of being accused of sacrilegious heterodoxy—hard words which, for our part, we would not cast at a marauding cat. We do not suggest, therefore, that Kirkby Malzeard Church, which has just been restored after very serious damage by a fire that occurred in February 8th, 1908, should have been safeguarded for all time from a similar catastrophe by rebuilding it in reinforced concrete. We do think, however, that, fires in churches being extremely numerous, it might be possible to construct new churches on more up-to-date methods than are commonly adopted for such buildings, and that this can be done quite decorously The extent of the damage at Kirkby Malzeard may be inferred from the statement that in the work of restoration, which has been carried out under the direction of Mr. J. Oldrid Scott, as much as possible of the old stone has been used, but the greater part is new. All the pillars of the nave have been renewed. The new oak roofs assume the same low pitch as that adopted by Sir Arthur Blomfield for the chancel, when he restored the church about thirty years ago, and the lowering of the roof has emphasised the dignity of the tower. New floors have been laid, and that of the chancel is of marble. Handsome wood screens have been designed by the architect, but these cannot yet be executed, for want of funds. The chief contractors are Messrs. Barker Brothers, of Hampsthwaite. We are unaware whether the cause of the fire at this church in 1908 has been ascertained. Of course, the origin of outbreaks in places of worship is usually attributed either to the heating apparatus or to the carelessness of workmen, who use blow lamps or brazing tools, or who indulge in profane smoking while at work; but all these dangers are remediable, and in the absence of details, it may be tacitly assumed that, in restoring the church, material safeguards from fire have not been neglected.

Law Cases.

London District Surveyor's Fees.

At the Lambeth Police Court, before Mr. Hopkins, Messrs. Galbraith Bros., builders, of Camberwell Green, were summoned at the instance of Mr. Bernard Dicksee, district surveyor for Newington and part of St. George the Martyr, who sought to recover from the defendants the sum of £16 7s. 6d., being fees which he alleged to be due to him in connection with the erection by the defendants for the London County Council of a new school for defective children adjoining the John Ruskin School, Beresford Street, Walworth.

The point raised by the case was whether fees were payable to the district surveyor in respect of the erection of the building in question. In the case of the "London County Council and Willis," the Divisional Court held that the district surveyor was entitled to notice under the Building Act. Under section 201 of the Act, "public buildings belonging to or occupied for public purposes" by the county council are exempted from parts 6 and 7 of the Act. In support of the claim set up by the district surveyor, the plaintiff contended that this was not a public building occupied by the council for public purposes, and submitted that it having been held that notice of such works must be given to the district surveyor it followed that the district surveyor was to discharge his duties and receive his fees.

On behalf of the defendants, the necessity was urged of getting some further elucidation of the London Building Act in regard to buildings which were constructed by the London County Council as the educational authority, and the duties of district surveyors in reference to such buildings, and what fees, if any, were payable to district surveyors in respect of such duties as they had in reference to buildings of that character, if any, under the statute. In the case of the "L.C.C. and Willis," the only question which the Divisional Court specifically dealt with was whether or no the County Council should have given a notice to the district surveyor. The defendant's first proposition was that the giving of notice did not necessarily carry with it a right on the part of the district surveyor to receive any fees. Secondly, that this particular building was exempted by reason of section 201 from the provisions of Parts 6 and 7 of the Act, and, thirdly, that if the district surveyor had no statutory duties under Parts 6 and 7, he was not entitled to fees.

Mr. Hopkins reserved judgment.

Financing a Building Operation.

In the King's Bench Division on November 15th, Mr. Justice Sutton gave judgment in the action of Gray v. The Central London Properties Association, Limited. His Lordship said the plaintiff was Mr. Charles Gray, a builder, of Kensington, and he brought the action to recover £12,500 alleged to be due from the defendant company as an instalment on account of a contract to rebuild certain property in Hanover Square for £38,000. It appeared that the contract was made through a Mr. Gilbert, and that the defendant company was to advance the money as the building progressed. Mr. Gilbert became bankrupt, and, as he had arranged mortgages on the property with the defendant company, it was contended that the latter was liable for the first payment of £12,500, which became due when the buildings reached a certain stage. On the other hand, it was said that the building lease and other securities were now the property of Mr. Gilbert's trustee in bankruptcy, and that Mr. Gray was really only Mr. Gilbert's agent. The defendant company had entered into an agreement to pay the plaintiff, in all, £25,000, secured on mortgage, and the whole dispute appears to have arisen out of the bankruptcy of Mr. Gilbert. He had come to the conclusion that the agreement with the defendant company was one for good consideration, and was irrevocable, and not affected by the bankruptcy of Mr. Gilbert. He therefore gave judgment for the plaintiff, with costs, and with interest at 5 per cent. Mr. Hastings, for defendants, applied for stay of execution with a view to an appeal. Mr. Disturnal, for the plaintiff, pointed out that it would be a great hardship if plaintiff was kept out of his money any longer. The company had the building and the securities, and plaintiff had received nothing. Had he not been a substantial man he would have been ruined over the transaction. He asked that he should not ke kept longer out of his money. His Lordship refused to grant stay of execution.

Decision as to Altar Tables.

By a judgment of the Consistory Court, heard in St. Paul's Cathedral on November 16th, the use of marble tops for altar tables was held to be illegal. The case arose on the application of the Rev. E. R. Hudson, rector of Hayes, for a faculty to erect a new altar with a marble top in his church, as a memorial to the late rector. Dr. Tristram, Chancellor of the diocese, held that a marble top was illegal. Regarding cases quoted, notably Westminster Abbey, where marble-topped tables were in existence, he said it had not been the practice of the Court to remove those for which a faculty had in the past been granted, and apparently in the case instanced, the Crown had the option of granting or withholding privileges. The marble slab already executed could make a base for the altar, if desired.

Proposed New Works.

BRISTOL.—The scheme for the restoration and extension of the Bristol Fine Arts Academy is to cost approximately £10,000. Building operations, it is stated, will commence, after the spring exhibition.

GATESHEAD.—A L.G. Board enquiry into the application of the borough of Gateshead to borrow £9,400 for the purchase of the West Duddo Estate, in the parish of Stannington, for providing accommodation for lunatics, has been held.

MAIDSTONE.—In order to provide work for some of the unemployed during the winter, Sir Marcus Samuel has decided to erect a new pavilion at Mote Park county cricket ground, at a cost of about £2,000.

PRESTON.—A L.G. Board enquiry has been held at the County Hall, Preston, into an application by the Lancashire County Council for sanction to borrow the sum of £20,000 for the extension of the County Office in Fishergate Hill. The site of the proposed extension has already been provided.

STEPPS.—Alternative plans have been submitted for an extension of Stepps School, by Mr. Fairweather, architect, of Glasgow. In the one case five rooms are shown, giving accommodation for 300 children. The other plan provides for a two-storey extension, giving eight rooms, or accommodation for 480 scholars. The first scheme is estimated to cost from £3,150 to £3,500, while the second is estimated to involve £4,800 to £5,200.

THORNE.—It is proposed to erect a school for 100 boys and girls, at a cost, including equipment, of £6,000. It was announced recently that, five acres of land were to be given as a site by the Governors of the Grammar School, and the County Council was willing to contribute £500—one-third of the estimated value. The annual maintenance was put at £1,300.

WINNIPEG.—The question of the construction of a new Provincial Parliament building is under the consideration of the Provincial Government. In all probability the construction of a new House will be begun early next year. The present legislative buildings have long been too small for the needs of the members, and inadequate to the position in the Dominion of the province of Manitoba.

Views and Reviews.

*Triggs on Town Planning.

There seems likely to be no want of light and leading on the highly important subject of Town Planning, on which so large an interest has been focussed by Mr. Burns's Bill. Mr. Inigo Triggs was first in the field with the excellent book now under review. Mr. Raymond Unwin's followed close on its heels, and other volumes are on their way. One may reasonably doubt whether there is a public numerous enough to absorb so much pabulum, and satisfy the authors and publishers. However, for the student it is all gain to have the subject attacked from varying points of view.

As is natural with one who has given so close an attention to formal design in gardens, to the enrichment of our libraries, Mr. Inigo Triggs leans markedly to the School of Town Planning which demands the grand manner. When architects have got more familiar with the problems involved, and the practical working of town planning schemes gives more material for criticism than England yet affords, it is likely that no small bickerings will arise. It needs no very abstruse or elegant spirit of prophecy to discern that the conflict will be waged between the classical and picturesque schools of thought. In that conflict we doubt not Mr. Triggs will be found on the side of the classicists. Indeed, from the fact that he dismisses Camillo Sitte with a short reference, it would seem that he has small sympathy with the town planners who base their schemes on the effects which abound in mediæval German towns. It seems clear, however, that the advocates of the grand manner, the disciples of l'Ecole des Beaux Arts, will have for some time small opportunity in England to exercise their art. It is unlikely that a nation, so indifferent to matters architectural as we are, is likely to contemplate any such schemes of remodelling as the Second Empire made possible in Paris. Such intelligence and effort as may be brought to bear will be exercised on suburban extension, and rows or squares or crescents of villas and cottages give small scope to large ideas, and must necessarily develop rather on village than on city lines. We think, therefore, that Mr. Triggs has been wise to devote an important chapter to town expansion, in which he describes Letchworth, the Hampstead suburb, and other healthy experiments and projects. On the larger aspects of town planning, Mr. Triggs acutely points out that the splendid foresight of Paris and its resolute carrying out of large projects on a definite plan over a long period of years has brought to the city a great access of material prosperity. If town planners can preach this gospel of "honesty is the best policy, *and pays best*," they are more likely to achieve results than if they hitch their waggon to the star of artistic righteousness. Until, however, there is such a change in the official attitude towards architects as manifested itself in the total ignoring of the profession in the matter of the Royal Commission on London Traffic, we incline to take a gloomy view. In no other nation would it have been possible for such a body to sit and report without a single architect, either as commissioner or witness. Mr. Triggs's book is large and long, and it is not possible to do more than touch on a few points that he raises. The gridiron plan is doomed: the experience of New York is evidence bitter enough as to its failure. It seems likely that the general lines of future city planning will run on a combination of the chessboard and radial schemes, for a purely radial system provides many sites of awkward shape. The question obviously needs to be approached from many sides, and much scientific observation of the behaviour of traffic, and especially of mixed speeds, will be needful before any sound body of doctrine is evolved. The gyratory traffic diagrams which Mr. Triggs reproduces are peculiarly provocative of thought. On the historical side the book is admirably equipped, though we think the plan of Silchester might have been included as the only perfectly explored Roman town in England. One piece of golden advice we trust may be followed; Mr. Triggs issues a warning against reliance on preconceived ideas. He quotes with approval the words of Stubben, "The day has gone by for the unqualified employment of definite systems; henceforth they should not play a ruling but a subsidiary role."

Of uniform treatment for streets leading to an important architectural termination, of arcades, of covered streets, of tree planting, and a thousand other things germane to his subject, Mr. Triggs discourses ably and in detail.

Of maps and plans there is an admirable series, while the photographs of Continental cities are not only valuable in themselves, but are calculated to produce in the minds of those who see them, that divine discontent which is the seed of reform. We hope architects will make themselves possessed of Mr. Triggs's accumulated knowledge, but still

STREET ARCADE AT BOLOGNA.
(From "Town Planning, Past, Present, and Possible.")

*Town Planning: Past, Present an Possible. By H. Inigo Triggs. 10 in. by 7½ in. pp. xx. 334. Illustrations 173 17s. net. London: Methuen and Co., 36, Essex Street, W.C.

more, that the official world will feel that they have no longer the excuse that none has preached to them.

Miscellaneous.

We have received "The Mechanical World" pocket diary and year book for 1910, now in its 23rd year of publication. It contains a large collection of notes, rules, tables, and data for mechanical engineers, and includes sections on:—Steam and the steam engine; steam turbines; steam boilers; gas engines; oil engines; suction gas producers; beams and girders; centrifugal pumps; ball bearings; notes on shafting, wheel gearing; belt driving; rope driving; wire ropes; notes on screw cutting; tapers and angles; and speeds and feeds for high-speed steel tools. Price:—Cloth, 6d. net; by post, 8d.; leather, gold blocked and gilt edges, 1s. 6d. net; by post, 1s. 8d. From any newsagent, or from Emmott and Co., Limited, 65, King Street, Manchester.

We have also received the year book of The Alberta Association of Architects, for 1909.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable and it must be understood that both question and reply will, as a rule, be published in these columns

Hammerbeam Roof Truss for Church.

Leicester.—P. H. G. writes:—"Do you consider that the accompanying section of a church roof truss shows sound construction?"

The truss has been redrawn, with additional bolts and plates, to cover the joints, and the insertion of a wall piece above the hammerbeam. This should make it satisfactory.

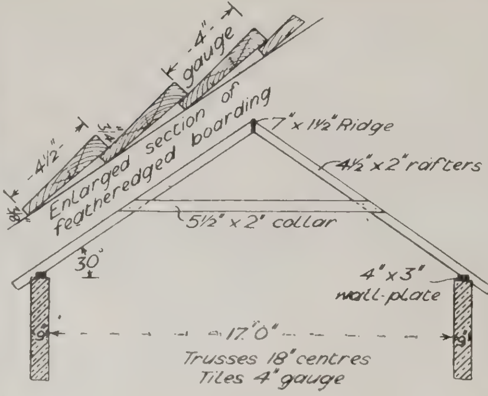
Henry Adams.

Roof Truss for Motor Garage.

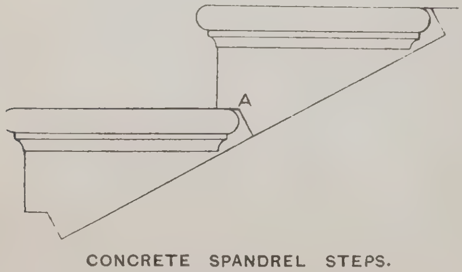
Kingston-on-Thames.—"B. G." writes: "A motor garage, 17ft. by 17ft. on plan, is to be erected. What are the smallest members that may be used in the roof? It is proposed to use wrought-iron rods or bars for all members except the principal rafters, which will be deal."

—There is no occasion for any ironwork in this roof; an ordinary collar beam truss may be used. This is formed as in illustration herewith, the trusses being not more than 18in. apart. If the spacing is increased, the scantlings must be increased also.

Henry Adams.



A MOTOR GARAGE ROOF.



CONCRETE SPANDREL STEPS.

Measuring Concrete Spandrel Steps.

Leicester.—J. A. L. writes: "The London Building Acts (Amendment), 1905, requires concrete spandrel steps for staircases 4ft. 6ins. wide to be not less than 4½ins. thick in the smallest part. Which of the modes shown in the enclosed sketch is correct?"

—Neither of the modes of measurement suggested is correct. The official measurement for least thickness is taken from point A on sketch herewith, and there must be at least 4½ins. in the shortest direction, which will be at right angles to the soffit. Spandrel steps are therefore an unsuitable shape for compliance with these regulations.

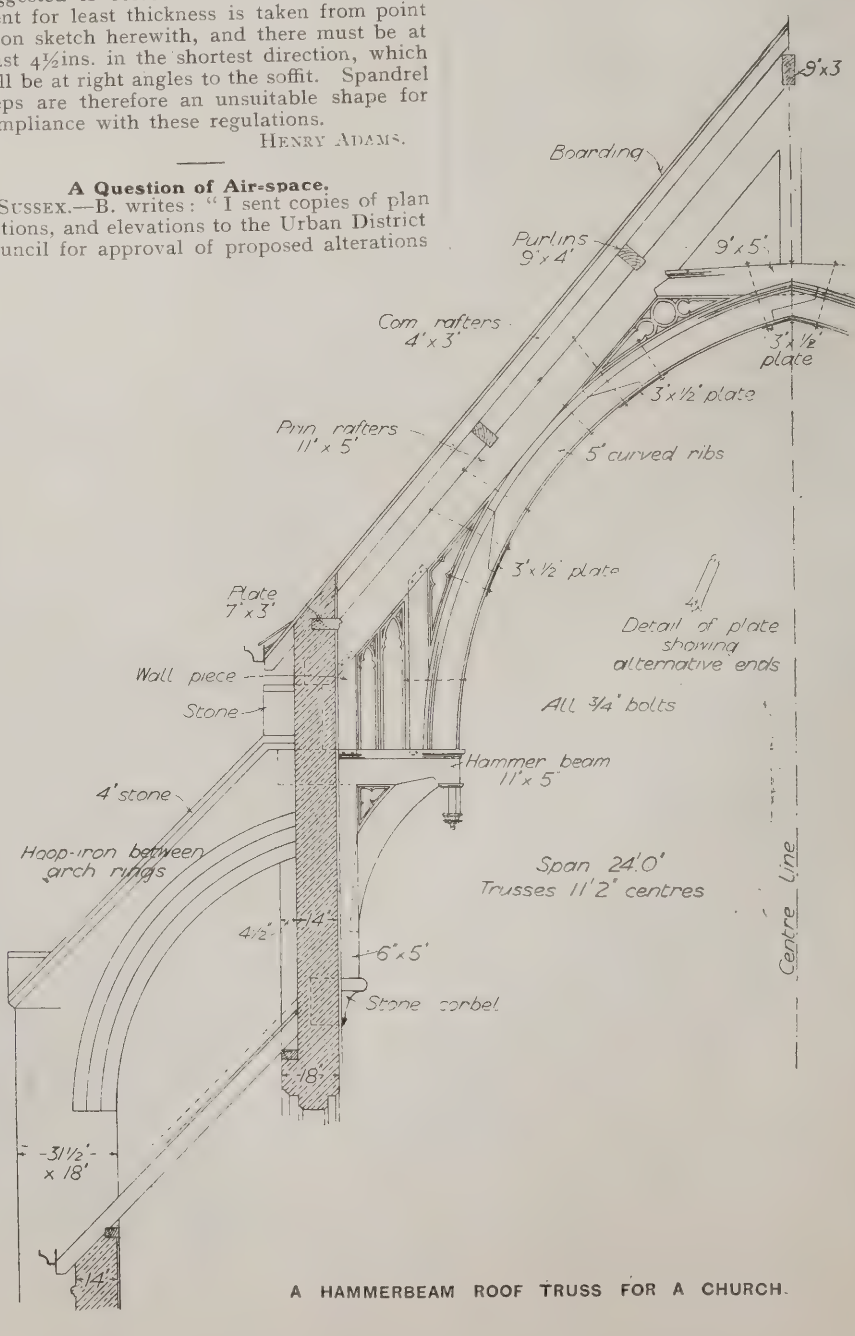
Henry Adams.

A Question of Air-space.

Sussex.—B. writes: "I sent copies of plan sections, and elevations to the Urban District Council for approval of proposed alterations and additions. They disapproved on the ground that there is not 24ft. free air space in front of same—A's garden intervenes. A has no objection to the alterations. Could I say the front was the back, and declare the 24ft. free air space facing the lawn and garden? Could you suggest any way of my erecting the proposed alterations and additions? And do you think the Council have taken a proper view of their by-laws?"

—So far as can be ascertained without access to the by-laws in force in the district in question, a by-law to the above effect is lawful, and may be enforced. S. 157 (3) of the Public Health Act, 1875, clearly provides that a local authority may make by-laws with respect to (*inter alia*) the sufficiency of the space about buildings "to secure a free circulation of air." It is not a question of ancient lights or blocking up windows. While it may well be that the adjoining owner has no intention of building on his land, this is not a fact of which the local authority can take cognizance. So far as that body is concerned, it cannot compel him to refrain from building. As to the plan submitted, there does not appear to be any very simple method of so altering it as to provide the necessary air space, and yet carry out the proposed alterations. It will not avail anything to call "the back" "the front," as "front," in relation to building by-laws, has a definite technical meaning.

Barrister.



A HAMMERBEAM ROOF TRUSS FOR A CHURCH.

Societies' Reports.

Glasgow and West of Scotland Technical College Architectural Craftsman's Society

At the third meeting of the session, held in the Technical College on the evening of the 5th inst., Professor Gourlay, B.Sc., A.R.I.B.A., read a paper entitled "The Building of a House." Beginning by defining building construction as the sum of all the building crafts controlled, as regards design, by the master mind of the architect, the Professor proceeded to treat his subject on the basis of this definition. He pointed out how fundamentally necessary it was that the student should study at least one entire building to enable him to appreciate the many varied processes which are involved in the construction of building. To emphasise this view, he then showed a series of slides giving complete working drawings for a country house, in which as many different constructional details had been included as possible, while maintaining the unity of the design as a whole. In conclusion, he urged the importance of all architectural craftsmen pursuing a general course of this nature in building construction.

The Institution of Municipal Engineers.

At a meeting held at Norwich, on Saturday last, the Eastern District Committee of the Institution was formed. Among those present were Messrs. S. G. Bloy (Mutford and Lothingland) in the chair, Thomas Brown (Norfolk), R. G. Coates (Norfolk), R. Croome (Cromer), B. Gibson (Norfolk), H. G. Kaines (Norfolk), Robert Nelson (Norfolk), Andrew Patterson (St. Faith's), and D. S. Scoones (Norwich), together with Mr. B. Wyand, secretary of the Institution. Mr. J. H. Webb, borough surveyor of King's Lynn, was unanimously elected district chairman, and Mr. R. G. Coates, district surveyor of the Norfolk County Council was unanimously elected honorary district secretary. It was decided that, subject to Mr. Webb's approval, the first meeting of the committee should be held at King's Lynn.

Illuminating Engineers.

Professor Silvanus P. Thompson, presiding last week at the inaugural meeting of the Illuminating Engineering Society at the Society of Arts, said that in these days when so many associations existed for the diffusion of knowledge, the founders of a new society must be prepared to show either that there had arisen some new science, industry, or art, or that in the organisation of sciences, industries, or arts there had arisen some real need which the existing societies failed to meet. He had no hesitation in asserting justification for the existence of that society. It was founded to bring together all those interested in the problems, practical and theoretical, of the art of directing and adapting light, that prime necessity of civilised and uncivilised existence. To utilise light properly without waste was the business of those who would join that society; they were concerned with many things other than the mere production of light. Illuminating engineers were engaged in the utilisation of light in illumination; to spread knowledge about this was one of the objects of that society. No society had hitherto been organised to promote the interests of illuminating engineering. For only one hundred years had there been any systematic means of illumination in use in any civilised country, and for only about half-a-century had there been any real development of organised illumination. All the newest things in gas lighting and electric lighting were the efforts of only a few years. We were in the middle of an immense revolution. Illuminating engineers dealt with lighting rather than light; their primary concern was the adequate and proper illumination of things. Foremost in the programme of the society was the question of measurement; agreement, national and international, was required as to what should be taken as the unit of light. Information was wanted as to the specific brightness of surfaces of different kinds when subjected to light. The lighting of schoolrooms was all-important. The bad results which came from the imperfect illumination of schools was much to be deplored, for they imperilled the eyesight of the next generation. The first paper to be discussed before the society would be on the subject of glare and its avoidance. There were plently of questions of public, private and scientific interest for the consideration of the society, which he thought would have a great future.

Mr. L. Gaster (hon. secretary) read the report of the Council, which showed that the society started with a membership of 164 and a large number of prominent vice-presidents.

On the proposition of Sir Boverton Redwood, the president was thanked for his address.

Here and There.

Canterbury Contentions. Mr. W. D. Caröe, in a letter to "The Times" of the 17th inst., has replied to one or two criticisms of his statement of November 4th on the Angel Steeple, Canterbury. Mr. Caröe admits an inadvertent slip in writing of the work of facing the Norman piers as by Chicheley, when he meant Archbishop Courtney, who provided the funds for Prior Chillenden to rebuild the nave. But as Courtney, Chillenden and Chicheley were all in the world together, this inadvertence in no way affected the architectural issue. Mr. Caröe says he described this casing of the Norman work "in so vivid a manner," proclaiming the "complete separation between the old and new [work] wherein no mortar, as far as could be seen, had clung to the older work," that his statement does not seem capable of misconstruction. This is in disproof of Mr. St. John Hope's thesis that the perpendicular casing was built against the Norman work, and that the space found by Mr. Caröe between the casing and the original piers was not intentional, but due to buckling as a result of undue stress on the newer work. Mr. Caröe adds:—"As to causes and effects in a piece of work imposing on the mediaeval builders problems of much technical difficulty, a practical knowledge of building is a useful antidote to hasty conclusions."

Mont St. Michael. Before the Manchester University on the 15th inst, Professor Capper delivered a lecture on Mont St. Michael, probably the most unique of all Benedictine Abbeys, situated on the north coast of France at the junction of Normany and Brittany. Illustrating his subject with lantern slides the lecturer showed views of typical Benedictine abbeys in England, or what remained of certain of them in Durham and Canterbury, and said that Chester Cathedral gave them a very fine opportunity, near Manchester, of studying what one of these ancient buildings was like. Discussing the domestic buildings of Mont St. Michael, he showed the remains of the early architectural work of the twelfth century, and especially the crypt on the north wing by Abbot Roger II.; and then discussed in detail the grand building on the north side of the abbey, known as La Merneille, erected from 1203 to 1228, and which took the place of the earlier building which was apparently destroyed in the Breton revolt under Theuars in 1203. He drew attention to the fact that in building this particular abbey the monks had made unusual arrangements owing to the peculiar exigencies of the site, the almonry and the guest-house, as well as the more private buildings of the monks, such as the cellarium, the day-room, the refectory, and the cloister being in three grand stories towering on the north side of the structure. In conclusion he pointed out the severity and lack of ornament which characterised all the architecture of the buildings, and said the whole had seemingly been designed and carried out for a utilitarian point of view; and suggested that this went far to dispose of Ruskin's theory that ornamentation should be an essential characteristic in architecture.

"The City Beautiful." Mr. Edmund Rathbone delivered a lantern lecture, in the Picton Hall, Liverpool, on the 16th inst., on "The City Beautiful; or, Liverpool Compared with Cities Old and Modern." The lecturer referred to the recent formation in Liverpool of a society called the city Guild, whose object is was to assist in the preservation and increase of the natural and structural beauties of the city and neighbourhood, by securing public interest in these matters, its objects being to advocate improvement schemes, to advise in regard to the rebuilding of old districts and the laying-out of new ones, the placing of public monuments, and the regulation of hoardings and advertisements. The society was anxious to encourage the provision of open spaces, the cultivation of trees, and the abatement of the smoke nuisance, and to render assistance to the public authorities, if required, in the selection of works of art, and to support public performances of music. In Liverpool they were indeed fortunate in having such fine buildings as the Dock Board Offices, the Royal Insurance Buildings, and the Liverpool Exchange to adorn their city. Many of their best buildings, however, were marred by blatant advertisements, and the noblest architectural compositions were ruined by huge announcements, which distracted the eye and made their streets hideous. The depressing pall of smoke hanging over the city soon blackened their yellow stone buildings and neutralised every effort of those who would create a city beautiful. From his own office window the lecturer could see the chimneys smoking away furiously all day long. He believed that all this was preventable. Everywhere the beautiful flowers, shrubs, and grass were railed in in prison-like fashion, and the children could hardly see them at all. People must be educated to take care of the public gardens themselves, and he believed that they would learn to respect their common property if encouraged to do so by the authorities. He understood that in Paris trees were not planted out until they had grown to a considerable size, and that great precautions were taken in their removal. Indeed, a special official was set apart to look after the trees of Paris.

The Strength of Coke Breeze and Stone Concretes. Tests of coke breeze and stone for concrete aggregates have been made by an engineer in Elkhorn, Virginia. The breeze weighed 27lb. per cubic foot, the specific gravity was 0.905, percentage of voids 49.28, and water absorption 30.9 per cent. Ordinary cement and sand was employed, and as test pieces nine mine props were constructed, 8ins. in diameter and 30ins. long. Four mixtures of cement, sand, and breeze were made, and the initial loads were 1,000 lbs., with increments of 5,000 lbs. The following results were obtained:—

	Cement.	Sand.	Breeze.	Breaking load in lbs.	Strength in lbs. per sq. in.
Mixture 1	1	2	3	85.567	1,699
,, 2	1	2	4	88.167	1,752
,, 3	1	2½	5	79,334	1.576
,, 4	1	3	6	59.750	1,187

The figures for the stone concrete were furnished by Professor E. J. McCaustland, at Ithaca as follows:—

	Cement.	Sand.	Stone.	Breaking load in lbs.	Strength in lbs. per. sq. in
Mixture 1	1	2	3	151,100	1,872
,, 2	1	3	4	122,200	1,472
,, 3	1	2	5	128,100	1,483
,, 4	1	3	5	120,933	1,504

The Wrong Way to Build. The Camberwell Guardians require a temporary building for the accommodation of workhouse nurses, and it was recommended that, subject to the approval of the Local Government Board, a temporary iron building should be erected, the work to be done by the carpenter, with inmate labour, and with the help, if necessary, of one or two outside assistants. This is altogether the wrong way to build, and it is gratifying to note that the recommendation was not passed without an important modification in favour of open tendering. It was urged in vain by one of the members, Mr. St. Cedd, that the building should not be lined with wood, but with some fireproof material, and his citation of the case of Colney Hatch in evidence of the danger of wood-lined buildings was lost upon the Guardians; but the objection by Mr. Pegler that the work should not be carried out by inmate labour seems to have had a direct effect upon them, for ultimately it was decided to invite estimates for the supply and erection of the building.

The Property Market Index. The estate market affords a rough-and-ready index to possibilities in the building trade, which, to some extent, moves in sympathy with it. It is therefore reassuring to know, on the authority of the "Times," that "the undertone of the market is not unsatisfactory," and that "signs are discernible that, with a clearing of the political atmosphere, there will be a revival of activity." The aggregate transactions at the Mart, in the country and suburban sale-rooms, and privately, as reported to the Estate Exchange, this year are £5,839,229, against £5,259,258, in the like period of 1908

AN IMPROVED SYSTEM OF BRICKLAYING.

Concrete has made such rapid progress during the past few years, and has, in so many cases, proved such an important competitor to bricks as a building material, that it is of the greatest importance that all interested in the use of bricks should use their best endeavours to reduce the cost of bricklaying to a minimum, without in any way decreasing the stability of the structure, if this is at all possible.

A number of variations from the ordinary practice which have been made by Frank B. Gilbreth in the United States are of more than passing interest. Mr. Gilbreth has for some years had a high reputation for rapid erection, and is one of the most successful contractors in America, and he has brought to bear upon the subject of bricklaying a wealth of ideas and suggestions that are remarkable not only for their novelty, but for their practical value. His national reputation for the execution of large contracts in a phenomenally short time is a guarantee of the success of his methods.

The Scaffol'.

In the first place, the scaffold used by Mr. Gilbreth is arranged in such a manner that the bricklayer does not need to stoop unduly over his work; the argument being that as a carpenter does not stoop to the floor to plane a piece of wood, but works with the wood on a bench, so the bricklayer should work in a position best calculated to enable him to work with the greatest possible speed and with the least waste of energy by unnecessary movement. The Gilbreth scaffold is so constructed that it can be raised and lowered so readily that the workman does not need to stoop an inch lower than the height best fitted for his work.

The Fountain Trowel.

A further saving of time is effected by the use of a special trowel, which is as different from an ordinary one as a fountain pen is different from a pen of the ordinary kind. Just as a writer may increase the speed of writing by using a fountain pen and so avoiding the frequent journeys to the inkstand, so the bricklayer working on the Gilbreth system may save nearly a quarter of his time by discarding the ordinary trowel and using one with a much larger supply of mortar—in other words, a fountain trowel. Such a trowel is in the form of a long can, somewhat resembling a shoe, one end of which is flattened so that it may be used to scrape or scroop up the mortar in order to fill the trowel, whilst the other end has an opening so adjusted as to give a stream of mortar of the correct width. It is claimed that this device enables the mortar to be spread much more rapidly and evenly than usual, and it permits the mortar to be used sufficiently soft to fill the joints better than usual, particularly in the middle of the wall.

The "Packet" System of Bricklaying.

In the ordinary method of bricklaying, a large amount of time is lost by unnecessary handling of bricks by the bricklayer. Much of this is avoided by Mr. Gilbreth in what is termed the "Packet" system. This consists in the substitution of a definite arrangement of the bricks directly they leave the cart which delivers them on to the site, so that, with a minimum of handling, they are ready for laying.

For this purpose a small wooden pallet or tray is filled with bricks on edge in two rows of ten each, this work being done by labourers. The "packets" are then carried to the bricklayer, who picks up the bricks one at a time and places them on the wall. The time saved by the layer not having to select his bricks (front bricks can be piled in separate packets) nor to pick up parts instead of whole bricks is very great, as the sorting can be done by less highly paid labourers, each kind of brick being placed on a separate packet. Mr. Gilbreth states that he has proved by long practice that a bricklayer's output may be doubled by the adoption of this simple system, and the saving on the cost of laying is still further reduced by the saving in handling the bricks in packets as compared with the ordinary method.

Thus, everyone who has watched a bricklayer at work knows that he turns a brick about in his hand before laying it. This is necessary for him to find the best face, and to grasp the brick properly for laying. In the "packet" system, the bricks are so laid as to be in exactly the right position for laying, and all this unnecessary handling is avoided.

In these ways the system of working adopted by Mr. Gilbreth is capable of effecting a mild revolution in bricklaying, and one which is not likely to be resented by any one, as the bricklayer works less although he lays more bricks, and no reduction in actual wages takes place. The great difference is that time and energy which are now wasted are devoted to bricklaying, and consequently the employer benefits as well as the men.

COST OF CONCRETE BUILDINGS.

Reinforced concrete will generally run from 5 to 15 per cent. higher in first cost than first-class mill construction, and will be from 10 to 20 per cent. lower than steel construction fireproofed. A large warehouse in Brooklyn was begun in May, 1908. At that time new construction work was scarce, and all contractors figured very closely. The successful reinforced concrete figure was $30,000 lower than the best bid on the same plans in fireproofed structural steel. A large factory in Philadelphia was designed in steel. The architects considered an alternative in reinforced concrete and saved $60,000. A large publishing house and loft building was recently completed in Springfield, Mass., of reinforced concrete throughout, thereby saving $40,000 over the probable cost in steel. These three instances represent respectively savings of 12, 25, and 10 per cent. In competition with mill construction the percentage depends almost entirely on the size of the building. For structures costing $40,000 and less, and of a height of four stories or less, the brick and wood construction will run about 15 per cent. less than concrete. On larger buildings, however, concrete gets closer to the cost of the mill construction. The designers of a very large hardware building in Minneapolis were surprised to find concrete figures slightly under those of mill construction. A similar case occurred in Toledo, Ohio. Both of these propositions exceeded $150,000 in value.

In considering the costs of different types of construction the initial cost should not be the only criterion. There are certain fixed charges which enter into the relative values of buildings. These may be briefly summarised as follows: Insurance, maintenance, depreciation, amount of light available, freedom from vibration, elimination of vermin, and the assurance that a fire cannot destroy the building. It is difficult to put an exact monetary value on these different items. Each plant manager would have his own views and local conditions would alter materially any assumptions. If, however, due consideration be given to the saving which can be obtained on each of these items by the use of reinforced concrete building, it will generally be found that even though the concrete structure cost complete 10 per cent. more than mill construction, there will be a saving annually of from 1½ to 2 per cent.

These conclusions were drawn by Mr. J. P. H. Perry, of New York City, in an address on the use of reinforced concrete for textile mills, at a convention of the (American) National Association of Cotton Manufacturers.

Federation News.

Northern Counties Federation.

A meeting of the Executive Council of the Northern Counties Federation was held at the Douglass Hotel, Newcastle-on-Tyne, on November 15th, Mr. J. Davison (Stockton-on-Tees), president, in the chair, when there were fourteen members present.

Arising out of the minutes, a report was given by the Teesside secretary on the question of the alteration to the Teesside working rules, which were to be further discussed by them at a meeting with the operatives to be held on November 16th.

A letter received from the Quarry Owners' Association of the Tyne district, was read, intimating that as a result of a demand for a reduction of the wages of their workmen (other than stonemasons), the men had come out on strike, and asking for a conference with the Federation upon the matter. A deputation was received from the Quarry Owners' Association, when a mutual understanding was arrived at between the two bodies to assist each other in cases of necessity, and for the observance of their respective working rules.

The secretary read the correspondence which had passed between the Northern Centre, the Yorkshire, and this Federation with respect to uniform rules for the three Federations comprising the Northern Centre, and reported that he expected the secretary of the Northern Centre would be calling a meeting to discuss the form of rules previous to bringing them before the Federations. The action of the secretary in corresponding upon the matter was confirmed.

The question of the issue of a year book was considered, along with the different quotations. After considerable discussion, on the motion of Mr. J. W. White, seconded by Mr. Masters, it was resolved "That, providing £20 of advertisements can be secured, the issue of the Year Book be proceeded with."

A communication received from the National Federation was read with respect to a Departmental Committee on Railway Agreements, together with correspondence thereon, asking this Federation to give evidence upon any grievance they might have. As the South Shields Association had taken up the question very strongly, after discussion, on the motion of Mr. J. W. White, seconded by Mr. W. B. Cooper, it was resolved "That the South Shields Association be asked to appoint a witness to attend before the Departmental Committee."

The secretary's application for an allowance for office rent and expenses was considered, and after discussion, during which appreciative remarks were made in reference to his services on behalf of the Federation, it was unanimously resolved "That the Board of Representatives be recommended to increase the secretary's salary by £30, and that a grant of £30, be made to him for the current year."

The president made reference to the death of Mr. Henry Allison, senior partner in the firm of Messrs. Allison Bros., Middlesbrough, and moved a vote of condolence with his family; the members acquiesced by standing silently.

A communication had been received from the National Federation dealing with the conditions under which tenders are sent in, and asking for suggestions which would be considered at a conference between the National Federation and the Royal Institute of British Architects. The idea is that, if practicable, there should be an agreed form of tendering, just as there is an agreed form of contract. It was resolved "That a circular be drawn up and forwarded to each member asking for any suggestions for the regulation of the conditions under which tenders are required to be sent in."

It was decided to pay the subscription to the "Builders' Journal" for those individual members whose subscription amounted to more than one guinea.

Accounts amounting to £85 1s. 4d. were passed for payment.—W. H. Hope, solicitor, secretary, Post Office Chambers, 14, Norfolk Street, Sunderland.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The ordinary monthly meeting of the Bristol Association was held on Thursday, October 28th, when Mr. Frank N. Cowlin presided over a rather small attendance of members.

The president, referring to the matter of publication of lists of tenders to unsuccessful competitors after the signing of the contract, stated that he had been unable to see the town clerk on the matter, owing to the illness of that gentleman. He had, however, put himself in touch with the city engineer, the city valuer, and the secretary to the Education Committee, in regard to this matter, and hoped to be able to report to the next meeting that the authorities concerned would fall in with the wishes of the members upon the question.

A letter was presented from the hon. secretary to the Bristol Society of Architects, stating that his society would be happy to meet the members of the Master Builders' Association to consider any matters which tend to maintain and strengthen the good relationship which exists in the carrying out of building works, and asking for an outline of the points for consideration, so that same might be brought forward at the next council meeting. Very careful consideration was given to this matter, and eventually it was decided to submit the following points:—Taking out own quantities, the £1,000 limit; tendering for time and money; attendance on other trades; list of tenders.

With reference to the first-mentioned subject, the president stated that London had agreed with the architects on a £500 limit, and, further, he had received a letter from the Bath Association, whose limit of value for tendering without quantities was £300, asking whether any alterations were contemplated in Bristol, as, if so, they hoped that efforts would be made to bring the rules of the two centres more into line. This he had duly acknowledged, intimating that the matter was receiving the attention of the members.

The sub-committee appointed at the last meeting to go into the question of the adoption by this association of a telephone card similar to that in use in certain other centres, presented their report, from which it appeared that they did not consider they could recommend the issuing of such a card bearing a resolution asking members to give preference, wherever possible, to firms whose names appeared on the card, as this might lead to some of the smaller firms becoming hon. members of the association in the anticipation of increased business, which might not be fulfilled. The idea of a telephone card for the use of members was, however, considered a good one, as it was convenient to have the numbers most in use compiled in a concise form, and accordingly the committee recommended that such a card be prepared, bearing the names of the members of the association, together with hon. members, and their telephone numbers. General details were left in the hands of the president.

A communication was read from the Operative Bricklayers' Society, complaining of the employment of specialists for pointing work, which they considered should be the work of those who had built the structure, and asking that the following should be included in the working rules:—"That pointing work shall be the work of trowel hands, and be done in conformity with the hours of labour, rates of pay, and all other rules as agreed between the Master Builders' Association and the operatives. When any job is ready for pointing, the required number for the work shall be selected from the trowel hands who have built the structure." Careful consideration was given to this request, but it was felt that the masters could not agree to the inclusion of such a rule, and it was decided to so inform the society.

WAKEFIELD AND DISTRICT ASSOCIATION.

The monthly meeting of the Wakefield and District Association was held at the Great Bull Hotel, Wakefield, on Thursday, November 4th. Mr. Tom Lee (president) was in the chair.

The minutes of the last meeting were read and confirmed, and the minutes of the meeting of the Yorkshire Federation Executive Council held at Selby on October 21, which had been attended by Mr. Lee (president), Alderman Judge, and Mr. G. Clements on behalf of the Association were also read and discussed.

The amended form of sub-contract, which had been forwarded by the Yorkshire Federation for consideration, was gone through, and certain suggested alterations and amendments were formulated for the consideration of the Executive Council.

On the motion of Mr. J. Pashley, seconded by Mr. H. Fallas, it was unanimously decided to send a cordial invitation to the Yorkshire Federation Council to hold their next meeting at the Great Bull Hotel, Wakefield, on November 18th.

Mr. Pashley also proposed, and Mr. Fallas seconded, the election of the President (Mr. Lee) and Mr. H. Gillott to audit the accounts of the Association for the current year, which are to be submitted to the annual meeting in December.

The nominations of the officers to be elected at the annual meeting for the ensuing year were submitted, and with regard to the presidency, it was unanimously decided to invite Councillor Spink to take that position.

During the meeting Mr. H. Fallas warmly thanked the members for the sympathy which had been extended towards him in his recent sad and severe bereavement.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The monthly meeting of the Barnsley Builders' Federation was held at the King's Head Hotel, on Wednesday, November 10th, Councillor C. Haigh, president, occupying the chair, was supported my 23 members.

Important correspondence was dealt with, a copy of the amended builders' sub-contract agreement form and an urgent appeal by the secretary of the Yorkshire Federation with respect to overdue levies to the National Reserve Fund receiving special attention. A special levy has been made by the Barnsley Federation for contribution to the National Reserve Fund, and the treasurer promised to forward the amount due as quickly as possible. The copy of the amended builders' sub-contract agreement was submitted by the vice-president, but owing to the very important and far-reaching nature of the clauses contained therein, the general feeling was that a haphazard discussion would militate against the successful support and adoption by the Barnsley branch, a resolution being approved of for a special and careful discussion at the next monthly meeting. An unfortunate dispute between two prominent members with respect to an alleged unfair procedure in the letting of a certain sub-contract occupied the attention of the members for a great portion of the evening. The general feeting prevailing, however, was that whilst the member was fully justified in bringing his grievance before the meeting, yet it was thought that the grievance could easily have been disposed of satisfactorily to both parties, and an amicable settlement effected, without the intervention of the Federation, the whole case resting upon an unfortunate misunderstanding between a verbal and an official estimate. The election of officers for 1910, resulted as follows:—President, Mr. E. Broley; vice-president, Mr. C. D. Potter; junior vice-president, Mr. H. Ashworth; hon. treasurer, Mr. H. Ashworth (re-elected); hon. secretary, Mr. J. Denton (re-elected); auditors, Messrs. F. Goodyear and J. A. Binns; delegates to the Yorkshire Federation, etc., Messrs. E. Broley and C. D. Potter.

Copies of the "Builders' Journal" were handed round to non-subscribers during the evening with a view to inducing them to become subscribers.

NOTTINGHAM ASSOCIATION.

Secretary: W. J. Barton.

Nottingham Association has received a six months' notice for alteration of working rules from the Operative Bricklayers' Societies and the Builders' Labourers' Society.

A few particulars of the alterations suggested by the operatives will no doubt be of interest to other districts besides our own. The bricklayers are asking 10d. per hour, whereas the wage at present is 9d. per hour. They are also asking that the rate for night work where two gangs are employed shall be 1s. per hour. At present the rate in this case is subject to arrangement between the parties. As a set-off against the increased rate asked for, the workmen omit our present walking time rule entirely. This rule fixes the starting point at 1½ mile radius from the centre of the city except in one direction, where the radius is increased to two miles, and the radius to which these rules apply extends to four miles from the centre. Another clause asked for by the bricklayers is that in future only bricklayers shall be recognised as foremen over brickwork. The builders' labourers suggest 7½d. per hour against the present rate of 6½d., and they also introduce restrictions as to the number of bricks that a labourer shall carry. the present rule being 9 bricks all round till the walls of any buildings are 30ft. from the ground, and one brick less above that height, and they now ask that the rule shall read: "Labourers shall carry nine common bricks, eight facings, and eight blues," up to a height of 30ft., and one brick less above that height.

Another stipulation is "That brickwheeling to bricklayers is strictly prohibited." At present there is no restriction of this kind.

The labourers ask for 1½d. per hour additional for night work when two gangs are engaged, whereas the present rule is for ¾d. per hour extra. The labourers also omit any reference to walking time rule, which is on the same lines as that with the bricklayers.

In our leading columns, attention is drawn to the educative work which is being done by the Nottingham Association. Lectures on subjects of technical interest to builders have been given; and apprentices are being encouraged to study by the offer of prizes.

Coming Events.

Wednesday, November 24.

Architectural Association.—Conversazione, 18, Tufton Street, S.W., 8 p.m.

Manchester Society of Architects.—Mr. P. M. Oliver, B.A., on "Ancient Lights."

Thursday, November 25.

The Concrete Institute.—Royal United Service Institution, at 8 p.m. sharp. Mr. Richard L. Humphrey, M.Am.Soc.C.E., of Philadelphia (secretary to the American Joint Committee on Concrete and Reinforced Concrete), on "Some points relating to Reinforced Concrete as applied in America."

Friday, November 26.

The Architectural Association Debating Society.—Debate on "Open" Competitions (supported by Mr. K. Gammell) versus "Limited" Competitions (supported by Mr. W. G. Wilson).

Monday, November 29.

R.I.B.A.—Business Meeting.

Tuesday, November 30.

Manchester Society of Architects.—Students' Meeting. Mr. E. B. Norris on "Palladio of Vicenza and his School." Chairman: Professor Capper. 6.30 p.m.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 9th paper, "The Parthenon, Athens," 4.30 p.m.

Monday, December 6.

Liverpool Architectural Society.—Mr. C. H. B. Quennell, F.R.I.B.A., on "The Development of Suburban Estates."

Tuesday, December 7.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 10th paper, "Origin and Evolution of the Ionic Order," 4 p.m.

Institute of Sanitary Engineers.—Students' Meeting. Mr. A. J. Martin, M.Inst.C.E., on "Sewage Disposal," 7 p.m.

Wednesday, December 8.

Northern Architectural Association, Newcastle.—Council Meeting, 7 p.m. Ordinary Meeting: Mr. John W. Simpson, F.R.I.B.A., will read a paper, 7.30 p.m.

Royal Sanitary Institute, 90, Buckingham Palace Road, S.W.—Discussion on "The Collection and Disposal of House Refuse," opened by Mr. John S. Brodie, Borough Engineer, Blackpool, 8 p.m.

Manchester Society of Architects.—Mr. Henry Wilson on "Workmanship."

Friday, December 10.

Architectural Association.—Mr. F. C. Eden, on "Varallo, Orta, and Varese," 7.30 p.m.

Monday, December 13.

R.I.B.A.—Professor A. D. F. Hamlin, on "Architectural Education in America," 8 p.m.

Tuesday, December 14.

National Federation of Building Trade Employers.—Meeting of Administrative and Journal Committee.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 11th paper, "Origin and Evolution of the Corinthian Order," 4.30 p.m.

Institute of Sanitary Engineers.—Students' Meeting. Mr. Geo. W. Chilvers, M.R.San.I., on "Practical Heating and Hot Water Supply to Buildings," 7 p.m.

The Trades' Training School, of 153, Great Titchfield Street, W. Presentation of prizes at the Carpenters' Hall, London Wall, by the Duke of Argyll, K.T., etc. 8 p.m.

Tuesday, December 21.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 12th paper. Seventh and concluding lecture on "Greek Architecture." End of Michaelmas term. 4.30 p.m.

Trade and Craft.

Suggestions for Decoration.

A book that is no less useful than it is interesting, has been issued under the modest title of "A Few Suggestions for Ornamental Decoration in Painters' and Decorators' Work," by Messrs. Thos. Parsons and Sons, manufacturers of varnishes, japans, enamels, and fine colours, 8, Endell Street, Long Acre, London, W.C. The subject is approached from the historical standpoint, a bright and brief account of Long Acre one hundred years ago being accompanied by a series of very quaint little sketches of notable old buildings in the district, such at Hatchett's, Old Slaughter's Coffee-house, Old Drury Lane and Old Covent Garden Theatres, an unnamed but exceedingly picturesque Georgian tavern; and there are, besides, a sedan chair, a "Cupid after Stothard," etc. In this resort of artists the firm of Thos. Parsons and Sons sprang up as a natural product when George the Third was King. In those days, "few realised how much the studio in a narrow alley of Long Acre would influence the art of to-day: for there was the germ which was to develop later, after many vicissitudes, into the present Royal Academy, under the guidance of Chambers, Moser, Paul Sandby, and others." The firm, therefore, has flourished in an atmosphere of art, and has inherited stimulating traditions. The rest of the book consists of illustrations, many of them in colours, of various schemes and details of decoration. Many periods are represented, as well as most forms of decoration, even including the lettering and ornamentation of signboards, of which there are several handsome examples. The book is undoubtedly rich in suggestion, both as to its well-designed original schemes, which adhere very faithfully to the best traditions, and as to its well-chosen selection of examples of the work of the best periods. The architect as well as the decorator will be glad to possess it, because it gives, in handy and portable form, precisely the guidance of which they are often in need.

Penberthy Automatic Injectors.

Messrs. W. H. Willcox and Co., Ltd., of Southwark Street, London, S.E., have issued an illustrated list dealing fully with their Penberthy Automatic injector, which is for low, medium, and high pressures up to 200lb., and with their Auto-Positive injector, which is supplied for working on high steam pressures and for handling hot water. The Penberthy delivers water into a boiler at 160 degrees to 212 degrees Fahr., and is a "perfect restarting automatic machine"—that is to say, if the current of water be suddenly broken from any cause, such as a sudden jolt, as in the case of a traction engine or road roller, the injector will pick up the water and again establish the current to the boiler automatically, without the manipulation of a single valve or the least attention from an attendant. The Auto-Positive injector covers a wide range of service, but is specially suitable for compound road locomotives, steam road rollers, motor tractors, motor waggons and lorries, etc.

A New Stone Saw.

A recent development of the stone saw frame has been invented and put on the market by its inventor and patentee, Mr. Charles Landale, of Stores Road, Derby. It will cheapen the conversion of natural stone for building purposes; and now that there are so many cheap substitutes, it is more necessary than ever that quarry owners and builders should be possessed of up-to-date plant for quickly and economically converting stone to the required form. A number of users of saw frames, and representatives of the technical press, were present at an official trial of the machine, at Mr. George Graham's quarries, Crosland Moor, Huddersfield, when it was clearly demonstrated that a very considerable advance had been made. It was claimed, indeed, that the cost of sawing stone had been halved. In designing the machine the inventor's objective was to eliminate the defects of the existing type, more particularly the short stroke and quick revolution, with all its attendant vibration, and to substitute continuous cutting for intermittent. This he does in a very simple and ingenious manner, hanging the reciprocating frame by means of a parallel motion properly proportioned to guide the points of suspension in a curved path. By means of this arrangement the cutting blades are so guided as to keep the portion of blade which is in contact with the stone in a position tangential to a curve of large radius, this having the effect of raising each end alternately to allow abrading material to get below the blades. Stated shortly, this means obtaining a motion very similar to that of the hand sawyer. The trial consisted in cutting two blocks placed side by side on the machine, each with three blades—six blades in all. As the slabs to be cut were for an urgent order for stair landings, some of the hardest stone in the quarry had been selected. The cutting speed varied from 7½ins. to 7⅞ins. per hour, the average speed for the whole block being 7¾ins. per hour. To those unfamiliar with the conversion of Crosland Moor stone, this will convey little; but it may be said that had these same blocks been put on a screw-feed frame of recent design, having out-hung radius rods, the maximum speed of cutting would not have exceeded 3½ins. per hour. Such a frame as this was working during the trial on a much shorter block, and though using only two blades, at no time did the cutting speed exceed 4ins. per hour. When it is realised that the new frame takes no more power to drive than the old type, it is evident that a very considerable improvement has been obtained. In the opinion of those present, the cut faces left nothing to be desired. The most noticeable feature of the test, however, was the remarkable absence of shock and vibration.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have this week been sent to the following:—

NOW READY !

THE NEW EDITION OF

SPECIFICATION

(No. 12, 1909-10.)

Price 3/6 Net.

BY POST, 4/-.

A well-known Architect writes :—

This splendid work is a revelation of what can be done in bringing a mass of up-to-date information together. The book contains just those bits of information one wants to find out quickly at various times, and what may or may not be found after hunting through many text books. The matter is thoroughly practical.

(*Signed*) ALLEN T. HUSSELL, F.R.I.B.A.

Special Points about the New Edition:

1. It has been very drastically revised and brought up-to-date in conformity with the opinions and suggestions of many well-known Architects and other professional men.

2. A general Index of Special Articles on Planning and Equipment which have appeared in previous issues is included.

3. The information has been rigidly condensed in order to reduce the bulk of the volume, and to make it easier for reference.

List of Sections.

The information in each section is contributed by a Specialist.

Division I.—Building Construction.

1. General Conditions.
2. Excavator.
3. Drainlayer.
4. Concretor.
5. Bricklayer.
6. Mason.
7. Terra Cotta & Faience Worker.
8. Structural Engineer.
9. Fireproof Constructor.
10. Pavior.
11. Carpenter.
12. Joiner.
13. Ironmonger.
14. Roofer.
15. Ventilating Engineer.
16. Heating Engineer.
17. Founder.
18. Smith.
19. Plumber.
20. Bellhanger.
21. Mechanical Engineer.
31. Art Metal Worker.
22. Electrical Engineer.
23. Marble Mason and Mosaic Worker.
24. Plasterer.
25. Glazier.
26. Painter and Decorator.
27. Paper Hanger.
28. Horticultural and Landscape Architecture.
29. Blind Maker.
30. Furnisher.

Division II.—Municipal Engineering.

32. Roads.
33. Sewerage.
34. Water Supply.

Supplied by all Newsagents or direct from the Publishers.

THE ARCHITECTURAL REVIEW,

Edited by MERVYN E. MACARTNEY, B.A., F.S.A., F.R.I.B.A.

This high-class Review is finely illustrated, and includes among its regular features "The Practical Exemplar of Architecture," with Views and Measured Drawings.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, *Caxton House, Westminster.*

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Bristol.—Recommended for acceptance for strengthening the structure, and for renovating and re-adapting the premises of the Castle School for use as an elementary school, for the Town Council:—

R. F. Ridd and Sons, £2,445.

Compton, Leek.—Remodelling premises, Compton, Leek, for the Leek and Moorlands Co-operative Society, Ltd. Reginald T. Longden, architect, Burslem and Leek. Accepted tenders:—

General alterations, J. Heath and Sons; painting, plumbing, etc., R. Nadin; electric lighting, John Richards; electric hoist, etc., Chas. Leek; all of Leek.

London.—For erection of school at St. Mark's Road, Kensington, for the London County Council.

	£	s.	d.
F. and H. F. Higgs, Herne Hill	£11,840	0	0
S. N. Soole and Son, Dunstable Works, Richmond	10,762	9	5

How far ahead you get in your work—and How much money you make—Depends entirely upon you!

The opportunities in every modern line of business—of commercial, technical and scientific endeavour of all kinds are really unlimited.

It is the men with the necessary training who are not available.

Any manufacturer—or proprietor of any thriving business forced to meet competition every hour—will tell you that the finding of men with a thorough understanding of specialised lines of work is his greatest problem.

We have letters from business houses as proof. Similarly, we have thousands of letters from ambitious men and women who, having completed specialised courses of study in the I.C.S. have been eagerly snapped up by just this sort of employer. Better positions—higher pay—that, in a nutshell, is the result of an I.C.S. training. It is the thorough, practical, step-by-step grounding in every department of a given line which makes the I.C.S. training the only one of its sort in existence.

No classes to attend—no books or apparatus to buy—not a lesson missed—no interference with your work or your pleasure—and the Students' Aid Department at the back of you when you have completed your course.

Let us send you free of any obligation, **facts** which will open your eyes.

Simply write on a postcard what line interests you most, and post it to the International Correspondence Schools, Ltd., Dept. **156 B.** Kingsway, W.C. Your choice of over **120** courses.

The Apprenticeship Question.

A conference on the apprenticeship question is to be held at the Mansion House, London, on December 3rd, under the presidency of the Lord Mayor. The conference has been convened by the London County Council, who, in the desire to make it fully representative, have invited to take part in it not only a number of leading experts, but also representatives of the Board of Trade, the Board of Education, the Charity Commission, the City Corporation, the City Parochial Foundation, the Chamber of Commerce, Borough Councils, apprenticeship charities, and unions of workmen and employers. The conference will have enough to consider. It is to discuss "the development of trade schools and industrial training, and in connection therewith (1) the administration of the apprenticeship charities of London; (2) the establishment or development of employment bureaux, or other means of bringing those leaving school into touch with the industrial and commercial world." There will therefore be either a very long sitting or a very superficial discussion, from which but little result can be anticipated beyond the possible appointment of a representative body to consider the subject with greater thoroughness and deliberation. The Lord Mayor is keenly interested in the subject, upon which he has already spoken in public, at a meeting of the Worshipful Company of Founders. He said that when he had urged upon employers the question of apprenticeship, some of them had pointed out that the living-in system could not be again revived, the conditions of trade having so greatly altered as to render impossible the old relationship between master and apprentice. The Lord Mayor thought that it would not be impossible to get an Act of Parliament compelling boys when leaving school to learn a trade. This proposition looks rather drastic; but, at the same time, it suggests the reflection that there is no reason why some of the compulsion that is so abundantly imposed on employers should not occasionally be directed towards the workers. Sir William Grantham, in homely and familiar phrase, hit the mark when he said that one of the great hindrances to apprenticeship was the desire of fond mothers "to see their sons put on a black coat." This is doubtless a prolific cause of the enormous surplusage of unskilled labour; and it must have a tendency to withhold from the ranks of skilled labour some of the brightest and most intelligent lads. This is an important point, because, while it must be sadly admitted that at the present time there is a superabundance of skilled labour of a sort, it is no less evident that workmen of really first-rate ability are exceedingly scarce; and the responsibility for this state of things is too confidently attributed to employers. As someone has very aptly said, "The best encouragement to employers to train more boys is to provide boys whom it is worth training." Owing to some defect either in our educational system or, as Sir William Grantham suggested, in our social outlook, this provision is by no means adequate. How to make it so is the problem that the conference has to consider; and builders, to whom the matter is of pressing importance, will no doubt have a powerful influence in shaping the course of a movement that, being so general—it seems to have come to a head spontaneously all over this country and France—encourages the hope that it may prove effectual. In the meantime, the account given on another page of the operations of the Apprenticeship Board, instituted some years ago by the Plumbers' Company, will be read with keen interest.

Our New Edition de Luxe.

The "Builder's Journal" Edition de Luxe, to be published on Friday, December 31st, 1909, price 1s. nett, will comprise about 300 pages, printed on art paper, and copiously and finely illustrated. Current British architecture will be illustrated with examples of recent work by leading architects of to-day; the general building events of the year will be usefully summarised; and an account will be given of what has been done during the year in the rapidly expanding domain of reinforced concrete construction. The chief feature of interest, however, will be the highly important section on Modern American Architecture. Only in this journal and in the "Architectural Review," which is issued from the same offices, has anything like an adequate account been attempted of the very remarkable development of architecture in the United States. The representative examples that we have illustrated have revealed in the most convincing way that American art and American construction are well worthy of the most earnest attention. We have been assured on all hands that the opportunities for studying it that we have been able to afford have been warmly appreciated, and many influential British architects have requested us to amplify the information already given. Accordingly, we have collected, in the extra number of the Journal, dated December 31st, 1909, the most complete account of American architecture that has yet appeared in this country. It is illustrated with about 150 examples of the most noteworthy work that has been done in the United States, and in the letterpress the evolution of American architecture is traced from the present time to its rise when America became a nation. As this extremely interesting account of the architecture of America, and of the men who have made it, is sure to be in great demand, readers are advised to make early application for the 1909 Edition de Luxe of the "Builders' Journal" containing it, similar issues having been immediately exhausted.

Mr. Balfour on Beauty.

Mr. Arthur Balfour's Romanes lecture, delivered last Friday in the Sheldonian Theatre at Oxford University, and fully reported in the "Times" of the following day, had for its title "Questionings on Criticism and Beauty." The title was only too apt, for the so-called "lecture" was unwritten, and was really a rather formless chat, which raised more questions than it settled; and it must have left his hearers in a more profound state of obfuscation than that in which it found them. For great indeed is the mystery of æsthetics; and neither by natural bent nor by training is Mr. Balfour inclined to clear and positive statement on any subject that will admit of "philosophic doubt." His re-statement of certain modern views, however, was sufficiently clear and definite, as when he remarked that "they would not find any competent modern critic, in a serious consideration of a picture, a poem, a statue, or a symphony, asking what end, outside the production of a beautiful work of art, it subserved. They would find him asking whether it was a beautiful work of art, and that was the only question with which, primarily, he was concerned." Then came one of his very searching questions: "If the feeling of beauty was the real point, whose feelings were they to take into account?" If he can be said to have attempted any kind of answer to this crucial question, it must be admitted that he did it in a characteristically cautious and non-committal way. "Always," he said, "there was a real hostility of feeling between the ideals of the new generation and those ideals which were the glory and the triumph of their immediate predecessors. If they went into any great Gothic building, due to the labour and the public spirit of successive generations, they would find every style mixed and combined. We admired the rather mixed result; but did our eclecticism represent the feelings of the architects and builders? He was convinced that nothing but considerations of time and money, overwhelming considerations in the Middle Ages as they are now, prevented the old work from being pulled down, and the whole fabric being built up according to the ideas of the architect of the day. He believed that an architect who lived during the time of the Middle Pointed or Later Decorated would as soon have built in an earlier school of Gothic work, as a self-respecting woman of the present day would consent to appear in the crinoline which was the universal female attire when he was a young man." Whence he deduced, somewhat obscurely, that "there really was no uniformity of standard to be got at by consulting the men of trained sensibility, especially if those men happened to belong to different ages and generations." This strikes one as being but little better than a laboured and turgid way of saying that fashions change; and the observation concerning the impatience of a new school with the works of an old would seem to have been prompted by a recent newspaper discussion on the casing of the columns of Canterbury Cathedral. It was a most enjoyable chat, very well worth reading as reported, since it represents what cultured people are thinking on subjects with which they are not very intimately acquainted; and their point of view is not without its value, because, after all, their views and notions on art react very strongly on the artist. We wish, however, that Mr. Balfour could have found time to write out his lecture; in which case it might not have been more luminous, but certainly would have been less loosely expressed than, for instance, in the passage about architecture, in which period and style are somewhat confused.

Contract Conditions. The "Form of Tender and General Conditions Relating to the Erection and Completion of Annexe and Sundry Alterations and Additions to Existing Buildings" for the Salford Town Hall, is a formidable document. It comprises nineteen foolscap pages of printed matter, and on almost every page there are items to which builders may reasonably object. The objections begin with the first effective clause, which happens to be clause 2, because clause 1 is occupied with the usual rigmarole of interpretation of such recondite terms as corporation, architect, and contractor. Clause 2, it is thought by the objectors, may be so construed that the contractor would find himself unable to charge for work that might happen to be omitted from the bill of quantities. This is possibly a strained construction; but, in view of some extremely arbitrary clauses that follow, builders may be well excused for apprehending the worst. Clause 3, for instance, provides that "Should any discrepancies appear between the bill of quantities and specification and the drawings, or should any misunderstanding arise as to the meaning or import thereof, or as to which of them should be followed, or about the quality or dimensions of the materials, or the due and proper execution of the works, or as to the measurement or quality and valuation of the works executed under the contract, or as extras thereupon, deductions therefrom, or as to any other matter or thing whatsoever arising out of the contract, or as extras thereupon, the same shall be explained and decided by the architect, and his explanation and decision shall be final and binding upon the contractor, and the contractor is to execute the work according to such explanation and decision, and without charge or deduction to or from the contract." Here, it is true, the contractor gets a sporting chance of doing less work than he might reckon on in preparing his tender; but on which side the probabilities lie it would be quite superfluous to say. The most objectionable feature of this clause, however, is that it makes the architect the final arbitrator, thus placing him in the invidious position of a contractual referee. Clause 4 goes a step farther in the same direction. It is so rich an example of audacity that we cannot forbear quoting it in full: "In the event of anything evidently necessary to the due and complete performance of the works (of which necessity the architect shall be the sole judge) being omitted to be shown in the drawings, or being omitted to be described in the bill of quantities and specification, through oversight or error or otherwise, the contractor is, notwithstanding, to execute in the most perfect and complete manner all such works as if they had been severally shown and described, without any extra claim or charge, according to the direction of the architect, and to his satisfaction." For frigid and calculated one-sidedness, that would be very hard to beat. The contractor who tamely assented to it would be justly credited with rather less business acumen than the original Simple Simon. Clause 14 is to much the same effect. Clause 5 throws upon the contractor the responsibility of making claims for extras before the work is done; otherwise, he can make no claim at all. Clause 9 generously holds the contractor responsible for the accuracy of the drawings and for the consequences of possible errors. The same lavishness of generosity is shown in kindly allowing the contractor to be responsible for any injury that may occur to Corporation employees during the carrying out of the contract. He is also, it would appear from clause 19, to be graciously permitted to lay on and supply at his own cost all the water required on the works, and he is to be held responsible for twelve months after the works are completed for damage to gas-pipes, water-pipes, electric cables, etc. The contractor is to guarantee the Corporation against all accidents, damages, claims, and losses of every description, although it seems that the quantities contain no provision for insurance—not even against fire. He is to be held responsible for delays caused by sub-contractors or manufacturers; and "all specialists, merchants, tradesmen, or others executing any work, or supplying any goods for which prime costs prices or provisional sums are included in the bill of quantities and specification, who may at any time be nominated, selected, or approved by the Corporation, are hereby declared to be sub-contractors employed by the contractor." The period of maintenance after the issue of the certificate of completion is to be twelve months. The architect shall have power to suspend the works "at this absolute discretion, and for any cause whatsoever," but the contractor shall not be entitled to any compensation for the delay; and the Corporation reserve to themselves the right to abandon at any time the whole or any part of the works without compensation to the contractor in respect of the abandoned works. This list by no means exhausts the beauties of the conditions, but we do not propose to go on with the dreary catalogue. Nor does it seem, for the moment, to be either necessary or desirable to comment severely on the points cited. They speak for themselves; and as we understand that the Corporation is to be approached with the object of getting them modified, we refrain from making remarks that might possibly embitter the negotiations. Nevertheless, we wish to make it quite clear that the day has gone by when contractors would meekly submit without a struggle to any conditions that a Corporation might see fit to impose. One of the objects for which builders have become federated is sturdy and effectual resistance to unfair treatment in the matter of contracts, and surely there can be but little doubt that, in the present instance, a firm, united, and temperate protest must prove successful. If there is any force in right and reason, a simple and lucid statement of the case should be sufficient to secure amelioration, and we shall be delighted to be able to report that the Corporation of Salford shall have been induced to act towards contractors in the true spirit of its excellent motto: "Integrity and Industry." In particular, we lay strong stress on the advisability—or, as we should prefer to put it, the just necessity—of adding an arbitration clause providing for the appointment of an independent referee in case of dispute; and we confidently assume that most architects are always very glad to obtain thus much relief from the onerous responsibility of exercising arbitrary powers.

Design in Reinforced Concrete. The lecture by Mr. Richard L. Humphrey, at the Concrete Institute meeting, was particularly instructive, both as regards its matter and the illustrations in the form of lantern slides. By means of the latter, Mr. Humphrey was enabled to show a number of views of buildings in concrete and reinforced concrete, designed by American architects, and to give some idea of the trend of architectural design in what the lecturer termed this "plastic" material. Judging from the views of farm buildings, houses, etc., shown on the screen, our American confreres have not, as yet, made very much progress in the matter of reinforced concrete design, although they are less hampered in the use of the new form of construction than are the architects in England. Indeed, Mr. Humphrey admitted, in the course of his explanatory statements on these slides, that the initial efforts of the architects had not been very satisfactory; but he took the opportunity of pointing out one or two of the buildings shown as well designed. With due deference to so eminent an engineer, we take leave to say that not one of the buildings shown could be regarded as really expressive of the material. A skyscraper store, and a fine country mansion in the Renaissance style, shown by Mr. Humphrey, might, so far as appearance goes, have been built in stone; and as regards the latter example, every care seemed to have been taken to copy the effect of stone columns and coursed ashlar work. The engineering designs were by far the most satisfactory of all those shown, chiefly because no attempt had been made to imitate any other material, and the essential problem of the design had been met in the simplest and most effective manner. One of the most interesting statements made by Mr. Humphrey concerned the polishing of concrete. He confessed that he had not thought it possible; but during his recent visit to Austria he had seen concrete polished, with a surface as fine as that obtained on marble.

Architects of the Day.

VIII.—Jean-Louis Pascal, Membre de l'Institut de France.

It is an essential characteristic of every leader of men to possess a personality which inspires and retains the confidence of those who come under his influence. Such personality expressing as it does a peculiar combination of the best elements of character, added to the ordinary skilful performance of his duties, is often all that is necessary to a considerable measure of success in many an undertaking; but to attain great success and retain it over a period of many years in certain professions, especially in such as teaching art—of which the most important part is the indefinable—requires not only confidence in the man and his opinions, but that he shall possess that rare charm which wins devotion and gains the affection of his followers. Especially is this true when that leadership in his profession is recognised not only by virtue of his accomplished works but by what is practically a kind of ballot—by the number and successes of those men who seek and profit by his instruction—his pupils —or who desire his judgment upon their works, who elect him judge or juror to decide between them in competitions and for honours at the exhibitions; and it is in this way that leadership among architects is recognised by our confrères in France. That Monsieur Pascal is, and has been for many years, recognised among the ablest architects of to-day, not only in his own country, but wherever architecture is understood or practised, is too widely known to require our statement of the fact; but the important incidents and details of his long, valuable, and brilliant career, which are less known than they should be, can hardly fail to be of interest to those many British architects who have become acquainted with only his name or his more important works.

The subject of this sketch, Jean-Louis Pascal, was born in Paris the fourth of June, 1837, and at about the age of sixteen years became a pupil of Gilbert, and entered the Ecole des Beaux-Arts a year later. He almost immediately distinguished himself as an artist by winning the second and, the following year, the first *prix Rougeoin*—the latter design, still being regarded as one of the most brilliant decorative essays the prize has drawn forth. He gained the *prix* Abel Blouet, and many other student honours, including the *Grande médaille d'émulation* and a *Prix Départmental*, and at the age of twenty-two years won for the first time (1859) the second *Grand Prix de Rome.* This was the year that Boittee gained the *premier prix*, and the first of a series of competitions for this coveted prize, when the *logists* (the competitors) chosen for the final struggle after the series of examinations, which reduce the number of aspirants from several hundreds to ten; these make their final drawings in a *loge*—small room—at the *Ecole*, and are thenceforward known as *logists*, which is a considerable student honour), when the *logists*, for a period of eight or nine years, were all artists of more than the ordinary calibre of these *concurrents*, nearly all having subsequently gained the *Grand Prix* and eminence in his profession. The list of "*Grand Prix*" includes Boitte 1859, Moyaux 1861, Chabrol 1862, Guadet 1864, Pascal 1866, and Bénard 1867. Among these, Pascal became prominent for several reasons; he gained a *loge* seven times, and second *Grand Prix* twice (a unique distinction), and finally the *Grand Prix* itself, with the most remarkable artistic composition that has yet been produced in all the great competitions for this prize.

In all previous competitions the condition of site had been such as to allow a simple symmetrical plan, and absolute symmetry had been a *sine qua non.* It was upon designs for absolute impossible buildings for France of that time, or even for the United States at the present, that the great abilities of Garnier, Ginain, Bonnet, Vaudremer, Moyaux and Guadet, had been made apparent. Each had produced a brilliant classical composition, and it seemed as though the last word in such design had been given in Moyaux' masterly plan for an "Etablissment de Bains dans une ville d'eaux thermales," which won the *grande timbale* in '61. But the programme of the year 1866, gave an irregular site with conditions such as are met in actual practise, and for which the classical monuments of neither Greece nor Rome afford much inspiration. The building, too, was within the bounds of possibility, not to say probability. The solution demanded above all things invention, and put it to the *logists* to prove that they could produce a modern group of buildings fit to rank with the great classical works. The result produced an entirely new type of design, in which almost every difficulty met with in complicated planning is found handled with a mastery rarely achieved save in the later works of those architects of bygone days, who we call the "great masters." To realise its greatness one needs compare it with the plans by Batigny and Bénard (the winner of the University of California competition), which were placed second and third respectively, and either of which seen by itself is a wonderful piece of work, but is quite outclassed by this extraordinary design by Pascal.

One can with difficulty give an idea of the labour and energy which must be deployed to gain a *loge* seven times, and triumph over the numerous competitors who present themselves for these examinations. The diversity of the programmes requires an uncommon subtlety of talent, and innumerable resources of imagination. The Grand Prix de Rome is, as everyone knows, the highest "recompense" awarded to architects, as it is also to painters, sculptors, engravers, and musicians—by the French Government.

The same year he obtained at the Salon of 1866 a medal for a study for a Legislative Building in Holland. During the five previous years he had worked as the trusted and intelligent collaborator of Charles Garnier upon the design for the Grand Opera, and his name is inseparable from that of the great designer of the *Academie Nationale de Musique*. One sees in his *Grand-Prix* design that he knew how to bring forward in his student work the knowledge gained in practical experience. And the fact of con-

Photo. Eugene Pirou

MR. JEAN-LOUIS PASCAL, MEMBRE DE L'INSTITUT DE FRANCE, OF PARIS.

tinuing to enter the competitions at the Ecole after commencing upon actual architecture is enough to prove an extraordinary capacity for work; but this is further demonstrated by the beautiful sets of drawings of restorations of antique monuments which he sent back to Paris every year during his stay in Italy and Greece, which obtained the highest commendations of the *Academie des Beaux-Arts*. At Rome he designed the monument erected there, in the French Church of St. Louis, in memory of Colonel d'Argy.

After the war he became Auditor to the "Conseil Général des Bâtiments Civils," and was then chosen by the celebrated architect, Lefuel, to become Inspector of Works upon the completion of the Louvre, where he remained thus occupied for several years.

In 1872 he designed the exquisite monument to Henri Règnault, in collaboration with Coquart, Chapu, and Degeorges (sculptors), which stands under the arcade in the Cour de Murier of the Ecole des Beaux-Arts. The same year he submitted a design, which was premiated in competition for the Hotel de Ville, Paris, and the following year won a medal at the Vienna Exposition. He also received the Lheureux prize, given by the City of Paris.

In 1874 he entered a design which was awarded a prize in the competition for the Church of the Sacré-Cœur, at Montmartre, and succeeded his former master, Questel, as Chief of the Atelier, now known by his name, but which is in full: *Atelier Blouet-Gilbert-Questel-Pascal*. He was made the successor of Henri Labrouste as architect of the National Library (Paris) in 1875, and also Diocesan Architect of the Drôme. In his work upon the new wing of the library he proved himself worthy to succeed Labrouste, especially in his reconstruction of the façade in the Rue Colbert, than which there is no work in modern Paris more charmingly designed or more delicately detailed.

He won in competition in 1876 the *Faculté mixte de Médicine et de Pharmacie* at Bordeaux, an important work which occupied most of his time during the next two years.

At the Universal Exposition of 1878 he designed the Portuguese National and Colonial Palace, which scored him another success—a medal of the first class and the decoration of the Cross of Portugal.

The same year he was made a member of the Jury of the Ecole des Beaux-Arts, and in 1880 received the decoration of the Cross of Chevalier of the Légion d'honneur.

If now we mention the Monument to Michelet in the cemetery of Père-Lachaise, designed in collaboration with Mercié (sculptor), the monuments to President Carnot at Bordeaux, and of Victor Hugo, in collaboration with the sculptor Barrias, and of Charles Garnier at Paris, and the decoration of the *Chapelle de la Rochelle*, in collaboration with Bouguereau (painter), we shall have mentioned the most of his purely artistic work; always dearest to the heart of the French architect.

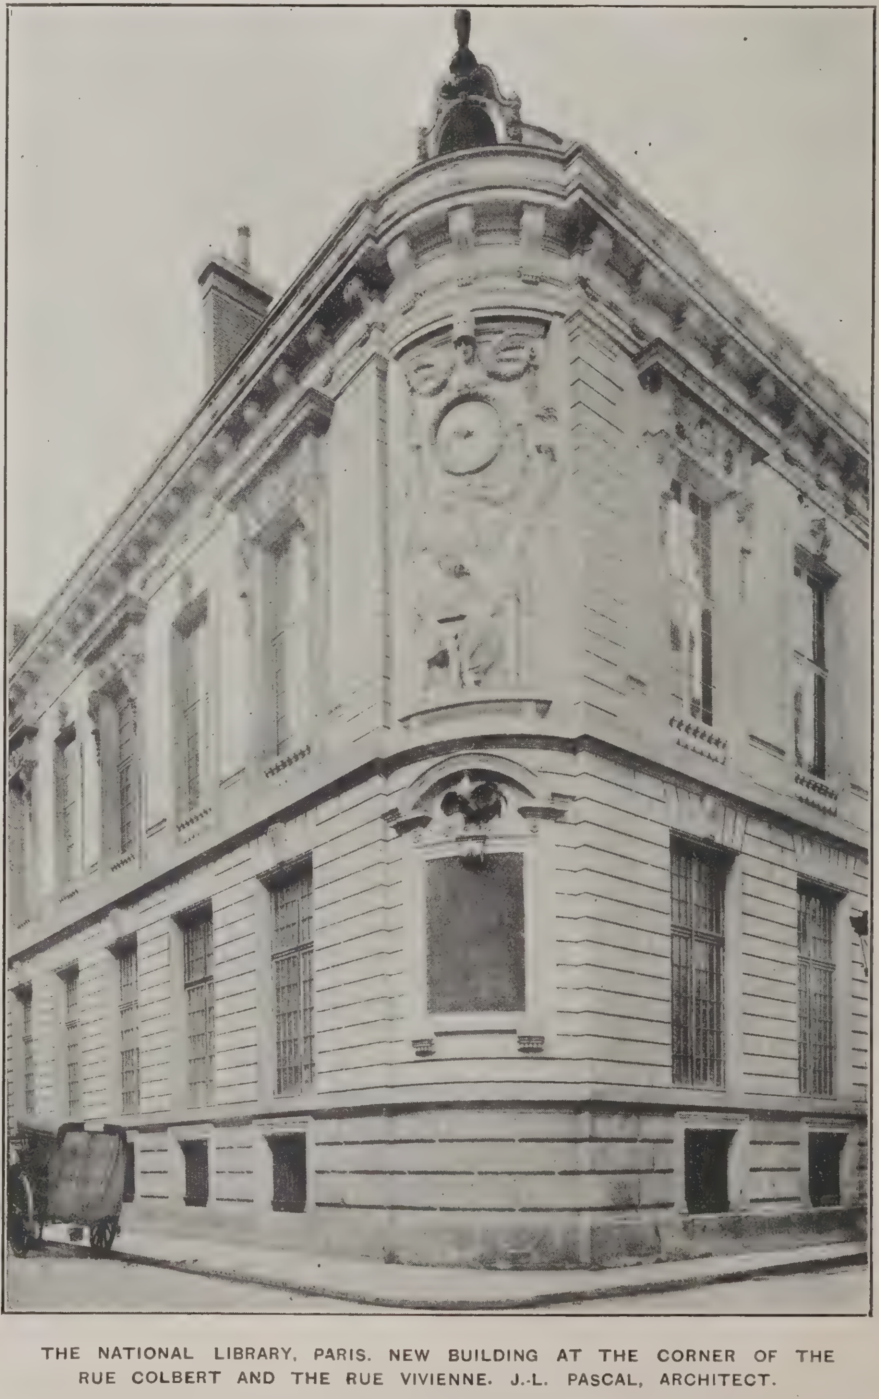
But there is a long list of work of greater magnitude and, aside from the artist's point of view, of greater interest—which has made up the bulk of the life's work of Mr. Pascal. Among these we may place in the first rank the *Mairie* and a group of schools at Ablon, the transformation of the old Italian theatre into a branch of the Banque de France. The town house of the painter Bouguereau at 75, rue Notre Dame-des-Champs, which was one of his earliest works, the house of the engraver Jacquet at the Isle-Adam, that of M. Renouard at Pau, the Château and dépendances de Doux near d'Aurillac the town house of the painter Perrault at 45, Boulevard Flandrin, the transformation of a part of the Palais Royal into a town house for M. Blanchet. Also the beautiful apartment house at 197, Boulevard Saint-Germain, and the Kœnigswarter house at 12, rue de Prony. One of his more recent works, the Château de Maubuisson at Clairfontaine, near Rambouillet, is shown by the illustrations. An indefatigable worker, he is at present busy—at the age of seventy-two years!—with the construction of the Faculté de Pharmacie, which is being added to the Faculté de Médecine at Bordeaux, constructed by him in 1876.

This incomplete list includes many of the best specimens of architecture of our epoch, but as many of them are known to everyone, it will not be necessary to dwell upon them here. Besides this private practise and the public offices filled and mentioned above, he has performed important functions as architect of the diocese of Valence, of Avignon, and the Vancluse. In 1880 he became a member of the National Conseil Général des Batiments, of which he is at the present time Inspector-general and Vice-president.

In 1887 he was made a member of the Academy, in 1889 promoted Officer of the Légion d'honneur and also chosen a member and reporter of the Jury of the Section of Architecture of the Universal Exposition, following which he was created an Officer of Public Instruction. In May, 1890, he was elected a Membre de l'Institut (Académie des Beaux-Arts), in succession to Jules André, and in 1903 Commander of the Legion d'Honneur. He has served as member of the jury of innumerable competitions, salons, and exhibitions, with which his lucid, concise statements, coupled with his unfailing perception and judgment, have borne great weight. As Inspector-general of Civil buildings (4th division), Mr. Pascal is entrusted with the supervision and care of the following public monuments:—The Observatory, the Grand Opera, the Pantheon, and the Grand Palais de Champs-Elysées at Paris; the *Chateau de Pau*, the *faculté de medicine et de pharmacie* at Montpelier; the *Ecole veterinaire* at Toulouse, and the Institution of Deaf Mutes at Bordeaux.

His sense of the refined and delicate in art is as extraordinary as his great *finesse* in the knowledge of it. Pascal belongs to the great race of architects, whose works reflect the joyous and glorious side of the world's history—it is thoughtful, pleasing—in a word, *refined*; and all good architecture is autobiography!

The life-story of every French architect, at least of those trained at the National



THE NATIONAL LIBRARY, PARIS. NEW BUILDING AT THE CORNER OF THE RUE COLBERT AND THE RUE VIVIENNE. J.-L. PASCAL, ARCHITECT.

School of fine arts, begins with his master's teacher and terminates—probably?—with his youngest pupil's last pupil; but for the purposes of this article it will be sufficient to mention only that Mr. Pascal was a pupil of Gilbert, and after the death of Gilbert of Questel, who succeeded him, and that he presides over the atelier in which he studied forty-three years and more ago; and among his pupils a few of the more distinguished are Henri Paul Nénot, architect of the Sorbonne, Grand Prix de Rome, 1877; John J. Burnet, of Glasgow, architect of the extensions to the British Museum, Désiré Despradelles, twice classed first for the *Grand Prix*, and twice the victim of adverse circumstances, winner of first, *second Prix de Rome*, and of third place in the competition for the University of California, architect of the Boston General Hospital, and Professor of Architecture in the Massachusetts Institute of Technology; Charles Mewès and Arthur Davis (whose work was reviewed in the first article of this series), architects of the Ritz Hotel, "Morning Post" building, and the Automobile Club, London; Frank Simon, of Liverpool, joint architect of the Liverpool Cotton Exchange; Professor Paul Cret, University of Pennsylvania; Cassièn-Bernard, Courtois-Suffit, Recoura, Duquesne, and Debat.

As to the record of his atelier, during the past seventeen years there have been but four when one of his pupils did not gain either the *Grand Prix* or one of the two second *Prix de Rome*, as will be seen by the following list of pupils, gaining one of these prizes and the prize achieved:—1893, second, Second Prix, Alfred Recoura; 1894, *Grand Prix*, Alfred Recoura; 1895, first Second Prix, Edouard Duquesne; 1896, *Grand Prix*, Louis Pille; 1897, *Grand Prix*, Edouard Duquesne; 1898, second Second Prix, Auburtin; 1899, ——, 1900, first Second Prix, J. Bernard; 1901, second Second Prix, Barrias; 1902, first Second Prix, Eugene Coutan; 1903, second Second Prix, Joulie; 1904, first Second Prix, Henri Tauzin; 1905, 1906, ——; 1907, second Second Prix, Charles Boussois; 1908, *Grand Prix*, Charles Boussois.

Among his earlier pupils gaining one or another of the *Prix de Rome* are Breasson 1875, Cassien-Bernard 1876, Nenot 1877, Courtois-Suffit 1882, Quatesons 1883, Heubes 1877, Despradelles 1889, and Bossis 1890. The *Prix Achille Leclere* has been won by his pupils eight times since 1895, and of the *Prix Chenavard*, nine since that year.

His pupils have come from all parts of the world, but especially from England and the United States, one great advantage to his English-speaking pupils being that he not infrequently gives them the benefit of his kindly criticism in their own tongue, which he speaks fluently. To all he is affectionately known as *Père Pascal*—in fact, to many of the students who have never been his pupils! As a striking testimony of this spirit of affectionate loyalty and friendship his former pupils memorialised the twenty-fifth anniversary of his adoption by the atelier—for it must be remembered that the atelier chooses its own master—by having a medal struck in his honour and presented to him. Chaplain, the greatest of engravers of medals made the design, and in it this sympathetic artist quickly caught the sentiment of the pupils; on the obverse it bears a profile portrait of M. Pascal; on the reverse there is a strong luxuriant tree under the protecting boughs of which are springing up young shoots, which are beginning to put forth foliage.

To-day, he still attends scrupulously to business, and the interests of his students—of which he always has from fifty to one hundred—a large task for even a man in his prime, and is as active and alert mentally as in the days when he worked for the *Grand Prix*, and assisted Garnier on the Opéra, and still found time to make more than a slight reputation as a writer of magazine articles, and to become a mathematician of conspicuous ability. He is an entertaining and delightful conversationalist, and a charming and witty after-dinner speaker.

Something of the force of his logic and clarity of expression may be gleaned from the following letter written about ten years ago to a young American architect (the italics are our own):—

"*The time has passed when contemporary civilisations ignore even their nearest neighbours.* There are no materials, no inventions, no new processes of one country that are not immediately known over all the world and employed everywhere. These two factors of the renaissance in art prevent us all, you as well as us, from creating significant forms, or a so-called new style, which will not be a growth, a development; one epoch simply in the upward and continuous evolution of architecture. *More and more will architecture become universal—there will be little beside the conditions of climate and material which will make diversity*—unless there becomes a religious evolution, and that is hardly to be looked for in this century of tolerance.

"It is necessary to glance at your side. Having at the first step reached the culminating point of all civilisation, *having had no childhood apart from ours, your composite country can offer no solutions, which are not the consequences of our past conquests, which are yours now, as well as ours.*

"Certain problems, whose different terms open the possibility of new discoveries, might furnish starting-points for interesting combinations; but just as your discoveries in science, in literature, in military, and in all the branches of human attainment tend more and more to make uniform the march of progress, just as the easy communication suppresses more and more the local characteristics which constitute the physiognomy of all people, and by bringing together gives to them the atmosphere of the provinces, and to the provinces the individuality of cities and villages, *so architecture from day to day will tend more towards uniformity in future solutions.* This consequence, this extension of civilisation, will prove a great blow to artists. It has taken us centuries to lose our native originality, which makes the differences and peculiarities of diverse styles synonymous with differences in beauty; but it has taken us as much time to attain that proficiency, which means to a certain extent the negation of originality, while it is the greatest security to the *art of composition.*

"*Like us, you are now condemned for not giving proof of innocence,* for not cultivating your art, for not refining your tastes, and not cherishing your architecture as much, and more, in the conception of plans, as in the arrangement of façades.

"Having attained your majority at the start, we can only wish reciprocally that each of us may reach old age as late as possible, to uphold each other in the strength of our maturity, for decrepitude and death alone can produce from decay and ruin that renaissance of which all generations have dreamt, and which is the flower of the grave.

"There is no sadness in this thought! The highway is long, and, above all, it is broad, and we may all walk in it—probably in uniform step—at any rate, free and powerful in that vast clearing which replaces the charming footpaths in which our fathers lingered."

At a meeting of the Lord Justice FitzGibbon Memorial Committee in Dublin recently, it was decided that, subject to the approval of the Cathedral authorities, the memorial be a statue in St. Patrick's Cathedral, Dublin.

* * *

By the unfortunate collapse of a house in Cumberland Street, Dublin, two lives were lost. The house, which was let in tenements, had been in a dangerous condition, and Mr. Gately, a contractor, and a labourer named Leonard, were engaged in making the necessary repairs when the back of the house, which was forty feet high, collapsed, and both men were buried in the ruins. There were six families residing in the house, but they reached the street in safety.

AN ARCHITECT'S VIEW OF QUANTITY SURVEYING.

At a meeting of the Quantity Surveyors' Association, held at Caxton Hall on November 10th, Mr. H. T. A. Chidgey (president), in the chair, said: We are to be favoured tonight with a paper to be read by Mr. Wm. Woodward, a very well-known gentleman in the City of London, who has been in practice for a great many years, and who will tell us something on a subject with which he is well qualified to deal. His paper is entitled "Quantities and the Quantity Surveyor, from an architect's point of view." That is a point of view which all quantity surveyors are anxious to know of. We very highly appreciate the architect's point of view. Mr. Woodward will tell us something which will be extremely interesting and of practical value, and I need not waste your time or his by introducing him at longer length to a meeting of quantity surveyors in London. I will ask him at once to be good enough to read his paper.

QUANTITIES AND THE QUANTITY SURVEYOR, FROM AN ARCHITECT'S POINT OF VIEW.

Having in my earlier years had some little experience in taking out quantities, and, in my later years, had the good fortune only to employ quantity surveyors, perhaps the knowledge gained in an active professional life of over 40 years may have resulted in the gathering together of a few thoughts, the delivery of which may lead to a lively discussion which will be of some advantage to architects as well as quantity surveyors.

Why Architects Should Not Supply Their Own Quantities.

As recently as February, 1906, Mr. H. J. Leaning read a paper at the Surveyors' Institution on "The Assimilation of the Practice of Quantity Surveyors," and in that paper he made a statement which I most strongly endorse, viz., that "there are a number of powerful reasons why the architect should not supply quantities for his own works, perhaps the strongest being that it tends to subvert that impartial treatment of the building owner and the contractor which should be the architect's leading principle, and which (as experience shows) is often seriously impaired by his assuming the position of quantity surveyor," and I should like to add to that the strong objection there is to architects employing men in their own offices, at a salary, to take out the quantities for works in hand. I have heard of cases even where architects have allowed these assistants to place their names at the bottom of the endorsement on the bills of quantities, with the obvious intention to convey to outsiders the idea that the quantities were prepared by an independent surveyor. If men make up their minds to indulge in the joint practice of architects and quantity surveyors, they should not be afraid to make the fact clear to clients and to contractors. I understand that in the provinces the custom of architects taking out their own quantities is more prevalent, and is better known to employers and contractors, and perhaps less objection to the system could be urged as regards the provinces than would be the case in London.

Standardisation of Quantities.

One subject in Mr. Leaning's paper opened the door to an important alteration in the method of taking out quantities, and, if followed up, would, I think, have led to the practical extinction of many quantity surveyors, and to the levelling down of the profession generally. The subject referred to was the "Standardization" of bills of quantities. Personally, I can conceive nothing which could be more injurious to the profession—nothing more calculated to lower the educational status of surveyors than any such system. Bills of quantities, as was mentioned at the time, would become simply a series of lithographed "forms" to be filled in by Dick, Tom and Harry, and would at once considerably enlarge the already too large number of men who term themselves quantity surveyors, and at the same time reduce the number of first-class men who have devoted so much time and labour in acquiring a thorough knowledge of their business. I have not heard anything further of this suggested "Standardization," and I feel sure that you will agree with me in the hope that we never shall.

A Position of Trust.

A quantity surveyor occupies a very important position of trust. The architect relies upon him to include in his bills neither more nor less than is proper and fair; the builder relies upon him to do the same thing; and, in the measurement and valuation of variations on the contract, the surveyor must not deviate from the obligations and duty which are cast upon him to see that the client is paying for nothing that he has not got, and that the builder has provided nothing that he has not been paid for. The architect, who knows perhaps very little of what has been taken in the bills, looks to the surveyor to see that every omission has been accounted for, and the builder that every addition has found its place in the final accounts.

Keeping Pace with the Times.

The quantity surveyor's knowledge has to keep pace with the times. The practitioner who vacated this sublunary abode 50 years ago would be astonished if a Chicago "Julia" rung him up and related the alterations and inventions in building construction which are now in vogue—terra-cotta; reinforced concrete, steel framework construction; patent floors; patent partitions; elaborate sanitary plumbing and fittings; and all the paraphernalia attaching to American, French, and English inventive genius which the modern quantity surveyor has to make himself acquainted with in order to prepare a proper bill for the purpose of a modern tender.

Provisional Sums.

In some cases these difficulties are met by the insertion in the bills of large provisional sums for specialists in this, that, or the other trade, and these provisional amounts form, at times, a very large percentage of the contract sum, and the specialist's work a very large proportion of that undertaken by the general contractor. The longer I live, the more I am convinced that the less there is in a job of the sub-contractors and specialists the better it is for the job generally, and for the contractor in particular.

Shortening the Bills.

There is another matter connected with being up-to-date, which I suppose must be, if it is not already being dealt with, and that is the shortening of the bills. Clients now want their buildings erected and fit for occupation in about the same time as used to be expended in making the drawings and writing the specification. In my early days all the drawings were carefully thought out, and inked in; the scale, and full-size details all equally carefully thought out and inked in; the specification written in complete detail and fair-copied, and then the whole handed to the quantity surveyor, who occupied, perhaps, many months in perfecting a document from which nothing was left out. Page after page of labour to groove,; ditto to rebate, etc., etc.; and then ditto, ditto, ditto, but "cross-grain." In the days of 50 or 60 years back machinery in the builders' shops was in its infancy, if not entirely unknown. And not only in the joiners' and carpenters' shops, but in the contractor's stone yard and at the quarries. A large amount of stone is now worked at the quarries, and sent direct to the job ready for setting, and the labours on woodwork have been reduced, as regards cost, by machinery, to such an extent that I should say much of the quantity surveyor's work could be correspondingly reduced without disadvantage from his point of view, or from that of the client and builder. I am quite aware that it is extremely difficult to know where to draw the line in this shortening of work; I have been told, when I have complained of what I considered the inordinate length to which some bills had been carried, that whatever labour or work the builder had to do, that work should be set forth in detail in the quantities. That may be, and is no doubt quite true, but, notwithstanding, I think it is a matter worthy of the attention of the surveyor as to whether or not some substantial shortening of the bills as regards carpenters' and joiners' labours might not with advantage to all concerned be effected. I know that as regards labors on Masonry many surveyors do not now take them off, but they do what to my mind is quite as good from the estimator's point of view, and that is to split up well in the bills the various classes of stonework, and attach sketches showing the labors on these various classes of work. It is said on the other hand that the taking off of all labors is essential to enable the estimator accurately to judge of the value of the foot cube, and no doubt I shall hear, tonight, the opinions on the two ways entertained by surveyors themselves.

Methods of Preparing Tenders.

Another question arises as to methods of preparing tenders in lieu of the complete bill before the tender is accepted, and the system adopted, I believe, to a large extent in Scotland, is to obtain tenders on a schedule of prices, the actual work being measured thereafter, on the job, and priced in accordance with the schedule. That, no doubt, is an expeditious mode of obtaining tenders, but I do not think it would work so well in London, where architects and clients want to know exactly what a job is going to cost before the tender is accepted. By this method I believe the custom is to prepare a blank bill of quantities representing as near as possible what work will be required in the particular job, and the builder puts his prices to each item, the main absent part being the quantity of work required.

Then there is the method of obtaining tenders adopted by certain Government Departments, viz., to issue schedules of works required, with prices attached, the builder tendering on so much percentage above or below the prices affixed by the department. Perhaps we shall ascertain to-night what quantity surveyors think of these methods of obtaining tenders.

Quantities as Part of the Contract.

The question as to whether or not quantities should be made part of the contract has occupied for many years past the attention of all concerned in building operations. Personally there has never been a doubt in my mind as to the right system, and that is to make the quantities, in every case, part of the contract. I should not desire that through a mere clerical error my client obtained something for nothing, or that a builder succeeded in being paid for materials and labour which he never executed, simply because a clerk put down tons instead of cwts., or brought his brickwork into rods reduced before he had turned his 9in. work into 14in. work. It has been said by some surveyors, quite qualified to judge, that if the system I have above advocated were universally adopted, it would lead to slovenliness on the part of surveyors, but I do not think so. I believe that the respectable surveyor would be quite as careful in his work whether the quantities were, or were not, to be made part of the contract. I have, myself, always adopted the method of making quantities part of the contract, and unless you, gentlemen, urge good reasons for the contrary method, I shall go on in the same old way.

Legal Responsibility.

We might now consider for a few minutes the legal responsibility of the quantity surveyor, and I am not sure that in the case of an error on his part, either the builder or the client could sustain an action-at-law to recover the value of the error. I have not been able to look up recent decisions on this point, but I remember that a case was decided many years ago as to responsibility for payment of the quantity surveyor's fees, and that directly the contract was signed the responsibility for the fees shifted from the client to the contractor. On the point, however, of liability for payment for errors, I assume that unless negligence could be proved against the surveyor it would be difficult to recover damages. And I think this should be so; the idea of getting out of a surveyor, say, £500, for an error on a job for which his total commission may be £50, does not commend itself to me.

If he has overstated his quantities, the builder must give way; and if understated, the client must give way; and, of course, the quantities being made part of the contract, removes this question from practical consideration. One used to hear, years ago, of quantity surveyors paying sums of money to make good their errors, but there was always a certain vagueness about these payments, and I have not heard of any lately. I understand that in L.C.C. Works, and perhaps in other departments, quantity surveyors are made liable for errors, but I cannot understand their accepting this liability except in the case of real negligence, and I do not think the system should be adopted. Architects are only liable in the case of negligence, and I do not see why quantity surveyors should not be placed in the same category.

Dispensing with the Quantity Surveyor.

Another matter of interest to quantity surveyors occurs to me, and that is obtaining tenders without the employment of quantity surveyors. No doubt in small matters of alterations to a building a fully detailed bill of quantities is too elaborate a process, and drawings and specifications are quite sufficient to enable a proper estimate to be obtained; but I am afraid that in larger works the practice of asking builders to take out their own quantities is increasing. Some few years ago it was, I think, agreed by the Master Builders' Association that they would not tender for works (except, I presume, small and trifling works) unless the quantities were taken out; but any such agreement should be strictly adhered to by the whole of the Master Builders' Association, and whether this has been so adhered to, or not, I do not know, but I am afraid there have been strayers from the fold.

The "Stores" System.

There are one or two other matters to be thought of in which the direct work of the quantity surveyor is being got rid of, and this affects the architect as well as the surveyor. I refer to the very large and increasing amount of work being done by the various stores, and by large furnishing, decorative, and building firms, without the employment of independent architects and surveyors. These firms do not say so, perhaps, in so many words, but they pretty clearly indicate that by employing them direct all the architect's and surveyor's fees will be saved, and everything go along as happily as can be. Well, we in this room know all about that.

The Incursive Auctioneers.

Then I think auctioneers are gradually making incursions into the domains of architects and surveyors, right of light matters, party wall matters, little building matters, and other work which a quarter of a century ago was all done by architects and surveyors. Most certainly some stop should be put upon these encroaching proclivities; and, so far as architects are concerned, I and other members of the R.I.B.A. intend to direct attention to the subject at an early date. It may seem undignified to intervene in such matters, but the point is, are we to sit quietly by and see our legitimate work taken away from us?

Writing the Specification.

The question sometimes crops up as to the writing of the specification. I think that where an architect employs the same quantity surveyor for all his work, an abstract specification prepared by the architect is sufficient; and in that case the fully detailed specification should be written by the quantity surveyor, so that the specification and bills of quantities are in thorough agreement. But if there is a surveyor employed who is not well acquainted with the architect's particular style of work, then, no doubt, the detailed specification must be handed to the surveyor before he takes out the quantities. Sometimes the architect is asked for the

THE MANUSCRIPTS ROOM, NATIONAL LIBRARY, PARIS. VIEW OF ONE SIDE AND DETAIL OF A BRACKET.

specification by his client before the tender is accepted, but I have said, when I have been asked, that when the tender has been accepted without variations, or the variations arranged, then the detailed specification would be written; in the meantime the quantity surveyor had received all the information he needed to prepare his quantities.

The Question of Fees.

Now a word or two as to the charges of quantity surveyors. It is a subject for keen regret that surveyors have not kept up the standard of their professional charges in the same as, on the whole, architects have. One hears now of surveyors undertaking to do work at a perfectly ridiculous rate of pay, particularly as regards work for public bodies. Of course, if the case is one of a large asylum or of a building of great area, with a fair amount of repetition, a comparatively small rate of percentage is understandable; but these absurd rates are not confined to these public buildings, and it behoves this Quantity Surveyors' Association, and all kindred institutions, to consider seriously whether some sort of agreement cannot be arranged by which all duly qualified surveyors shall adopt, and stick to, some recognised general scale of charges. Of course, in the case of unqualified men, any remuneration is more than sufficient, but with competent surveyors with reputations to preserve, I feel quite sure from the remarks I have heard as to charges, that they hardly cover for working up, let alone all the establishment expenses and the surveyor's own time. I know that competition in everything is very keen just now, and that the "slap-dash" surveyor will pocket more out of his ½ per cent. commission than a good man will out of his 1½ per cent.; but it is not every architect or every public body who knows this.

My own view as to surveyors' charges is that for a complicated "Arty-Arty" house, with every window and every door different, 2½ per cent. is not too much; that for an ordinary building, say up to £20,000, 2 per cent. is fair; that for plain straightforward large warehouses with plenty of "timesing," 1½ per cent. should be charged; and I should be very sorry to hear that for the biggest public building less than 1 per cent. was ever charged. I am not speaking of work in which the largest items or the greatest part consist of provisional sums, but where the quantities have been fairly taken out with only a small proportion of provisional sums. As to charges for variations on contracts, I do not think a surveyor should be paid a large commission for omitting these provisional sums and then a heavy charge for measuring up the work executed under these provisions. The charge in the ordinary way for ordinary variations used to be 1½ per cent. for omissions, and 2½ per cent. for measured additions; and, bearing in mind all the trouble of re-abstracting, re-billing, etc., in the case of omissions, and measuring, pricing, etc., in the case of additions, I do not consider these charges unfair.

"Independent" Quantity Surveyor.

I have said that competition is dreadfully keen just now; and, of course, quantity surveyors cannot escape it. But there is a limit even to this, and I think the line should be drawn by quantity surveyors in sending out letters to clients about to build. I suppose there could be no real objection, if a surveyor heard of a job going, to his soliciting the work from an architect, but in a letter recently addressed to some clients of mine by a firm of quantity surveyors offering their services, after stating that they did not know who the architect was, but that it was quite likely he was a gentleman of eminence with whom they were already acquainted, they used these words, viz.:—"It is quite usual nowadays for public authorities and for large firms to employ independent quantity surveyors instead of leaving the appointment in the hands of the architect, and we hope that we may be favoured with your confidence."

Conclusion.

Well gentlemen, I have strung together a few thoughts on what is, after all, a very important practice—a practice which, for its successful pursuit, demands no ordinary ability; it requires highly technical skill, tact, judgment, and knowledge of the world; all are essential for the quantity surveyor's practice; and added to this must be constant and unwearied labour in watching the markets, and in studying new inventions in the building trade and in the applied arts and sciences. The profession is one to be upheld with dignity, and to be pursued with strict regard to its rights and privileges, and I venture to conclude this paper by the expression of a strong hope that your members will be quite united in the desire and in the determination to render your work more sought after, and its value better appreciated.

Discussion.

Mr. S. Chatfeild Clarke, having proposed a vote of thanks, which was seconded by Mr. S. A. Stanger, and supported by Mr. Arnold E. Harris, Mr. H. H. Bartlett, Mr. W. A. Haskins, Mr. W. E. Davis, Mr. Allan Paul, and Mr. Assiter, who all spoke at considerable length,

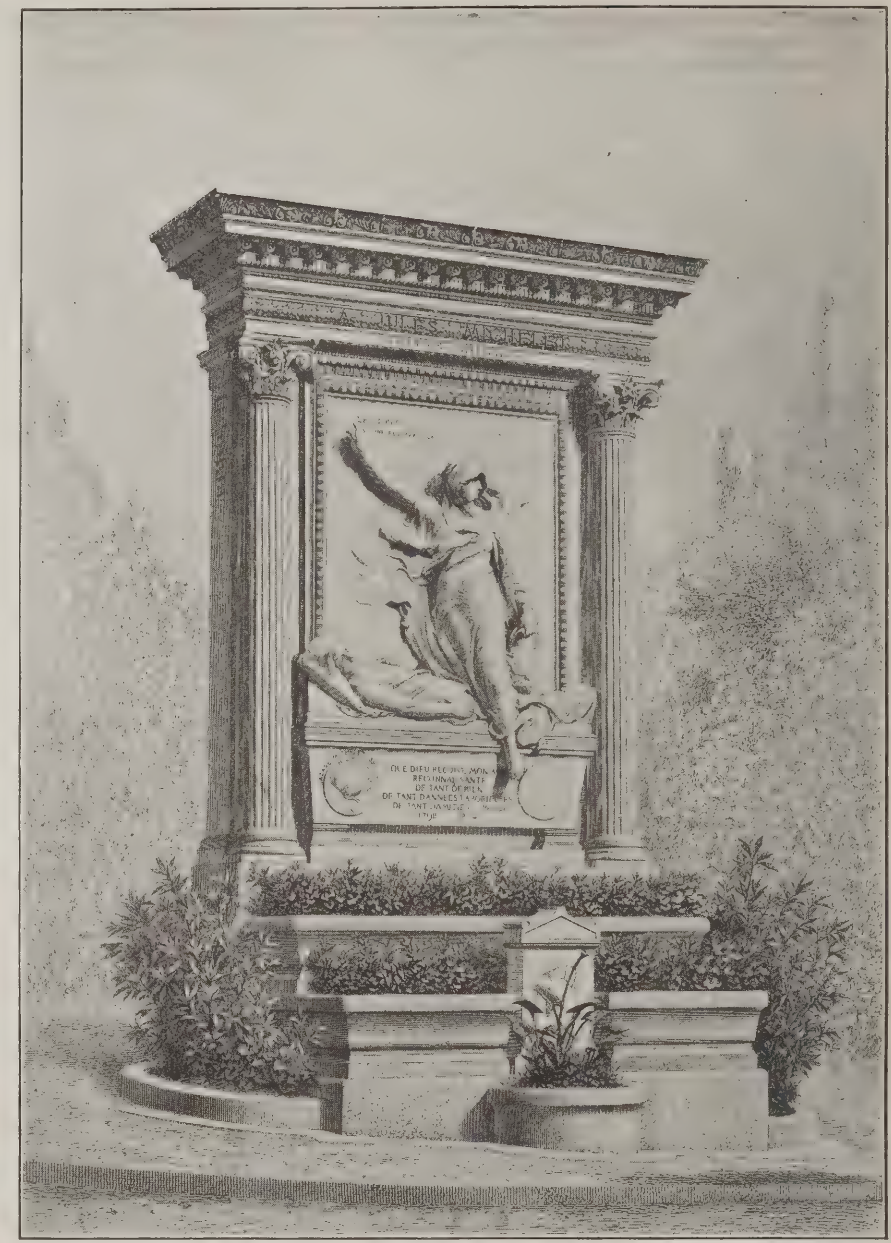
The President said that he should not at this late hour attempt to go all through the notes he had made, but he would like just to allude to the subject of the charges of quantity surveyors. No doubt the unfortunate fact exists that many surveyors have been tempted from time to time to respond to invitations to tender for quantities. In the fact of merely tendering, of course, there is no objection. Our friends the builders are tendering all day and every day, and the mere fact of doing so is nothing to do with it, but the question of tendering for quantities is a very different kind of thing from tendering for the supply of labour and materials. It means this, that if a man who is tendering for quantities puts in, as so many men have put in, ridiculously low prices, he cannot give the work which a client is entitled to expect when he asks for a bill of quantities. Of course, if a client will not pay, he cannot expect to have the work; but, on the other hand, the quantity surveyor ought not to allow himself to tender in the way some have unfortunately done. Public authorities are still apt to take advantage of the quantity surveyor, and he hoped those present would in every way support the policy of the Association. It is a very difficult question to deal with, he admitted, but the Council of this Association takes a very strong view indeed of quantity surveyors' duties in this matter. This Society is doing its very best to raise the status of the profession of quantity surveyors, and he was sorry that some of its friends still feel called upon to remain outside. He hoped that they would reconsider their position as to whether or not they could support this Society in its strenuous efforts to raise the status of the quantity surveyor, and to maintain its dignity as an honourable profession. They could never hope to raise the status of the profession and to carry out the suggestions made, unless they did combine. Architects found it necessary to do so, and they are very strict indeed in carrying out the regulations of their associations. Workmen have found it necessary to combine. Trades unionism is a very strong and potent force in the land, as we know to our cost perhaps; workmen find themselves able to dictate what remuneration they shall receive, and he (the President) failed to see why quantity surveyors should not be equally capable of combining to protect their own interests.

Mr. Woodward having replied, the meeting terminated.

THE CONCRETE INSTITUTE.

The first meeting of the Concrete Institute this session was held last Thursday evening at The Royal United Service Institution. Owing to the indisposition of Mr. Edwin O. Sachs, chairman of the Executive, the chair was taken by Mr. A. Ross, M.Inst.C.E., engineer to the G.N. Railway, who announced that the membership had risen to a total of 855.

Mr. Richard Humphrey, M.Am.Soc.C.E., who had consented to read a paper on "Some of the Application of Reinforced Concrete in America," was, owing to his manuscript having gone astray on the Continent, unable to read the paper he had prepared; but gave an extempore lecture instead, illustrated by a number of lantern slides. He emphasised the great need for further study and research into the question of reinforced concrete, detailing a number of points which required further elucidation, such as authentic data on continuous beams, the connection of beams and stanchions, the question of expansion and contraction, corrosion, the action of sea-water, etc. Their practical application of the material had gone far beyond their theoretical knowledge of it; and it was of vital importance that the research work should be brought up to date and kept level with their practical use. He thought if they went on in their present way, especially in America, the result might be disastrous. He gave details of the many tests and experiments being made in America. He had some 15 years' experience of the material in America, and had seen practically all the important works there, and his recent visit to Europe had been undertaken for the purpose of studying Continental practice. Personally, he thought the possibilities of concrete were limitless. One thing that had particularly impressed him in Europe was the artistic use of the material. In Germany and Austria he had seen many really beautiful structures in reinforced concrete. In America the material had mainly been used in a purely utilitarian way, and their progress had not been so rapid. The difficulty there, as here, was that the architect knew little about the material, and having been brought up in the old traditions of brick and stone, could not easily be brought to realise the possibilities of the new material. He required educating in the use of this, a plastic material, and once he had grasped its qualifications, this construction would rapidly advance. One thing that he had been very much struck by on his Continental travels was the question of mixing. He had seen concrete put in so dry that it required considerable tamping to bring the moisture to the surface. He thought that a great mistake, and he desired to emphasise the extreme importance of the mixing operation. After all, there must be a right and a wrong way of mixing, and it was therefore desirable to determine what the right way was. In America they had from mixing concrete too dry gone to the other extreme of mixing it too wet, so that the cement was practically washed out of the material. Now they had adopted the happy medium of mixing concrete neither too wet nor too dry. He paid a warm tribute to the present excellent cements that were produced; there was no finer building material made to-day. Though this might partly be attributed to the stringency of the specifications, he felt that the cement should have its due, and that it was often due to the excellence of the cement that faults in design and negligence in construction did not more often meet with the disastrous results that might be anticipated.



MONUMENT TO JULES MICHELET, EAST CEMETERY, PARIS. J. L. PASCAL, ARCHITECT.

The lecturer then proceeded to show his slides, representing all kinds of uses for concrete and reinforced concrete in the United States, from the building of bridges to the manufacture of garden furniture and ornaments, giving short disquisitions on each class of subjects. Two or three bridges showed the gradual progression of design from the copying of stone bridges to the lighter form of design now prevalent, and the elimination of the solid haunches. Other pictures followed of irrigation canals on the desert plains of the Pacific Coast, where timber was absent except for short scrub, and where the abundance of gravel and sand made concrete the only practical material to use. Pictures of farm buildings, grain silos, and water tanks followed, and the latter raised the question of the development of cracks and consequent leakage. The lecturer said that the insertion of steel for the purpose of meeting the changes of expansion and contraction, quite apart from that required to take the stresses, was the only effectual method of dealing with the difficulty. House building, said Mr. Humphrey, as several slides of houses were shown, was not very satisfactory at first owing to the poorness of the designs, but several slides were shown of a large house in the Renaissance style which the lecturer considered showed the artistic possibilities of the material. Tall chimney stacks brought up the interesting point concerning their elasticity under wind pressure. The lecturer instanced a case of collapse which was found to be due to want of elasticity. Concrete chimneys were practically built in rings and sections, each ring representing a day's work; and the various stages were very clearly marked in some of the views given. It was not easy to make an effectual join between the work of one day and the next, and the collapse in question was due to oscillation and subsequent fracture along the horizontal line of one of these joints. The difficulty was now obviated by the use of lime at these joins, which gave a less rigid joint than cement, and allowed for the necessary elasticity in the structure. Piles, Mr. Humphreys said, were a very valuable form of reinforced concrete construction, but he thought that there was no doubt that sea-water affected concrete. It had been very strongly demonstrated by actual tests that cement was affected by sea-water, and especially so in cases where wet concrete was deposited under sea-water. Some skyscraper stores and warehouses led the lecturer to remark that these buildings could be erected as cheaply, if not more cheaply, than with the more ordinary forms of construction. He instanced buildings of this class in reinforced concrete, which had been erected at a price per foot cube, of from 8 to 10 cents. Another application of concrete was in the manufacture of concrete sleepers for railways. Most of the big American lines had experimented with them and laid down trial stretches, such as the one shown on a slide. The early results had not altogether been satisfactory, because with these the rails were bolted direct to the sleeper, and it was found that the concussion of the heavy locomotives tended to shatter the sleepers. A number of patent concrete sleepers were now on the market with wooden blocks let in to take the rails and provide an elastic pad to eliminate the shock. Concrete sleepers did not as yet vie in point of cost with wooden ones; but the dearth of timber, its increasing price, and the difficulty of finding suitable wood, made it inevitable that some material like concrete would have to be employed in the near future.

The concluding slides were of laboratory testing apparatus, and open-air tests with slabs and beams, and of tests for fire-resistance, including a view of the giant testing machine for full size stanchions, etc., which we illustrated some time back. At the conclusion of his remarks, the lecturer was warmly applauded.

The chairman said that they were greatly indebted to Mr. Humphrey for the excellent extempore lecture he had given them, and for the many interesting points he had touched upon. Though the paper was not the one he had intended to give, he thought Mr. Humphrey would not object to answering any question.

Mr. C. F. Marsh, in moving a vote of thanks, said he was glad to say that the practice of mixing the concrete neither too wet nor two dry was one he personally always adhered to. He thought that the United Kingdom was too small a place to have the opportunities for the large buildings and bridges that were required or permitted in the United States. The by-laws here had prohibited the use of outside walls in reinforced concrete; but now that the London Building Act had been amended in this respect, he thought the architect would get his chance. As to cost, in a building erected by the Metropolitan Water Board, in which the structure was wholly in reinforced concrete, excepting the outer walls, he had worked out the cost as 4.6 pence per cube, a price practically identical with that mentioned by Mr. Humphrey. In concrete chimneys he thought it was the general practice to use lime at the joints in England. The worst feature of concrete construction were the cracks due mostly to temperature, and this had very grave effects on structures built to resist or retain water. He very much doubted whether it was possible to make concrete water-tight without the use of some impervious lining. The concrete roadway shown on one of the slides was extremely interesting, and might be worth trying in England. The method shown in other slides of building concrete houses by moulding whole walls in a horizontal position and raising them to the vertical by means of jacks, afterwards inserting the floors and joining up the corners, was also interesting, but he was afraid they would come down like a pack of cards in a high wind, and he, personally, would not care to live in such a house, especially in America, where they were subject to earthquakes.

Mr. Seraillier asked whether the concrete sleepers were set as close together as they appeared to be in the picture, and, in reply, the lecturer said that they were laid at the distance usually employed for wooden sleepers. Possibly the effect on the slide was due to foreshortening.

Answering another member who asked whether the curved dam shown, which had resisted the earthquake that destroyed San Francisco, was built of plain or reinforced concrete, the lecturer replied that it was built of plain concrete laid in blocks that interlocked, that was that the blocks were laid in rows and concrete filled in between them keyed into them.

Answering another question, Mr. Humphrey said the only way to obviate cracks in walls was to put in reinforcement specially to take the expansion and contraction. Another question on the subject of condensation elicited the reply that it was necessary to insulate the wall. Even the hollow block walls had not proved altogether satisfactory. A member intervened to say that at Harrogate there were houses built of hollow blocks, plastered direct on the block and papered that were perfectly dry.

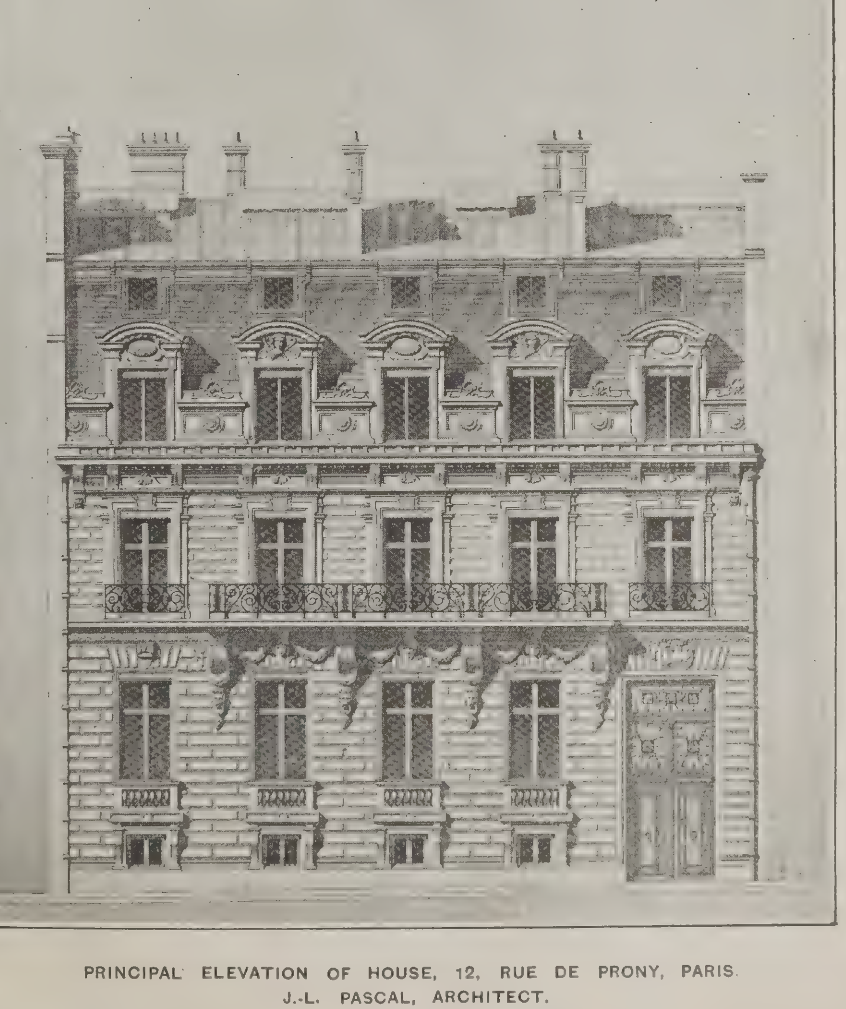
Mr. Wentworth Shields wanted to know whether the wooden cushion in the concrete sleepers had proved efficacious. He did not gather from the lecturer's remarks what had been the result of the innovation. When cold storage buildings were first built of concrete, it was hoped the poor conductivity of the concrete would prevent the heat penetrating into the cold rooms. But at Southampton, where they had a big cold store, it was found necessary to put in an insulation of wood and sawdust. He also desired to know Mr. Humphrey's opinion as to the best material to put on a flat concrete roof.

Mr. Etchells mentioned that Mr. Humphrey was their Envoy to America in the matter of the co-ordination of symbols. Having failed to agree to conform to the Continental notation, they were hoping to form an entente with America on the subject. He desired to know whether the beams, bench-moulded and brought on the site, were, in Mr. Humphreys' opinion, as strong or stronger than those moulded in situ.

Mr. H. G. Bamber thought that where concrete had been affected by the action of sea-water, it was due to faulty construction. The addition of pozzalano to concrete so exposed had been advocated, and experiments on the same line as those in America were being conducted here. The damage mentioned occurring to concrete deposited under the water was, he thought, less serious than supposed, and was mainly confined to the surface. On the subject of corrosion, he produced a piece of a drill, which had been accidentally buried in a concrete sea wall at Barbadoes for over 40 years, which had been sent over for the inspection of those members charged with an investigation into this subject. Its condition he considered absolute proof of the preservative qualities of well made concrete.

Mr. Humphrey, answering some of the later questions, said it was too soon to speak of the success of the sleepers with the wooden cushions. There were other points in the matter, such as the complaint of the locomotive engineers that the rigidity of these sleepers damaged the locomotives. Concrete cold storage buildings had to be insulated; it was customary in America to do so. As to concrete roofs, if they had not been properly reinforced, and had cracked, it was necessary to cover them with some elastic material like tarred felt, asphalt, etc. No other course was permanent or effectual. Personally, he preferred beams moulded in situ.

The vote of thanks having been formally seconded, was put and carried by acclamation.



PRINCIPAL ELEVATION OF HOUSE, 12, RUE DE PRONY, PARIS.
J.-L. PASCAL, ARCHITECT.

THE PLUMBERS' COMPANY'S APPRENTICESHIP BOARD.

The Plumbers' Company, of which the present Lord Mayor (Alderman Sir John Knill) is Master, attaches great importance to the training of the plumber. In no craft are skill and efficiency more vital to the common interest. It is estimated that of the total quantity of water conveyed to London for the daily needs a quarter or a third is wasted owing to defects in the mains. This is merely a financial matter, but where drainpipes are badly laid, the health of the community is endangered. Some years ago, with a view to raising the standard of all plumbing work, the Plumber's Company instituted an Apprenticeship Board, the members of which were representatives of the Company, of the Master Plumbers' Association, of the Operative Plumbers' Association, and of others concerned. The Company has a register of apprentices indentured to approved employers, the Company standing sponsor, so to speak, for each apprentice. From time to time the Company, as provided by the conditions of the indenture, inspect the note-books and drawings of the apprentices attending technical classes in plumbers' work, and inquire as to their attendance. This system of modernised apprenticeship—part practical work and part instruction in the underlying principles—is linked up wherever possible with the Company's system of registration of qualified plumbers all over the Kingdom by means of the various local councils. Excellent reports respecting the progress of the work of revived apprenticeships have been received from Dumfries and from Glasgow. At the last Court of the Company awards were made for excellent work and satisfactory attendance at the classes during the year.

In 1906 the Company identified itself with the arrangements for a conference of labour, municipal, and education representatives with a view to definite co-operation of those interests, and this conference was held at the London Guildhall under the presidency of the late Viscount Selby. A committee was then appointed to inquire into the whole system of industrial education and apprenticeship, and to report to an adjourned conference. This committee has since its appointment collected and collated a vast amount of valuable information from trade unions, trade councils, municipal authorities, engineers, architects, large employers of labour, educational authorities, Chambers of Commerce, and others, for submission to the adjourned conference. Working plumbers themselves regard apprenticeship very favourably. In fact, their trade union, the Plumbers' Association of Great Britain and Ireland, which has branches in all the cities and towns of the United Kingdom, has passed resolutions strongly advocating the principle. Moreover, the question of apprenticeship is taken into consideration by the various registration councils of the National Registration of Plumbers in deciding as to the eligibility of an applicant for entry on the list of registered plumbers. To the present Lord Mayor and his father, the late Sir Stuart Knill, who preceded him as Master of the Plumbers' Company, is largely due the success which has attended the efforts of that Company in helping to revive the apprenticeship system, as well as to secure the registration of properly qualified plumbers.

A NEW THEORY OF PROPORTION.

A lecture on "A New Theory of Proportion, as applied to the Facades of Grecian Temples," was delivered by Mr. G. S. Aitken, architect to the Edinburgh Architectural Association, on November 17th, Mr. John Watson, F.R.I.B.A., President, in the chair.

After reference to Vitruvius, to the work done by Sir James Pennethorne and Mr. Penrose, on the optics and refinements of Greek architecture, and to the system of proportion formulated by Mr. Watkiss Lloyd, and to Mr. D. L. Haig's labours in the middle of the nineteenth century, and Professor Kelland's approval of them, the lecturer thought however, that Mr. Haig's interesting theories did not accord with the facts of the Parthenon to which he applied them. A solution was sought in a letter of Sir Isaac Newton's, where a remark about the sides of polygons graduating with rectangles furnished a workable basis.

The remainder of the lecture was devoted to this, and took the form of applying the angles of 60 degrees and 30 degrees, which arose out of the hexagon, and of 67½ degrees, 45 degrees, and 22½ degrees, furnished by the octagon, to a series of thirty-one Greek temples, in which it was shown that they could all be built up from the given basal line of the upper step of the stylobate, by using these singles, or combinations of them with arcs of circles to determine the height of the columns, and of the entablatures and pediments.

The Thescum, for instance, is worked out by employing an angle of 22½ degrees for the lower part, and of 30 degrees for the upper part of the facade. A divided line of 60 degrees fixed the diameter of the columns, and interesting angles of 45 degrees and 30 degrees determined the depth of the stylobate. The application of angles varied according to the effect which the Greek architect desired to produce.

It was pointed out, in conclusion, that the use of the law that regulated the design of the Greek temples, would be to the æsthetic advantage of modern architecture, and that successful acoustics depended upon the knowledge of it.

CHATEAU DE MAUBUISSON. CLAIREFONTAINE (SEINE-ET-OISE). EAST FRONT.
J.-L. PASCAL, ARCHITECT.

SLATING AND ROOF TILING.

Measurement Codified.

We have received copies of pamphlets showing, respectively, (1) the "Customary rules of measurement codified by the principal master slaters and tilers in the London and South of England Districts," revised to date in accordance with the standard system of measurement of slating and tiling; and (2) "The standard system of measurement of slating and roof tiling as agreed upon by the Council of the Quantity Surveyors' Association and the London Association of Slate Merchants and Master Slaters." Both pamphlets can be had, price 2s. 6d. each, from the Hon. Treasurer, London Association of Slate Merchants and Master Slaters, 25/26, Bermondsey Wall, London, S.E.

The following are the customary rules of measurement as codified and revised by the Standard System of Measurement, as given in pamphlet (1). The second pamphlet embodies the same data in a form suitable for quantity surveyors.

Slating.

Slating.—Net area, after deducting all openings containing 4ft. superficial or over.

Mansard, Vertical, Dormer Cheeks, small surfaces under 10ft. superficial, circular Conical, Octagonal or Turret Roofs to be measured separately.

Eaves.—A lineal measurement to be taken to the equivalent of 12ins. deep.

If irregular or cut to follow drips of gutters an extra measurement of 6ins. to be taken.

In the case of all Random Slating add a further 6ins.

If bedded or pointed, to be charged separately.

Verges.—A lineal measurement equivalent to 6ins. wide to be taken at all square Verges, and Secret Gutters.

If on rake take an additional 6ins.

If slate and a half or special wide slates are used add a further 12ins.

Top Edge.—A lineal measurement equivalent to 6in. deep to be taken on either side of Ridges, under sills of Dormers, Lanterns, Skylights, and any openings where top course slates are used.

Square Abutments.—A lineal measurement equivalent to 6ins. wide to be taken where Slating adjoins sides of all Chimney Stacks, Dormers, Skylights, and other openings; also at one end of slope where Slating finishes between parapet or party walls.

Circular Cutting.—A lineal measurement equivalent to 12ins. wide to be taken.

Raking Cutting.—A lineal measurement equivalent to 6ins. wide to be taken at all rakes.

Valleys.—A lineal measurement equivalent to 6ins. wide to be taken on both sides of all valleys.

If special wide slates or slate and a half are used take an additional 12ins. on both sides.

Hips and Angles.—A lineal measurement equivalent to 6ins. wide to be taken on both sides of all Hips and Angles.

If special wide slates or slate and a half are used, take an additional 12ins. on both sides.

Mitre Cuttiug.—A lineal measurement to be taken for all Mitres (in addition to the usual cutting), whether at Hips, Valleys, or other places where slates are close cut; to include all necessary oil cement.

Ridge and Hip Coverings.—A lineal measurement of all Ridges and Hips, including setting and pointing in cement.

CHATEAU DE MAUBUISSON. CLAIREFONTAINE (SEINE-ET-OISE). WEST FRONT.
J.-L. PASCAL, ARCHITECT.

All Splays, Cut Ends, Mitres, Intersections and Top Ends to be numbered and taken separately.

Tiling.

Tiling.—Net area, after deducting all openings containing 4ft. superficial or over.

Mansards, Vertical, Dormer Cheeks, small surfaces under 10ft. superficial, Circular, Conical, Octagonal or Turret Roofs to be measured separately.

Eaves.—A lineal measurement equivalent to 8ins. deep.

If irregular or cut to follow drips of gutters, an extra measurement of 6ins. to be taken.

If bedded or pointed, to be charged separately.

Verges.—A lineal measurement equivalent to 6ins. wide to be taken at all square Verges and Secret Gutters.

If on rake take an additional 6ins.

Top Edge.—A lineal measurement equivalent to 6ins. deep to be taken on either side of all ridges, under sills of Dormers, Lanterns, Skylights, and any openings where top courses are used.

Square Abutments.—A lineal measurement equivalent to 6ins. wide to be taken where Tiling adjoins sides of all Chimney Stacks, Dormers, Skylights, and other openings; also at one end of slope where Tiling finishes between parapet or party walls.

Circular Cutting.—A lineal measurement equivalent to 12ins. wide to be taken.

Raking Cutting.—A lineal measurement equivalent to 6ins. wide to be taken at all rakes.

Valleys.—A lineal measurement equivalent to 6ins. wide to be taken on both sides of all Valleys, including all necessary tile and a half.

Bedding and pointing to open Valleys to be charged separately.

Valley Tiles to be measured extra only, over the usual measurements on both sides.

Hips and Angles.—A lineal measurement equivalent to 6ins. wide to be taken on both sides of all Hips and Angles to include all necessary tile and a half.

Hip and Angle Tiles to be measured extra only, over the usual measurement on both sides.

Mitre Cutting.—A lineal measurement to be taken for all Mitres (in addition to the usual Cuttings) whether at Hips, Valleys, or other places where tiles are close cut, to include all necessary tile and a half.

Ridge and Hip Coverings.—A lineal measurement of all Ridges and Hips, including setting and pointing in cement.

All Splays, Cut Ends, Mitres, Intersections and Stop Ends to be numbered and taken separately.

Societies' Reports.

Glasgow and West of Scotland Technical College.

The annual report of the one-hundred and thirteenth session of the Glasgow and West of Scotland Technical College shows continued development in the work of the college, the number of students being 5,824. In the department of Architecture and the Decorative Trades, there were 50 day students and 688 evening students—total, 738, and in the plumbing classes there were 414 evening students. It is noted that the third section of the new buildings, which completes the facade to George Street, has been finished, and will be occupied next session; while the site for the fourth section, facing John Street, has been cleared, and considerable progress has been made with the foundation work, and it is hoped that the section will be ready for occupation in September, 1910. It is stated that the joint committee of the School of Art, and the college, in charge of the School of Architecture, have approved a proposal of the Director of Architectural Studies, that the diploma of the school be awarded only to students who have attended day classes for a period equivalent to two sessions. Mr. T. L. Watson, F.R.I.B.A., is convenor of the governors of the Committee on Architecture; Mr. James M. Monro, F.R.I.B.A., and Mr. Alexander Wingate, representing the Glasgow Institute of Architects.

The fourth meeting of the session was held in the College Buildings on Friday, 19th inst., when Mr. F. L. Hastie delivered a lecture, the subject being, "A Framed Building." At the outset Mr. Hastie drew attention to two main factors in steel construction, viz., economy and strength, and pointed out that all such buildings should be designed at the lowest possible cost—not necessarily cheap work, but substantial. He then described by use of illustration the methods of setting out, and the means of calculating the strength and section of the component parts. Several points of construction were also shown. The preservation of steel work was also described, and the lecture concluded with reference to the specification and the preparation of schedules for such work. Mr. Colin Sinclair, M.A., opened a discussion, in which several members took part.

Northern Architectural Association.

A meeting of the students of the Northern Architectural Association, Newcastle-on-Tyne, was held on Wednesday, November 20th, when Mr. J. G. Smith read a paper entitled "Portland Cement Manufacture and Testing." After giving a brief outline of the history of its manufacture, Mr. Smith dealt with the great progress made in recent years in the grinding of cement, his remarks being accompanied by practical demonstrations of passing cement through a sieve of 32,400 holes per sq. in. Mr. Smith also described the expansion test, which has been welcomed by many cement manufacturers, who see in its adoption the more equal consideration of a cement whose strength is progressive, than one which, while giving a superior result on the seven days' tensile test, yet deteriorates afterwards. During the evening students were afforded an opportunity of examining a testing machine, a number of briquettes being tested for tensile strength. Previous to the meeting the students partook of afternoon tea on the invitation of the President.

Notes and News.

Messrs. Saunders, Todd and Co., manufacturers' agents, Maritime Buildings, Newcastle-on-Tyne, inform us that they have been appointed agents for Northumberland and Durham for Messrs. Gibbs and Canning, Ltd., of Tamworth, terra-cotta manufacturers.

* * *

Lady Evelyn Guinness has unveiled a memorial to "Ouida," which has been erected at the west entrance to the town of Bury St. Edmunds, near the house where the authoress was born. It takes the form of a rectangular fountain basin, from the centre of which rises a pier flanked by two symbolic figures in bronze, one representing Sympathy and the other Courage. The principal face of the pier is occupied by a bronze relief portrait of "Ouida," and the arms of Bury St. Edmunds.

Last year's Belgian tour undertaken by the Sheffield and Yorkshire master builders was brought vividly before the minds of those of them who were present at a lecture in the Builders' Exchange, Sheffield, last week. The subject was, "Cities of Belgium," and was dealt with in an interesting manner by Mr. J. Batey. Excellent lantern illustrations added to the interest of the lecture, which was promoted by the Building Trades Exchange and Club.

* * *

We learn from the Natal Government Agency that as from the 1st January next, the preference on railway rates from Delagoa Bay to railway stations in the Transvaal between Germiston and Klerksdorp, inclusive, will be reduced in favour of Durban as follows:—Intermediate class by 2s. 11d. per ton; intermediate "B" class by 1s. 3d. per ton; in rough, rough "B" and "C" classes 2s. 1d. per ton; imported produce, fencing, fertiliser classes, 10d. per ton. This is *in addition* to the reduction effected on the 1st July last, which was as follows: — Intermediate classes by 2s. 11d. per ton; intermediate "B" classes by 2s. 11d. per ton; rough goods "B" and "C" classes by 2s. 1d. per ton; fencing, fertilisers, imported produce, by 10d. per ton. The intention of the further reductions is to divert a portion of the trade at present travelling by Delagoa Bay, it having been found that the reduction made on 1st July last was insufficient to accomplish that object. Attention is directed to the advantage of consigning goods via the Port of Durban, as the effect of the further revision in rates is that the difference in favour of Delagoa Bay will be only 4s. to 5s. per ton, after allowing for the additional shipping freight and expenses at the latter port, which difference is outweighted by the superior facilities for wharfage, handling, trucking, and transportation of consignments of all descriptions at the Port of Durban. Full information will be supplied on application to the Commercial Agent, Natal Government Agency, 26, Victoria Street, S.W.

Messrs. Drew-Bear, Perks and Co., Ltd., of Battersea Steel Works, Wellington Road, London, S.W., have been entrusted with the contracts for steelwork at the New Grenville Hotel, Bude, Cornwall; Wellington House, London, S.W.; and in the reconstruction of No. 2, Seamore Place, Park Lane.

* * *

Arrangements have been completed for the construction of a new goods railway line at Coventry, estimated to cost about £2,000,000. This extension will connect with the main line to the Metropolis, and also join the Nuneaton branch line, serving various important collieries.

* * *

At the morning service in Winchester College Chapel, on November 22nd, Dr. Burge, the Headmaster, dedicated a new organ, which has been placed in the new gallery, erected from designs by Mr. W. D. Caröe, at the west end. The instrument which is still incomplete, includes some of the pipes and two of the stops of the organ built in the Chapel by Renatus Harris in the reign of Charles II. It is played from a console placed in the old organ chamber at the north-west end of the chapel, where a new gallery has been built for the purpose. The Warden of Winchester (Sir Kenneth Muir-Mackenzie) and Mr. Mark Hambourg were present at the service.

* * *

Mr. Thackeray Turner, secretary of the Society for the protection of Ancient Buildings, recently wrote to the Royal Commission on Historical Monuments (England) inquiring whether the Whitgift Hospital, Croydon, had been placed on the list of monuments decided by the Commission, in accordance with the terms of reference, to be most worthy of preservation. Mr. George H. Duckworth, secretary, states in his reply: "The Commission have not yet begun their investigations in the County of Surrey, and therefore no list of 'selected' monuments in that county is as yet in existence. But, at the same time, I am to add that the Commission have good reason to believe that the hospital will be so included when the time comes, and they trust that some means may be found to secure its complete preservation." The Ruri-Decanal Chapter of Lambeth have unanimously passed a resolution praying the Croydon Council to find some other means of meeting the public convenience than by destroying the hospital. It is recalled that the hospital was founded for the poor of Croydon and Lambeth alike, and the question is now being asked to whom does it belong, and it is considered that the whole question must shortly be the subject of public inquiry.

SURVEYORS AND TOWN PLANNING.

At the Surveyors' Institution, Westminster, Mr. W. R. Davidge addressed the members on the subject of town-planning systems. He said that in many of the newer cities of the world which had been completely planned from their very commencement, the result was the construction of a fine and spacious town, but the very regularity of such a city might become almost painful. The disadvantages to which a strictly rectangular system was subject, if there were no diagonal or other streets in an oblique direction, was plainly apparent.

The radiating system was perhaps the ideal one, if the "hub" was of sufficient attraction or importance to the community. This idea, however, must be carried out in such a way as would not oppress the beholder with a sense of monotony or wearisome repetition of precisely the same vista, however beautiful. Probably the cities which really most charmed them and which lived in their memories long years after they had visited them, were the quaint old-world places, with their irregular streets, their quiet, dreamy squares, or their bustling market places withal overshadowed by some grey old minster or some monument of the past; or perhaps their thoughts strayed to some quaint cluster of houses nestling round its village green.

Much of the charm of these cities was undoubtedly due to their associations and to the atmosphere of antiquity which surrounds them, but beyond all these there were many things which might well be studied with advantage by the most up-to-date of town-planners. Town after town of mediæval times owed its picturesqueness, its quaintness, and often much of its artistic charm to the skilful grouping of the buildings, and, perhaps above all, to the intuitive sense of proportion in the —to us— haphazard dimensions and arrangement of the public "places," and to the irregular outlines of the street frontages.

In town planning each town must have an individuality of its own and natural assets, such as hills, woods, and water, must be preserved and extended. Long, straight streets, when adopted, should have a definite "motive," but slight curves or irregularities in frontage lines might in many cases be adopted with advantage. Line of sight should, in most cases, be restricted within reasonable limits, i.e., lines of long streets should be broken, and all views should as far as possible be framed in a suitable setting. The grouping or arrangement of the principal buildings and open spaces should in all cases be specially studied with a view to securing the best effect for the whole. No planning scheme could be considered as complete without a sufficiency of open spaces, and due regard must be paid to proportion and to architectural design.

Proposed New Works.

BELFAST.—A L.G. Board enquiry has been held into the application of the Corporation for a loan of £30,00 to erect a new public abattoir, and £2,750 for providing a disinfecting station.

BO'NESS. The North British Railway Co. are seeking to acquire land near the Bo'ness Electricity Works for the purpose of erecting a station.

BUCKHAVEN AND METHIL. — The Town Council are about to erect a public abattoir here at a cost of £4,500. Mr. W. D. Telfer, Burgh surveyor, has prepared the plans.

BURY.—The L.G. Board has held an enquiry into the application of the Corporation for a loan of £15,500 for the building of 52 working class dwellings in Bolton Road.

DUBLIN.—The Finance and Leases Committee of the Corporation have recommended the erection of new municipal offices in Lord Edward Street at a cost of £30,000 to £40,000.

DURHAM COUNTY.—The County Council have decided on the recommendation of their Education Committee to build new schools at Butterknowle and Tow Law.

EDINBURGH.—Another addition is to be made to the public slaughterhouse at Gorgie, consisting of a two-storey building, comprising tripery, piggery, pennage, slaughter-hall, cooling-hall, mess rooms, offices and stores.

GREENOCK.—A new drill hall for the Greenock Territorial battalion is to be erected at the junction of Kelly Street and Finnait Street. The building, which will provide accommodation for 1,100 men, will cost between £4,000 and £5,000.

METHYR.—The County Borough Council have applied for a provisional order to acquire a site for the purpose of erecting a central library and education offices, and for power to raise moneys for the erection thereof.

MIDDLESBROUGH.—The Town Council have passed plans for a skating rink to be erected in Park Road South. The building was to be steel-framed, covered with weathered timber, and would accommodate about 2,500 people. There would be six exits, and the building would be lighted with electricity. Mr. W. Duncan is the architect.

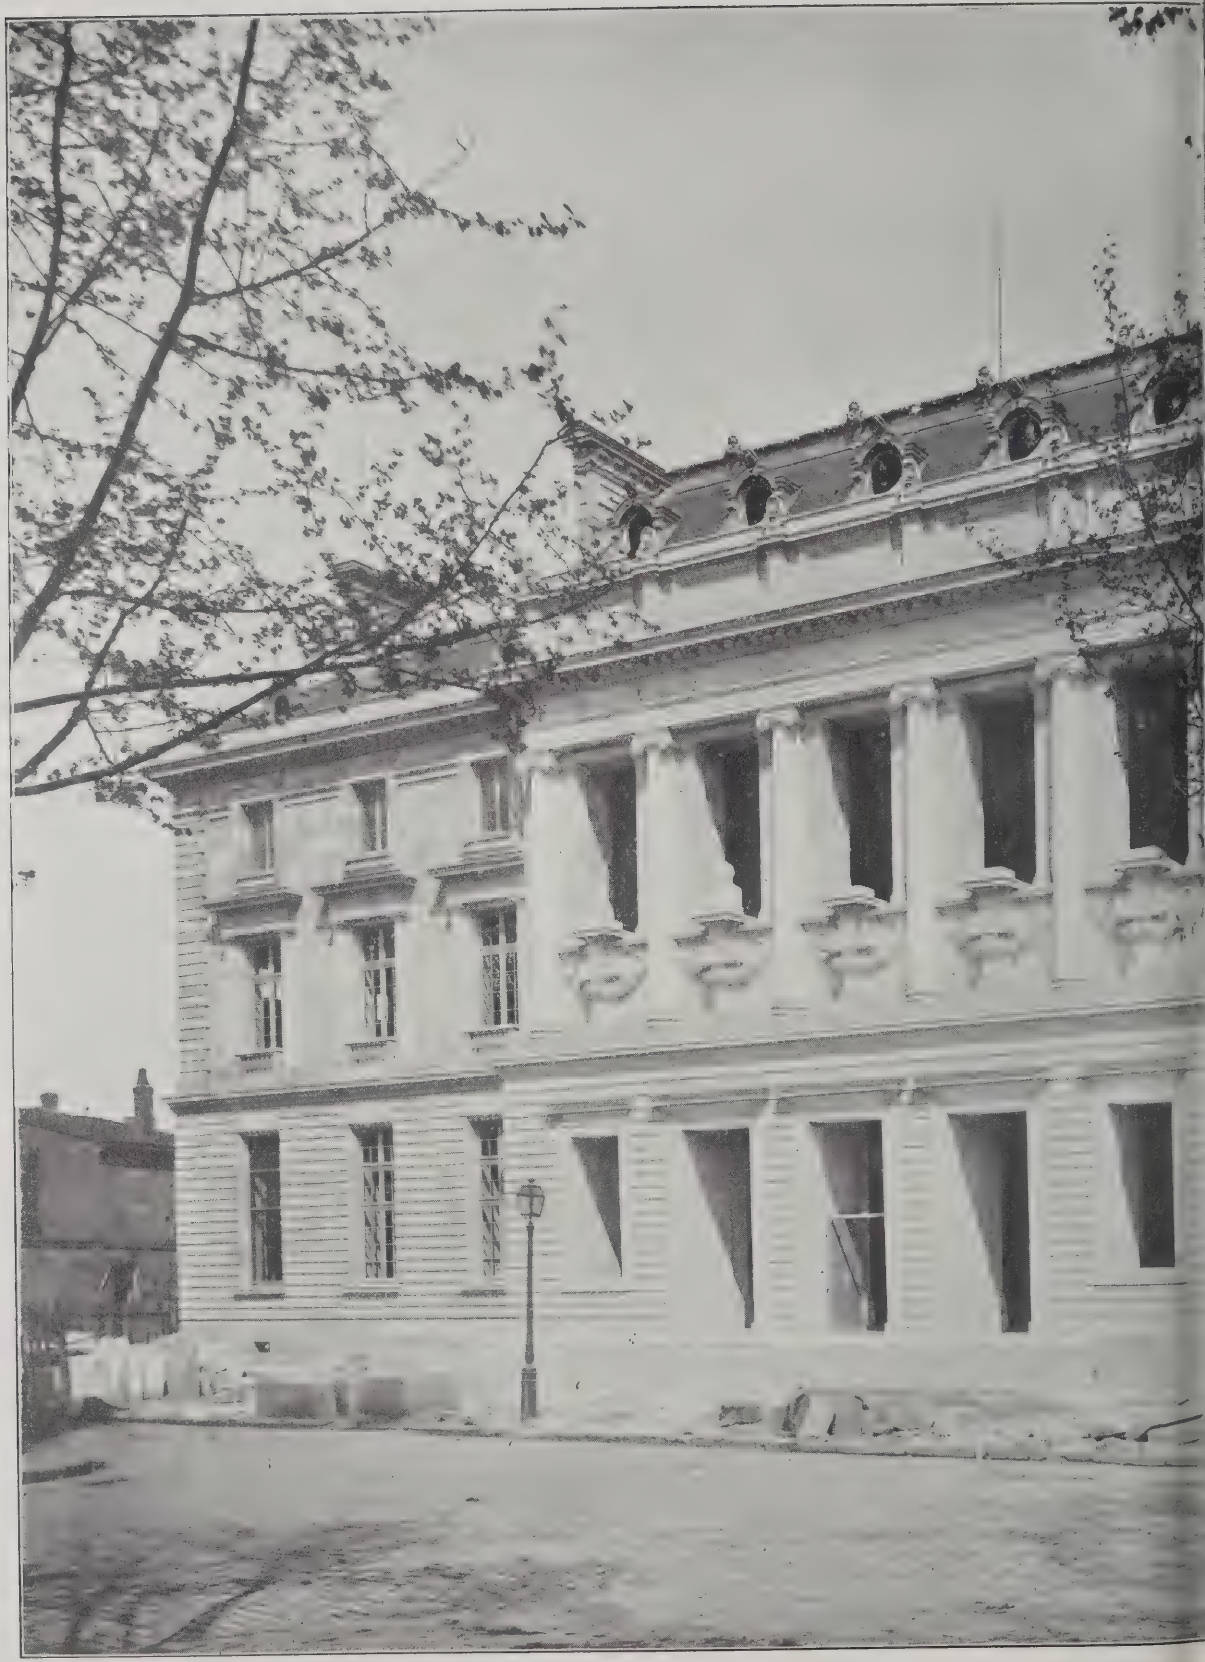
PATELEY BRIDGE.—Proposals have been made for the erection of a public abattoir here at a cost of about £800.

Notes on Competitions.

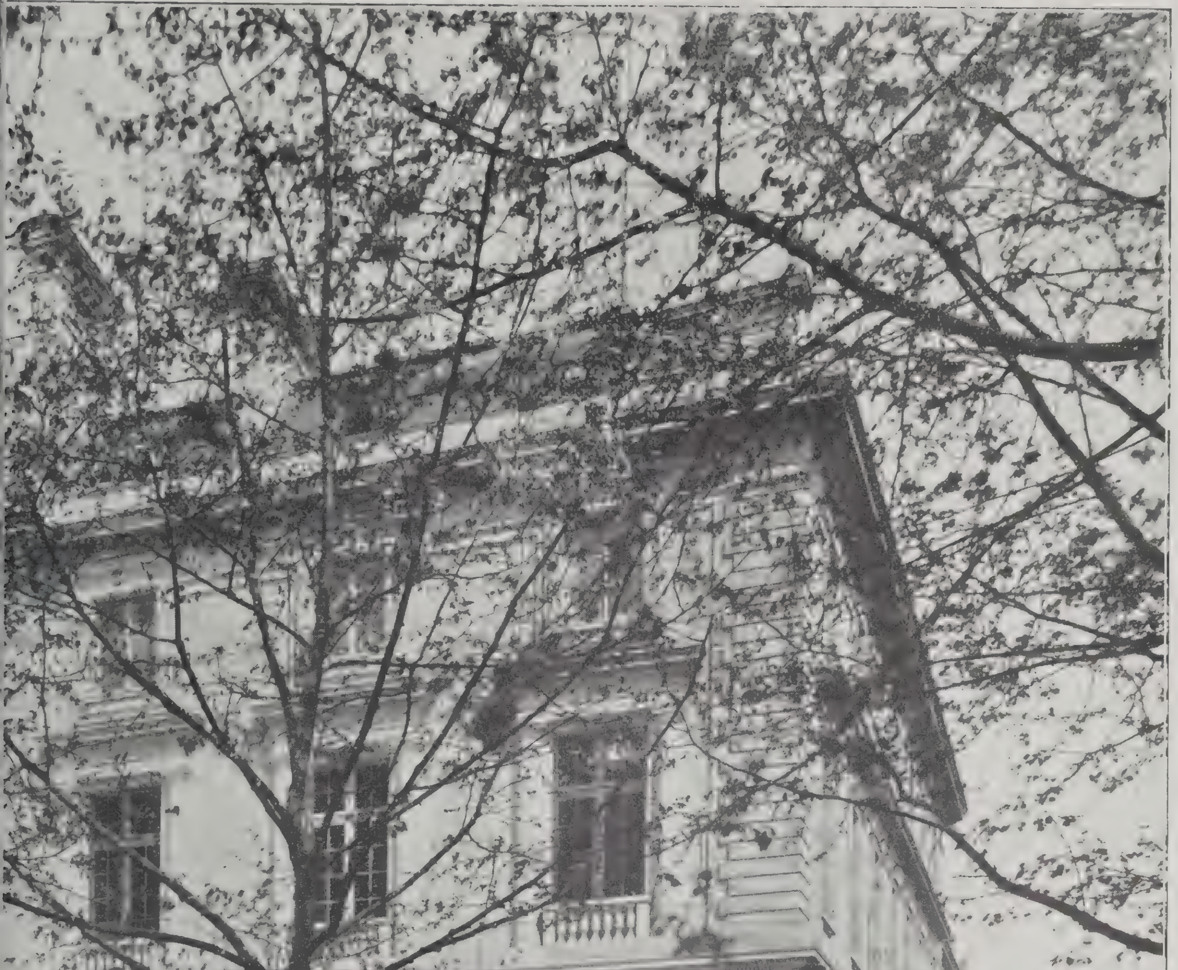
LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Dec. 1.	TRALEE. CARNEGIE LIBRARY AND TECHNICAL SCHOOL. Cost not to exceed £4,500. Premiums of £20 and £10 for design placed first and second by the assessor. Copies of instructions and conditions from the Town Clerk, Tralee.
Dec. 1.	PUBLIC PARK PLAN, BANGOR (COUNTY DOWN). The U.D. Council offer a premium of £30 for the best scheme for laying out a public park, twenty acres in extent. Premium to include all expenses of successful competitor, whose designs become the property of the Council. Schemes to J. Middleton, Town Clerk, Town Hall, Bangor, County Down.
Dec. 3.	PRINCE HENRY'S GRAMMAR SCHOOL, OTLEY. New buildings in Farnley Lane, Otley. If the number of applications to compete is excessive it is intended by selection to invite 20 or 25 architects only to compete. A fully-qualified non-competing architect, in conjunction with the West Riding Education Committee's Inspector of Secondary Schools, will assist the Governors in adjudicating upon the plans. Applications, stating qualifications and experience, must be received by Ernest S. Mead, Clerk to the Governors, East View, Otley, before the date named.
Dec. 11.	MINEHEAD. SHELTER, with cloakroom and lavatories, on the Beach, the whole expense of which is not to exceed £3.000. Premium of £20. Plan of site and conditions from L. C. Webber-Incledon Clerk to U.D. Council, 16, Park Street, Minehead, Somerset.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan. 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3,600, Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Clearkkin, Secretary, Technical In-Instruction Committee, Larne.
1910. Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.



COLLEGE OF MEDICINE AND PHARMACY, BO



JX. JEAN-LOUIS PASCAL, ARCHITECT.

Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
No Date.	CRADLEY HEATH. The trustees of the United Methodist Church invite Architects to submit designs on approval for Sunday School with seating accommodation for about 1,000. For particulars, Mr. C. Clee, Cradley Heath, Staffs.

Institution of Civil Engineers' Building.

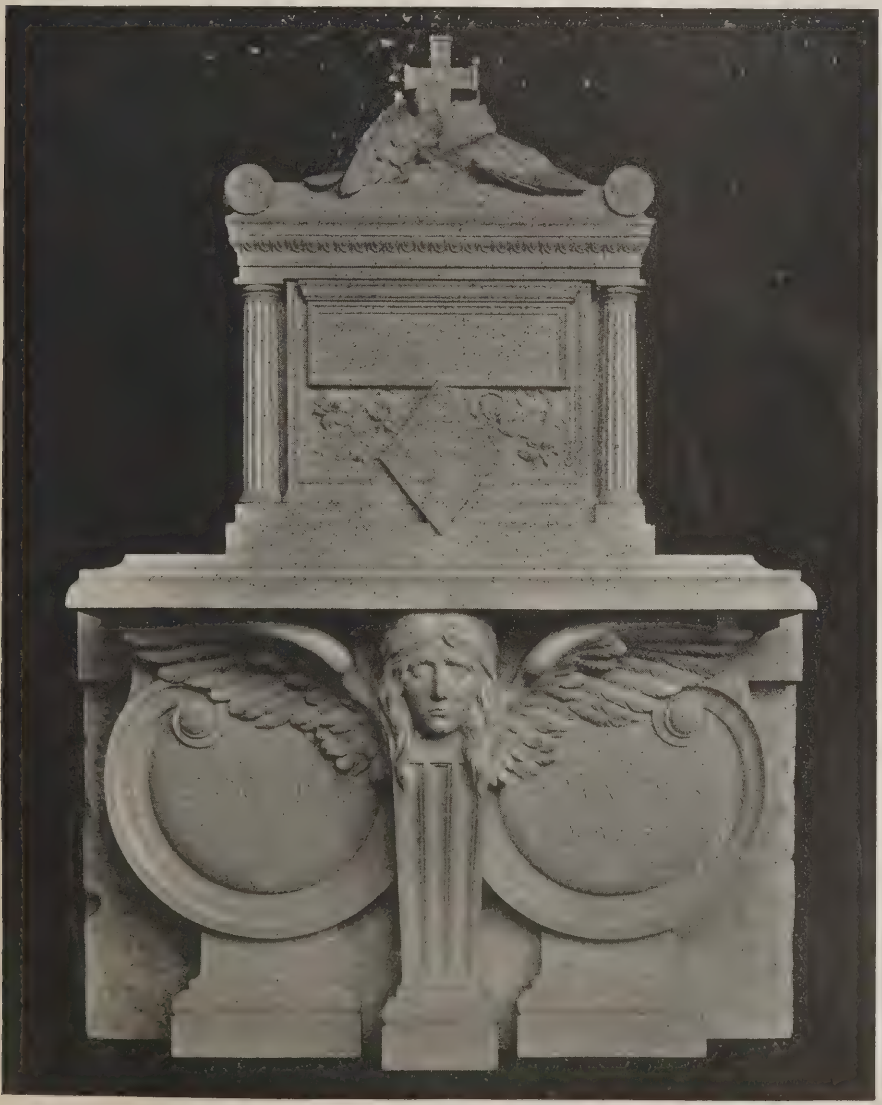
Arrangements have now been made with H.M. Office of Works for the acquisition of a new site for the above building, which will be proceeded with early next year. The Council have invited competitive designs for the new premises from six architects.

The Welsh National War Memorial at Cardiff, which has been unveiled by General Sir John French, is now nearing completion. It stands on a fine site in the main avenue of Cathays Park. It is by Mr. Albert Toft, and is the result of a competition, in which Mr. Toft was the successful sculptor. The memorial, which stands about 25ft. high, is in the Italian Renaissance style, and the meterials used are Portland stone and granite with bronze statues.

THE ARCHITECTURAL ASSOCIATION.

Annual Conversazione.

The conversazione was held last Wednesday evening at Tufton Street, and proved more than ordinarily successful. The Octagon Hall had been prettily decorated for the occasion, and some changes had been made in the arrangements; the refreshments being served on the ground floor, and the classrooms on the first floor being thrown into one, forming a crush hall. Round this were hung an excellent collection of water-colour drawings. The visitors, who must have numbered some hundreds, prevented more than a cursory glance at these, but we noticed some by Mr. Douglas Robinson, Mr. Ernest George, Mr. Leslie Wilkinson, Mr. Mervyn Macartney, and others. A collection of drawings by the late Mr. Fulleylove, lent by Mrs. Fulleylove, were of great interest, and the City Corporation lent some fine drawings of old and new London Bridge, by E. W. Cooke. Among other fine water-colours was one of Burges' scheme for decorating St. Paul's, from the brush of Mr. Axel Haig. The galleries were hung with specimens of students' work, and there was some very excellent work among it. The president, Mr. Henry Tanner, received the guests on the first gallery at the top of the stairs. Among them we noticed Mr. Ernest George, Sir A. Brumwell Thomas, Mr. Walter Cave, Mr. Leonard Stokes, Mr. R. S. Balfour, Mr. G. H. Fellowes Prynne, Mr. H. Seth-Smith, Mr. R. Phené Spiers, Mr. F. Dare Clapham, Mr. C. Wontner Smith, Mr. Maurice Webb, Mr. Edwin Gunn, Mr. W. E. Davis, Mr. T. L. Dale, Mr. T. Frank Green, Mr. H. P. G. Maule, Mr. J. Buyers Scott, and many others. Pitman's Blue Viennese Orchestra played in the Octagon, and the A.A. Musical and Dramatic Society supplied part songs and quartettes.



MONUMENT TO THE LITTLE GIRLS WHO PERISHED IN THE FIRE AT THE BAZAAR DE CHARITE, PARIS. J.-L. PASCAL, ARCHITECT.

Correspondence.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

Quantities and Contracts.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I thank you for your article in your issue of Wednesday last dealing with "Builders' Quantities." To those of us who are engaged in the strenuous struggle for existence, against competition of all sorts—keen, illegitimate, and corrupt—your article was very refreshing. The position of the average builder is too precarious for him to engage in open warfare with the architectural profession; and unless his case can be understood and stated by one occupying neutral ground his wrongs will remain unredressed.

We are too often tricked out of common rights by ingeniously contrived contracts, which we are urged to sign because "they are always signed by other builders," and because "they have no meaning in practice," but which we know to be terrible engines of oppression when brought into action. Even our much vaunted agreement compiled by the R.I.B.A. and the National Federation is open to gross misuse.

But my purpose is to thank you very warmly for the courageous and impartial attitude you so consistently have followed towards the builders.

To you, as far as I know, belongs the honour of being the first editor of a journal devoted to architecture to plead for equity in building contracts. You have so far done this with commendable clearness, force, and conviction. With such able assistance, some of the shadows that have haunted builders for over two generations may yet be removed.

"CONTRACTOR."

AN OPENING IN VANCOUVER.

A subscriber who is in practice as an architect in Vancouver desires to obtain an assistant who is a thoroughly competent draughtsman, and a good all-round man, and he intimates that the appointment might ultimately lead to a partnership. It will be seen from our advertising columns that application is to be made in the first instance to the editor of this journal, who, while accepting no responsibility in the matter, is willing to oblige a Vancouver subscriber by conducting the necessary preliminaries. The advertisement appears on page xxii.

ROME'S NEW PALACE OF JUSTICE.

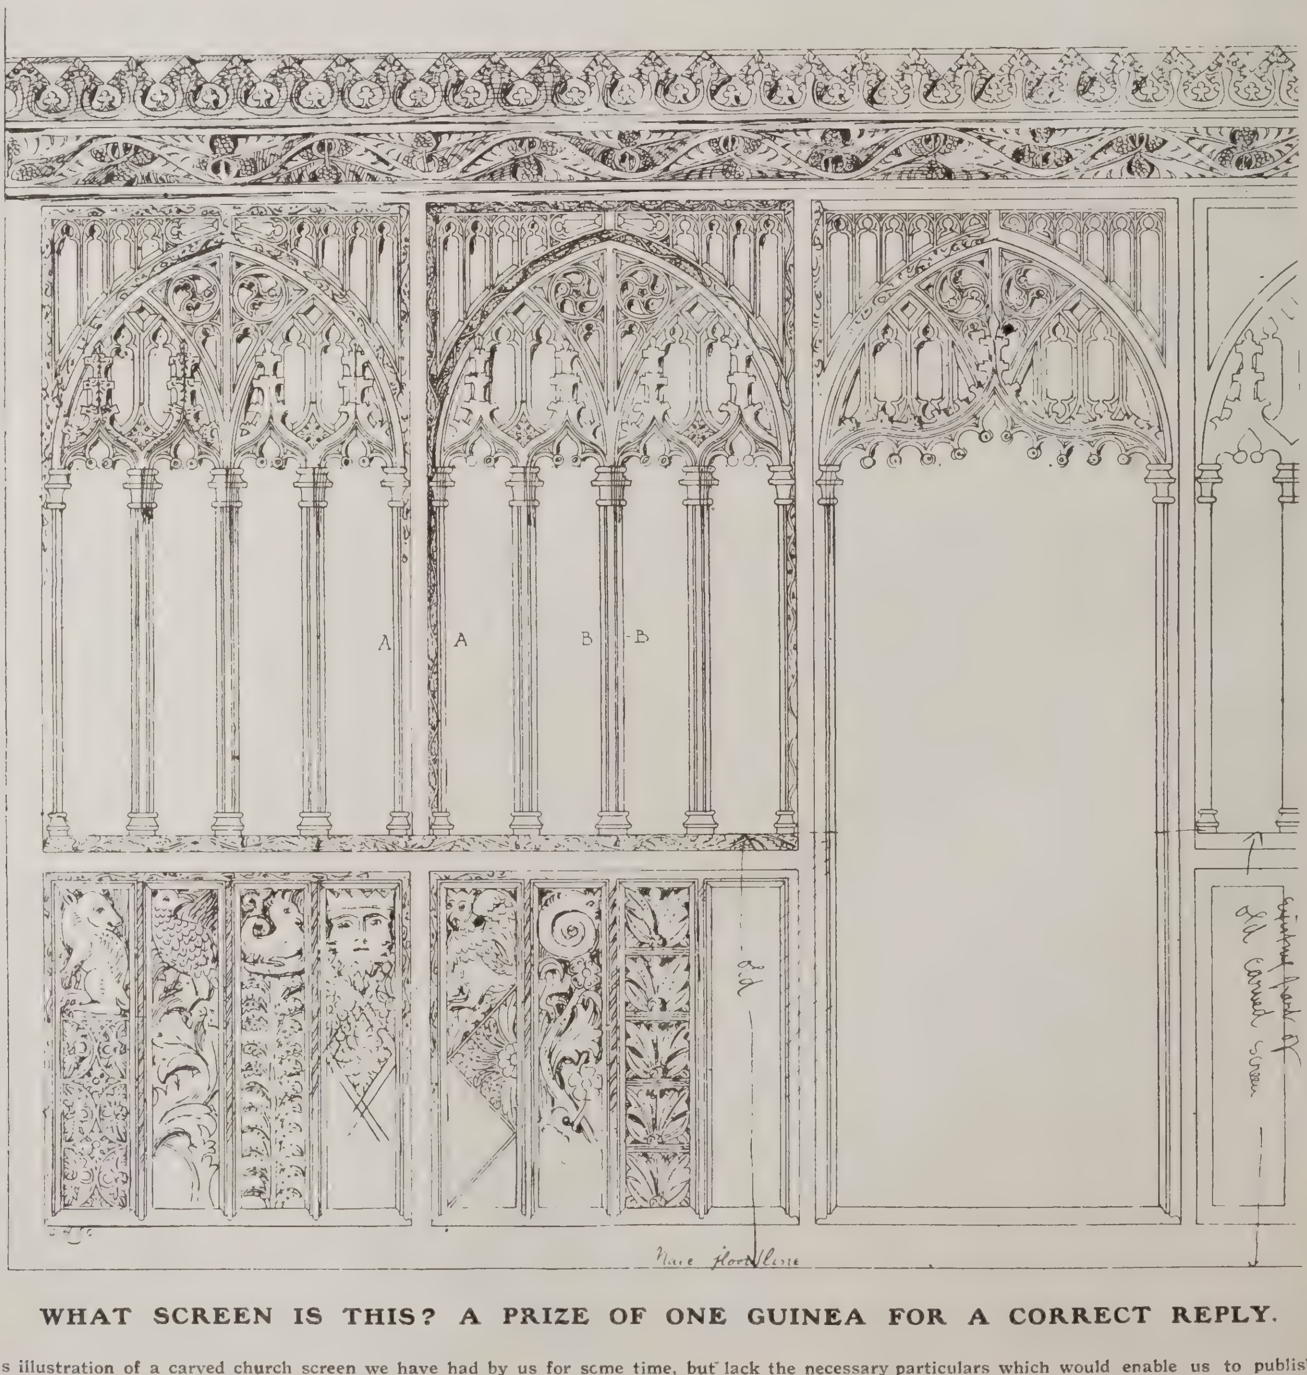
The new Palace of Justice, after 20 years, is still unfinished. This structure, comments the Rome correspondent of the "Times," is typical of the slow, and not always fortunate, growth of the capital of Italy. Begun in 1889, at a period of some financial depression, its original cost was determined at £200,000, a sum which was almost at once raised to £1,040,000 by a special commission who apparently thought economy misplaced in the case of so important an edifice. Even so the contracts threatened to outrun the estimates, and a second commission, in 1892, raised the total cost to £1,480,000.

This summer Signor Bertolini, Minister of Public Works, informed the country that £1,534,840 had been expended upon a building not yet fully completed. It will have cost, therefore, before it is occupied, more than three times as much as the London Law Courts, and it is doubtful whether it will ever be the scene of one-third of the business which is transacted in them. It is further complained that the accommodation is insufficient and most inconveniently planned. So much space has been given to interior magnificence, to vast and endless corridors, to huge staircases, to inner halls and courtyards, that little room is left for the actual Courts and the adjoining chambers.

On the exterior of the Palace of Justice there is no need here to make any criticism. The building covers about eight acres. It is of the heavily ornate style which seems to be much followed in modern Italy. Almost every form of ornamentation has found a place somewhere on its massive walls; heads of oxen, heads of Minerva, wreaths, medallions, coats-of-arms, coats of mail, Greek designs, Renaissance scrolls, nothing seems to be wanting. There cannot in all that vast surface be as much as a square yard of stone which is not decorated. Artists and architects may very likely differ as to the æsthetic effect. The wonder, however, still remains as to how it came to cost so much money, a question only partly answered by the fact that, for some unknown reasons, the stone was all brought from Brescia. Signor Luzzatti, writing some time ago in the "Corriere della Sera," compared the history of the Palace of Justice with that of the Imprimerie Nationale in Paris, and attributed the disasters of both to much the same causes—first, the unwillingness of Governments to make a full confession to the public of their real, or more probable, cost when Parliamentary sanction is first asked for public works; secondly, the tendency of contracts, when once their original limit has been exceeded, to increase enormously on the side of expenditure; thirdly, the unsatisfactory control exercised by Ministers who succeed to half-finished works without succeeding to the responsibility for them. What will be the ultimate cost of the huge monument that is slowly rising to the memory of Victor Emmanuel it would be difficult to estimate. But in the case of the monument there was naturally no question of utility or economy, whereas in the case of the Palace of Justice there should have been question of nothing else.

WHITGIFT HOSPITAL SAVED.

A statutory special meeting of the Croydon Borough Council, required in connection with the promotion of a Bill in Parliament for powers to widen North End under the scheme which threatens Whitgift Hospital with demolition, was held on November 27th. Letters opposing the scheme were sent by the Woolwich Antiquarian Society, the Surrey Archæological Society, and Canon Bromfield, who enclosed a resolution of the clergy of the rural deanery of Lambeth. The opponents of the proposal urged that apart from sentiment the town could not afford the enormous expenditure in the present depreciated condition of local property, and that the widening, even if shown necessary, could be accomplished by an alternative scheme leaving the hospital intact. They also declared that the representations of Church authorities and scientific societies in the Committee Room of the House of Commons—should proceedings get so far—would overwhelm the Council and mean a great waste



WHAT SCREEN IS THIS? A PRIZE OF ONE GUINEA FOR A CORRECT REPLY.

This illustration of a carved church screen we have had by us for some time, but lack the necessary particulars which would enable us to publish it in the ordinary way. We have therefore decided to offer a prize of One Guinea to the *sender of the first-opened reply which correctly states, with proof, in what church it is situated.* All letters must be marked "Screen" on the left hand top corner of the envelope, and addressed to The Editor of "The Builders' Journal," Caxton House, Westminster. They will be opened in the same order as received. Letters from Country readers arriving by first post in the morning will be counted as arriving the previous day. The Editor's decision must be regarded as final and binding on all competitors.

of the Croydon ratepayers' money. Many speakers predicted the decisive defeat of the scheme in the event of a poll of the borough. Mr. J. O. Pelton, on the authority of one of its members, said that the Royal Commission on Ancient Monuments had virtually scheduled the hospital as being most worthy of preservation, and he was sure, therefore, that no Parliamentary Committee would assent to its destruction.

The supporters of the proposition alleged that the alternative scheme would cost £60,000 more, and then not wholly meet the difficulty. Alderman Barrow, the chief speaker in favour of the resolution, said that North End at this point was the same narrow width now as in 1861, and dwelt on the bad feeling caused by the vexatious delays of trams and other vehicles. Mr Stapleton, upon the same side, urged that while a great deal had been heard of the opposition of outside societies, none had definitely offered to contribute anything towards the alternative scheme for saving the hospital. On a division twenty-five voted for the scheme and twenty-nine against it. The result was received with loud applause by a large gathering of opponents of the scheme, which is, therefore, for the time being, entirely defeated, and may not be expected to appear again in the same form.

Commenting on this decision a writer in the "Evening Standard" remarks: The Croydon Borough Council are to be congratulated on their decision to spare Whitgift Hospital—even though the proposal for its destruction was only defeated by four votes. It is to be hoped that this particular scheme of "improvement" will not appear again. It is, of course, possible to exaggerate the sentiment that clings at all costs to ancient buildings, but it is a form of exaggeration which certainly does not appear too often in this country. The tendency is still far too much the other way, in spite of archæological societies and others. An eminent architect has said that there is always a feasible way of avoiding the destruction of a valuable building. What is not always present is the good will. It should not be forgotten that our store of historical buildings is a small one compared to that of countries which have not suffered so much as we have from the modern jerry-builder. Even at the cost of a little inconvenience, which can probably be overcome, we must maintain our heritage: the future generations will demand it of us.

Coming Events.

Wednesday, December 1.

Institute of Sanitary Engineers.—Mr. Richard Horton on "Petrol Air Gas Lighting," 8 p.m.

Friday, December 3.

Institution of Mechanical Engineers,—Extra meeting. Resumed discussion on Mr. H. A. Humphreys' paper: "An internal-combustion pump, and other applications of a new principle," 8 p.m.

Monday, December 6.

Liverpool Architectural Society.—Mr. C. H. B. Quennell, F.R.I.B.A., on "The Development of Suburban Estates."

Tuesday, December 7.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 10th paper, "Origin and Evolution of the Ionic Order," 4 p.m.

Institute of Sanitary Engineers.—Students' Meeting. Mr. A. J. Martin, M.Inst.C.E., on "Sewage Disposal," 7 p.m.

Wednesday, December 8.

Northern Architectural Association, Newcastle.—Council Meeting, 7 p.m. Ordinary Meeting: Mr. John W. Simpson, F.R.I.B.A., will read a paper, 7.30 p.m.

Royal Sanitary Institute, 90, Buckingham Palace Road, S.W.—Discussion on "The Collection and Disposal of House Refuse," opened by Mr. John S. Brodie, Borough Engineer, Blackpool, 8 p.m.

Manchester Society of Architects.—Mr. Henry Wilson on "Workmanship."

Friday, December 10.

Architectural Association.—Mr. F. C. Eden, on "Varallo, Orta, and Varese," 7.30 p.m.

Monday, December 13.

R.I.B.A.—Professor A. D. F. Hamlin, on "Architectural Education in America," 8 p.m.

Tuesday, December 14.

National Federation of Building Trade Employers.—Meeting of Administrative and Journal Committee.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 11th paper, "Origin and Evolution of the Corinthian Order," 4.30 p.m.

Institute of Sanitary Engineers.—Students' Meeting. Mr. Geo. W. Chilvers, M.R.San.I., on "Practical Heating and Hot Water Supply to Buildings," 7 p.m.

The Trades' Training School, of 153, Great Titchfield Street, W. Presentation of prizes at the Carpenters' Hall, London Wall, by the Duke of Argyll, K.T., etc. 8 p.m.

Monday, December 20.

Lancashire, Cheshire and North Wales Building Trades' Employers' Federation.—Half-yearly meeting at Liverpool.

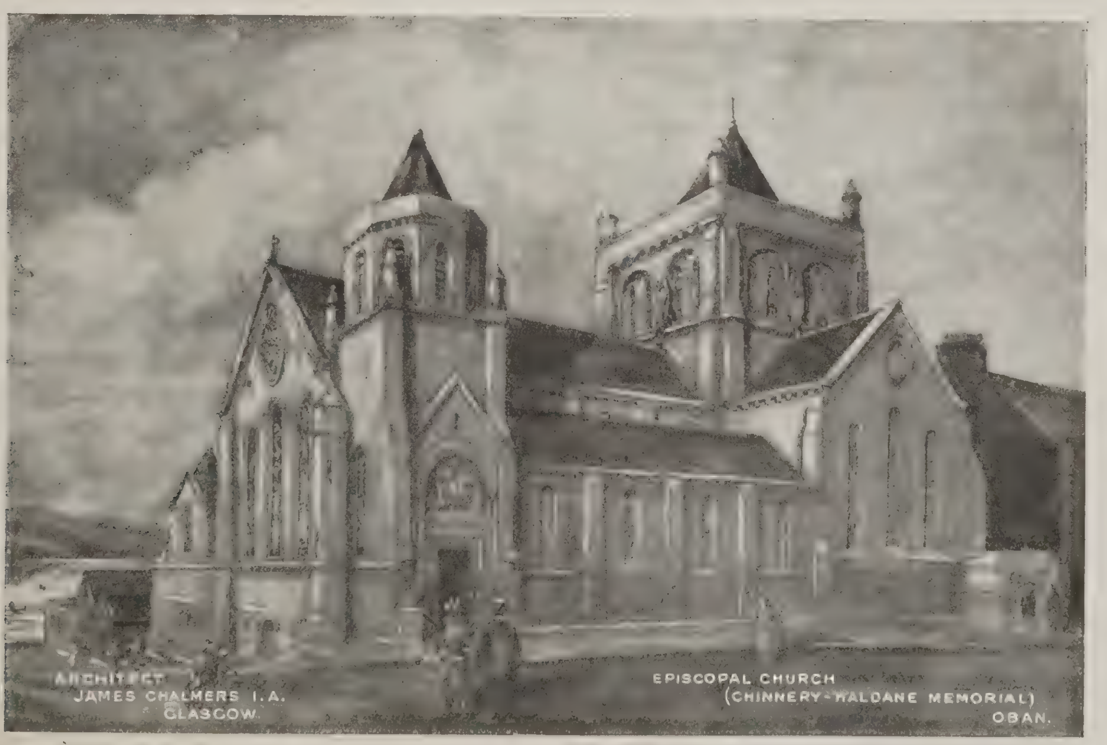
Tuesday, December 21.

Ancient Architecture Lectures at the British Museum.—Mr. Banister Fletcher's 12th paper. Seventh and concluding lecture on "Greek Architecture." End of Michaelmas term. 4.30 p.m.

Trade and Craft.

Doloment Patent Jointless Flooring.

The British Doloment Co., Ltd., Caxton House, Westminster, have forwarded for notice a revised edition of their catalogue, which is well illustrated, mainly with views of important buildings, in which Doloment has been or is being used. Doloment is laid ⅞-in. thick, in a double layer, which system enables the firm to give an absolute guarantee against cracking or bulging. It may be laid to greater thicknesses if required. Being elastic, non-absorbent, and



"Scottish Chronicle."

CHURCH OF ST. JOHN THE DIVINE, OBAN. JAMES CHALMERS, I.A., ARCHITECT.

This church, which is being erected as a memorial to the late Dr. Chinnery-Haldane, sometime Bishop of Argyll and the Isles. The main features are the octagonal baptistry, the south gable (60 ft, high), the belfry tower, the lantern tower (130 ft. high), and the transept. The stone is from St. Bee's Red-stone Quarry, Whitehaven, and the slates will be olive green. The architect is Mr. James Chalmers, I.A., of Glasgow. The contractors are as follows: for the mason work, Mr. Elphinstone Forrest, of Glasgow; joiner work, Messrs. Garvie and Son, Aberdeen; plumber work, Mr. Crawford, Oban; slater work, Mr. Jameson, Oban.

"*Scottish Chronicle.*"

CHURCH OF ST. JOHN THE DIVINE, OBAN. JAMES CHALMERS, I.A., ARCHITECT.

The interior of this church is of St. Bee's red-stone, and the barrel-vaulted roof will be of African mahogany, without staining. The architect's suggestion is that the whole east end shall be appropriated to the altar, carrying the reredos, with carved canopy more than 30 ft. high, which is in memory of the late Bishop Chinnery-Haldane.

non-inflammable, Doloment is greatly in demand for hospitals, schools, and public buildings. A long list of the buildings in which, or authorities by whom, the material has been specified includes Government Departments and Corporations, hospitals, and infirmaries, libraries and schools, banks, clubs, and hotels, industrial works, etc. There are also imposing lists of eminent architects who have specified, and of important building firms that have employed Doloment, as well as some most convincing testimonials as to its merits. It is applied to floors and walls without a single join, and can be finished in many colours and designs, to imitate granite, mosaic, or marble.

The "Cable" System of Heating.

Before deciding upon the method of heating large buildings, architects should obtain schemes on the Cable system (low-pressure hot water). This system will save excavating heating chambers, ducts and channels. The pipes may be carried in any direction absolutely independent of levels, and are considerably smaller than any other system. Messrs. J. F. Phillips and Son, of 21, Old Queen Street, Westminster, S.W., and of Brighton and Liverpool, who are the licensees for the Cable system, have in hand the following installations, viz.: Westmeston Place, Hassocks, the residence of Colonel Money; Sandhills, Sletchingley, Surrey, the residence of Captain Walsh; Royal Portsmouth Hospital, Nurses' Home, this being the second installation on the system at this hospital; Messrs. Pratt Bros., extensive premises, High Road, Streatham; St. Luke's Church, Battersea; Orchard Street Schools, Chichester, etc. The system is specially advantageous in hospitals, asylums, schools, public buildings and large private mansions.

Federation News.

BIRMINGHAM ASSOCIATION.

Secretary: G. Henry Wright.

The annual meeting of the Birmingham Building Trades Employers' Association was held at the Grand Hotel on November 11th. Mr. F. G. Whittall presided.

In the annual report, the committee recorded with regret the fact that, in common with most industries in the city, the building trade during the past year had been in a very depressed condition, and there was at the present time no sign of a revival. As a result of notices served on the operatives, uniformity of working hours in all trades had been secured. As a result of the adoption of the inter-trading rule, there had been a large increase in the membership, which now was 140, against 84 at the end of last year. The committee also reported with regret that Mr. E. J. Bigwood, who had been their secretary for twenty-five years, had found it necessary to resign his office, owing to increasing pressure of other business. He left the work of the association with the abiding goodwill and wishes of all its members for his future welfare. The balance-sheet showed the ordinary receipts for the year had been £241 19s. 10d., which, with the balance from last year, made a total of £268 0s. 5d. The various disbursements had been £222 16s. 11d., leaving a balance in hand of £45 3s. 6d.

Mr. F. G. Whittall, in proposing the adoption of the report, said he had a feeling that in their deplorable experience of bad trade they had at last touched bottom, and he hoped they would next year have to record not only a very satisfactory improvement, but a boom. The year was notable as having seen the achievement of a uniform set of working rules among all the operatives in the trade, particularly with reference to starting and leaving off work. The difficulties had been overcome by the conciliatory attitude of all parties to the arrangement. The masters had secured the uniformity they wanted, while the operatives had attained their end of shorter hours of work. He announced the council had appointed as secretary Mr. G. Henry Wright, of the Chamber of Commerce. The report was adopted.

The following officers were elected:—President, Mr. Ralph Webb; senior vice-president, Mr. W. Moffat; junior vice-president, Mr. G. Elvins; treasurer, Mr. George Twigg.

At the close of the meeting, Mr. Whittall presented to Mr. Bigwood a handsome mahogany-cased chiming clock in recognition of his devoted services to the association during twenty-five years. Mr. A. S. Smith handed to Mr. Bigwood a decorated address recording the members' high appreciation of his assistance to the association.

Mr. Ralph Webb presided at the annual dinner of the association held at the Grand Hotel on November 11th. There was a large gathering, those present including the Lord Mayor (Councillor Bowater), Mr. W. Moffat, Mr. A. S. Dixon (president Birmingham Architectural Association), Mr. John L. Williams, Mr. F. G. Whittall, Mr. Ernest J. Brown (president National Federation), Mr. H. Smith (president Midland Federation), and Mr. G. Elvins.

The toast of "Success to the Birmingham Building Trades Employers' Association and the trade of the city" was proposed by the Lord Mayor, who said that no industry had felt the depression in trade more acutely than had the building and allied trades, but they were not met that night at the funeral of the trade. That and other trades had previously experienced periods of depression and had emerged from them. The builders had, he noticed, admitted into their association members of the allied trades. That would strengthen the foundations of the society, but it must also be a great advantage to the subsidiary trades. He observed that whenever the City Council accepted a tender from a firm outside Birmingham there was always a great outcry, but if it were the custom of all local authorities to confine their work to local men, it would be to the very great loss of so splendidly developed a trade as the building trade of Birmingham, for the local builders obtained more work outside the city than the outside men obtained in Birmingham. Some of them might regret that a Birmingham firm had not obtained the contract for the Council House extension, but an outsider tendered lower than any firm in the city, and in all fairness the Council had to accept the lowest contract.

The President (Mr. R. Webb), who responded to the toast, was sorry that they could not report any improvement in the building trade in any part of the country. Their trade was the first to feel any depression, and the last to feel the benefit of any improvement in trade generally. Builders made matters worse for themselves by the insane cutting of prices. At present work was being taken at rates which could not leave any margin of profit, and, in fact, must entail serious loss. The men in most branches of the trade were again "on the rampage," for they had given notices partly for an increase in wages and partly for alterations in working rules, so he supposed the trade would again experience a troublous time for a few months.

Mr. W. Moffat, who proposed "The Architects and Surveyors," expressed regret that the contract for the Council House extension had gone out of the city.

The toast was responded to by Mr. A. S. Dixon and Mr. J. L. Williams. Mr. F. G.

Whittall proposed, and Messrs. E. J. Brown and H. Smith replied to, the toast of "Kindred Associations," and the health of "The Visitors" was proposed by Mr. G. Elvins.

LONDON MASTER BUILDERS' ASSOCIATION.

Secretary: T. Costigan.

The ordinary monthly council meeting of the London Master Builders' Association was held on Thursday, November 18th, when the president (Mr. F. G. Rice) occupied the chair.

The meeting was of a lengthy and discursive character, and was protracted till quite a late hour.

After reading the minutes of the ordinary Council meeting held on October 21st, and of the special Council meeting on November 4th, the Council proceeded to consider a long and important agenda.

The question of a builder who is appealing against the decision of an arbitrator was considered. The opinion of counsel was read, and a certain course of action decided upon.

On the report of the proceedings of the Organisation Committee, a long discussion took place as to the eligibility of sub-contractors for associate membership, the same firm frequently trading both as builders' merchants and as sub-contractors, specified by architects, and therefore exposed to the same attacks as the master builder himself. Under such circumstances, it was considered hardly fair for the builder to have to do all the fighting in the event of a trade dispute, while the sub-contractor could stand aloof and even extend his operations.

It was proposed by some that those who are likely to compete with the builder should give an undertaking to take the same chance as he does, and support him in case of need. It is well known, they said, how much disorganisation is caused by some sub-contractors. They treat the builder as of no account, use his plant, and, indeed, ride roughshod over him, while the enduring builder has to bear all his annoyances without satisfaction to his general operations, and with little or no profit.

After remarks by Messrs. F. Higgs, J. Carmichael, Wr. Laurence, jun., Ernest J. Brown, W. F. Wallis, Frank May, Col. G. Howard Trollope, and F. L. Dove, the Council agreed that those firms who are specified by architects to carry out work usually done by the building contractor, be considered sub-contractors.

One firm was elected as ordinary member —Messrs. R. Woollaston and Co., Limehouse—and 68 were elected as associate members.

The president produced his draft of the addition to the History of the Association, to be given in the 1910 "Diary and Handbook," and the Council approved it.

The question of a trade paper being issued free to every ordinary member of the Association was considered and referred to the Finance Committee for report.

WIGAN AND DISTRICT ASSOCIATION:

Secretary: Robert Hollows, A.C.A.

The annual meeting of the Wigan Association was held on Thursday, November 18th, at the Clarence Hotel, Wallgate, Wigan. Mr. William Webster (Messrs. Webster and Winstanley) presided over a good attendence of members.

The secretary (Mr. Robert Hollows) read the report for the past year, which recorded that at the commencement of the financial year an endeavour was made to come to some arrangement with the Operative Painters' Society respecting workmen on country jobs catching the early trains, but the matter fell through, the operatives' society not agreeing to our suggestions. This matter, however, has been dealt with in the notice of alterations to working rules, sent by this association to their society recently.

Cases of infringement of association rule 14 (non-members) were reported during the year numbering 3, which were dealt with by the Executive Committee. One member has been expelled from membership of the Association for non-compliance with the requisitions of the Executive Committee, and another firm has been expelled from membership for infringing rule 14.

Notice of alterations to the working rules of the Operative Carpenters and Joiners were received in October, 1908, and, after many meetings, new rules were drawn up and agreed upon, which came into operation on May 1st, 1909.

On May 23rd last, a dispute arose with the Operative Joiners' Society respecting the construction that should be placed on the working rules respecting the time that men working on outside jobs should be at the shop, some of the operatives ceasing work at such times as would enable them to be at the pay table at 12 noon on Saturdays, and the employers had rightly deducted a proportionate amount of wage. Meetings were held with their deputation on June 10th and 17th. At the general meeting of master joiners, held July 7th, it was agreed to refer the matter to arbitration, and after five weeks' wavering, during which the employers had to take the same stringent steps, the operatives' society agreed to lay the same before Mr. Henry Brierley, county court registrar, as umpire.

The arbitration was held on August 31st last, and the award came to hand on September 16th, when the matter went in favour of the employers. In his decision, Mr. Brierley had the concurrence of his Honour Judge Bradbury.

During the year forty-three meetings had been held, of which 12 have been executive meetings.

Two meetings have been held at Hindley to which the members of the trade were invited, and matters particularly affecting them were discussed, and the benefits to be derived from being members of an Association of this description were laid before them. Several persons joined, and it is hoped that more will follow, when more effective methods can be adopted to ensure fairer treatment to the employers in that district.

There have been notices of alterations of working rules sent in to the Operative Plumbers' and Operative Painters' Societies, and one has been received from the Operative Joiners' Society, to which a counter notice has been given.

The statement of accounts for thc past year were submitted by the treasurer, Mr. Oswald Pilling (Messrs Joseph Wilson and Co.), which were considered highly satisfactory, and were unanimously adopted.

The balance at the credit of revenue account, after taking into account the sum of £150 invested in Wigan Corporation stock, was £252 odd, and it has been decided to invest a further £100 in the same stock.

The following persons were elected officers for the ensuing year:—President, Mr. John Smith; vice-president, Mr. Oswald Pilling; treasurer, Mr. Robert G. Dawson; auditors, Messrs. Glover and Dickinson.

The matter of the "Builders' Journal" was brought before the meeting and fully explained, and its value as a business paper laid before the members. The arrangements in regard thereto, made by other associations and their members were also mentioned. After discussion, it was resolved that the matter be left to the discretion of each member.

The annual dinner was fixed for Tuesday, December 7th, and a sub-committee was appointed to make the necessary arrangements. In regard to the notice of alteration to working rules, received from the Operative Carpenters' and Joiners Society (particulars of which were reported in the "Builders' Journal," of November 17th), a counter notice has been forwarded, which embodies the following alterations in the present rules:—Working hours in summer months increased from 49½ to 54½, and in the winter months reduced form 44 to 41½ per week. Rate of wages decreased from 9d. per hour to 8½d. all the year round. A variation has been made in the rate of overtime pay, and the times of commencement of such overtime rates, and the following additions have been demanded: "Where wages are paid on the job, the workmen shall continue work until the leaving off times as per rules both on country and outside jobs. If wages are not paid on the job, men working within a mile and a half from the shop shall work until the leaving off times as stated in the rules, and then proceed to the shop for their wages. The "Boundary" in the starting time rule has been increased from one mile to a mile and a half, and the clause relating to protection from the weather, when working in a building with artificial light, has been eliminated. The rule relating to the outside jobs has been eliminated. This rule allows a workman on outside work (within a mile and a half from the shop) to resume work, should the weather prove inclement.

The "country jobs" rule has been amended as follows:—The workmen on these jobs are to work on Saturdays up to 12 noon, and not up to such times as will allow of their being at the shop at that time. The present rule relating to the "Discharge of Men," has been eliminated, and the corresponding rule of the Bury Association has been added. The new rule reads as follows:—"That each employer, previous to discharging a workman, shall give him one hour's notice, or in default shall pay him one hour's wage; any workman leaving his employment shall give similar notice or forfeit similar wage. This rule to apply only to workmen who have been employed at least one full working week before notice is given, and shall not apply in case of neglect, incompetence, or dishonesty. This notice is for enabling a workman to get his tools in order, and must be devoted to that purpose, otherwise he must continue work until expiration of notice." The rule stating that the employer shall provide hot water for meals and lock-up places for tools, has been eliminated, and that relating to the authority of employers has been strengthened by eliminating the word "not infringing the individual liberty of the workman."

The clause peculiar to the Wigan rules, relating to no ready-made or imported woodwork in the shape of windows, doors, and other framework, being allowed to be fixed by the operatives unless the same be prepared by the contractor himself, or at least within five miles of the Wigan Market Place, has been eliminated. The present rules also allow a workman to do work at night for outside parties, if he does not do the same "systematically," but in the counter notice the word "systematically" has been eliminated, which will exclude workmen from doing work for outside parties in their own time.

The present rules contain a clause limiting apprentices to one boy to every two workmen. This limitation was included in the rules for the first time last May. The counter-notice now demands no limitation whatever.

The Conciliation rule has been amplified by adding the following, in the event of the Board not agreeing at the conference:—"failing which, it shall be referred to the judge at the Wigan County Court, or any person he may appoint, whose decision shall be final and binding." The arbitration rule has been amended, in that an arbitrator may be called upon to settle the matter by February 22nd, instead of March 22nd, and his award must be received by March 22nd, instead of April 22nd, the new rules to come into force on May 1st next ensuing.

Yorkshire Federation.

The monthly meeting of the Executive Council of the Yorkshire Federation was held at the Great Bull Hotel, Wakefield, on Thursday, November 18th. Mr. W. R. Thompson (president) occupied the chair, and was supported by 42 delegates from the affiliated associations.

The minutes of last meeting were read and approved. Apologies for absence were reported from the Right Hon. the Lord Mayor of York (Alderman J. Birch), Alderman W. H. Jessop, J.P., and Councillor J. W. Mallinson (Huddersfield), and Mr. G. E. Powell (Sheffield).

The President reported that a letter of sympathy and condolence had been forwarded to Mr. James Storrs, J.P., of Stalybridge, conveying an expression of the deep regret and sincere sympathy of the members of the Federation with him and his family in the loss which they had sustained in the sudden and sad death of his brother.

The treasurer reported receipt of the following amounts since the last meeting:—Reserved fund, £27 10s.; subscriptions, £19 10s. 6d.; transfer from insurance account, £24 16s. 1d; total, £71 16s. 7d. The Finance Committee reported that they had examined the accounts and recommended payment. It was resolved, on the motion of Mr. W. T. Ledgard, seconded by Mr. A. J. Forsdike, that the following accounts, having been examined and certified as correct, be approved, and that cheques be drawn in payment thereof, as follows:—National Federation, balance of subscription, £55 6s. 8d.; National Federation, reserve fund on account, £142 2s. 6d.; delegates' travelling expenses, £19 15s.; secretary's account for quarter, £21 18s. 10d.; total £239 3s.

The Finance Committee reported that arrangements had been made for the joint tenancy by the Federation, the Leeds M.B.A., and secretary, of offices in West Bar Chambers, Boar Lane, Leeds, within two minutes' walk of the Midland station. On the motion of Mr. A. J. Forsdike, seconded by Councillor W. G. England, J.P., the action of the Finance and Emergency Committee was approved and confirmed; and they were authorised to arrange with the Leeds Association as to apportionment of increased cost, and report.

The Finance Committee reported that they had considered the expediency of discontinuing the issue of duplicated copies of the monthly proceedings of the Federation, in view of the full reports which were now issued in the "Builders' Journal." On the motion of Mr. P. Rhodes, seconded by Mr. A. J. Forsdike, it was resolved, in view of the possibility of important matters being considered by the Federation, and the inexpediency of the discussion and decision being publicly circulated, that the issue of duplicated copies of the minutes be continued for the present.

The observations of the Wakefield, Dewsbury, Hull, and York Associations, on the sub-contract form recently submitted to local associations, were read and considered. On the motion of Mr. P. Rhodes, seconded by Mr. E. Quibell, the observations were referred to the Finance and Emergency Committee for consideration and report.

It was reported that the Federation secretary had been favoured with an interview with the architect and trustees in reference to a dispute with a Dewsbury member. The extras claimed amounted to £37 6s. 3d. The architect only allowed in his final certificate £10 16s. 6d., leaving a balance of £26 9s. 9d. As a result of the representations of the joiner and Federation, it was mutually agreed to close the matter by payment of a further sum of £17 4s. The architect stated that the reason for his not including a larger sum in the final certificate was that the extras had been charged above contract price. The attention of the trustees had been particularly drawn to the total inadequacy of this reason, as the amount certified only represented 29 per cent. of the joiner's claim.

Attention was again drawn to the absolute necessity of the strict compliance of members with the Federation's request that the adoption of the National form of contract should be urged in all cases, and not to sign any contract by which the member guarantees the accuracy of the quantities, and which does not contain at the least an independent arbitration clause.

It was reported that the National Federation were considering the expediency of some standard conditions under which tenders should be sent in, and invited the suggestions of the Federation. The matter was discussed and several points were raised. On the motion of Mr. P. Rhodes, seconded by Councillor W. G. England, J.P., it was resolved that the points now suggested be submitted to the National Federation for their consideration.

The notices of the operative societies for amendment of the conciliation rules were presented. Local associations were requested, on the motion of Mr. E. Quibell, seconded by Mr. A. J. Forsdike, to take the notices into careful consideration, and favour the Federation with their observations at the earliest possible date, with a view to the matter being considered by the Finance and Emergency Committee.

It was reported that a meeting of the National Administrative Committee would be held in London, on Tuesday, December 14th, at 2.30 p.m. On the motion of Mr. J. Dawson, seconded by Mr. G. Rayner, it was resolved to request the National Administrative Committee to consider:—(a) the expediency of discussion at the National meetings on matters of considerable trade importance, such as Labour Exchanges, Unemployment Insurance, etc.; (b) the appointment of permanent official medical referees to examine cases which arise under the Workmen's Compensation Act, and whose decisions on physical capacity shall be final; (c) representations being made to the medical societies to obtain the use of simple language on medical certificates.

Attention was drawn to the fact that it would probably soon be the turn of the Yorkshire Federation to have a representative appointed as junior auditor for the National Federation. On the motion of Mr. A. J. Forsdike, seconded by Mr. J. Biggin, the President was requested to obtain an expression of opinion from the National Administrative Committee as to when it is likely that Yorkshire will have the opportunity of being honoured with a representative being appointed as junior auditor; and the committee be informed, when it is open to a Yorkshire representative, that the Federation strongly and unanimously submits the name and urges the claims of Mr. A. W. Sinclair, of Scarborough, for such position.

The appointment of officers and committees for the ensuing year was considered, and the following nominations were approved for submission at the annual meeting:—President, Coun. W. G. England, J.P., Barnsley; senior vice-president, Mr. A. J. Forsdike, Sheffield; junior vice-president, Mr. J. Townsley, Hull; treasurer, Mr. W. T. Ledgard, Leeds; administrative committee, Coun. W. G. England, J.P., Barnsley. Finance and Emergency Committee:— President, two Vice-Presidents, Treasurer, Councillor Mallinson, Messrs. A. Moulson, W. R. Thompson, and W. E. Biscomb. National Federation and Northern Centre (5):—President, Messrs. A. J. Forsdike, W. T. Ledgard, W. R. Thompson and A. W. Sinclair, with Mr. P. Rhodes as reserve in the event of a vacancy arising. National Conciliation Board (3):—President, and Messrs. A. J. Forsdike and A. W. Sinclair. Northern Centre Conciliation Board (4):—President, and Messrs. A. J. Forsdike, W. R. Thompson, and R. Finch.

Further nominations may be made, but must, in accordance with the resolution of the Council, reach the Federation Secretary not later than December 2nd.

On the motion of Councillor G. Haigh, seconded by Mr. J. Biggin, the arrangements for the annual dinner were referred to the officers of the Federation, with power to add to their number.

On the motion of Mr. E. Quibell, seconded by Mr. R. Finch, the local associations were recommended to take into consideration the expediency of keeping a register of accidents for reference of members when engaging workmen.

Mr. J. H. Tomlinson invited the Federation to hold the annual meeting in Leeds, and it was resolved to accept the invitation, and to hold the meeting on Thursday, December 16th.

The Council were afterwards entertained to tea by the President and members of the Wakefield Association, to whom a hearty vote of thanks was accorded for their generous hospitality.—J. DAVIDSON, Secretary.

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted, although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

J. G. HAMMOND & CO., LTD.
PRINTING CONTRACTORS.
LONDON WORKS: 32 to 36, Fleet Lane, Ludgate Circus, E.C.
MIDLAND WORKS: Scotland Passage, High Street, and Moor Street, Birmingham.

SPECIALITY:
CATALOGUES of all Kinds,
PUBLICATIONS of all Kinds,
BOOKS of all Kinds.

LARGE INSTALLATION OF LINOTYPE AND MONOTYPE COMPOSING MACHINERY. ENGLISH, AMERICAN AND FAST ROTARY PRINTING AND FOLDING MACHINERY.

IMITATION TYPEWRITTEN CIRCULARS supplied with names and addresses typed in separately to match the body or alternatively so printed as to enable you to type in the names and addresses on your own typewriter.

SEND FOR ESTIMATES AND UNIQUE TESTIMONIALS.

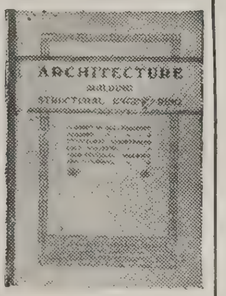
Employers are too busy to play the part of teacher

It was only in the old handicraft days that an apprentice could learn at his work all that was necessary for a progressive future. To-day, you must secure sound technical training if you are to rise above routine.

The International Correspondence Schools exist for the one purpose of supplying this training. The I.C.S. courses are followed at home by correspondence. They include everything that is necessary for financial advancement—and nothing else. Thus you can study just when convenient, and you are always on serviceable lines. Moreover the "I.C.S. Students' Aid Department" renders free service in the matter of employment. Student A. W. Scott, of Fenton (Staffs.) writes :

"When I took up your Electrical Engineering Course, I was working a dip engine on a colliery. Although working long hours I managed to study about an hour a day, and persevered so well that I decided to place my application with your Students' Aid Department. The result, as you know, was very gratifying. *In a few weeks you found me the position which I now fill, at a salary 20% greater than my wages were at the time of commencing studies.* I could not possibly have qualified for this position had it not been for your tuition."

Send us a postcard, mentioning your line of work, and we will forward you details of the appropriate I.C.S. Course, together with a list of the Faculty Officers and Experts whose brains and experience we place at your disposal. Write NOW. 213



PARTIAL LIST OF I.C.S. COURSES
(There are over 120 in all).

The Renowned
Andrews-Hawksley
Patent Tread

Applied to Wood, Iron, Stone or Concrete Stairways, Floors, Landings, Platforms, Non-Conducting Floor Plates for Electric Light and Power Stations, Pavement Covers, etc., etc.

Pioneers of all Stair Treads.
The Tread that has lasted a lifetime.
There is nothing to equal it in the Market.

Architects and Engineers are invited to inspect our New Iron Staircase and Stair Tread made and laid by us at St. James's Park Station (District Railway).

Quotations given for Concrete Steps fitted complete with our Treads.

REGISTERED TRADE MARK.

Quotations given for Concrete Steps fitted complete with our Treads.

Used by Great Western Railway, London and North Western Railway, London Brighton and South Coast Railway, Great Northern Railway, Midland Railway, North Eastern Railway, North British Railway, Lancashire and Yorkshire Railway, H.M. Office of Works, War Office, Admiralty, etc.

Specialists in Light Constructional Work in Iron or Steel; Special Work in Wrought or Cast Iron; Staircases of every description; Concrete and Granolithic Work, etc.

Fire Escape Staircases with our Treads, a Speciality.

The Cinderella of the Arts.

A Scottish architect, in the course of an address entitled "The Critical Study of Architecture," delivered before the Royal Philosophical Society of Glasgow, revived the old complaint that "while the merits or defects of the drama, music, books, and pictures, are discussed and criticised in the newspapers, architecture receives no such recognition." It is seldom, he adds, truly enough, that an intelligent criticism of a modern building appears in the daily Press; and he thinks that, since the Press may be trusted to know what the public wants, the reason why the mother of all the arts is thus neglected is because the public feel no curiosity about architecture. The lecturer—he was Mr. Alexander Cullen, F.R.I.B.A., F.R.S.E.—went a step further, and declared that a certain measure of responsibility for this apathy rests with the architect, whose work fails to interest the public. Mr. Cullen's data are indisputable, but his inferences do not command our instant assent. For while it may be granted that architecture would do better if the public were less ignorant and apathetic, it may be doubted whether the architect has much power to compel their admiration of good work while they still love darkness rather than light. He can, and does, do much to elevate the public taste; but the conversion is very gradual, and depends very largely upon other means than those the architect controls. Then it occurs to us that, given a public fancying that it knew a great deal about architecture, the architect's last state would be worse than his first. Already the worst sort of client is the one who imbibes fads and freak notions from organs of the lay Press which dabble in architecture; and the great bulk of the alleged criticism of the drama, music, and pictures, that appears in the daily Press, does not encourage us to yearn for similar treatment of architecture. The conversion for which the architect should pray is almost purely spiritual. If "knowledge comes, but wisdom lingers," Crotchet Castle will be a fashionable model; but if our public will add to the many ideas borrowed from America that of placing implicit confidence in the knowledge and skill of the architect, the art will be emancipated from the thraldom by which at present it is debased and dejected. It seems to us, therefore, that the crux of the problem is not: How shall we educate the public? but: How shall we inspire them with the right spirit? By what means shall we win their trust and confidence? Education of a kind is doubtless one means towards a solution of the difficulty; but it is the education of the architect, rather than that of his client, that is our chief concern. When it is known and seen of all men that he is being trained upon right methods, and when, by reason of his status and influence, he is able to impress the public mind with a due sense of his importance to the community, then architecture will be in a fair way to come by its own. The Cinderella of the Arts will be recognised as a Princess as soon as she is fitted with the little glass slipper which the R.I.B.A. is understood to be preparing for her. We by no means despair of that happy consummation, and we must confess that our optimism was greatly encouraged by Mr. Ernest George's forecast, in his Presidential address, of a more liberal scheme of study, and of a closer approach to the educational ideals that have been so much more abundantly realised on the Continent and in America. The men we have; the method is still to seek.

The Town Planning Advisory Committee.

The Housing and Town Planning Bill having survived the strife of parties, the National Housing and Town Planning Council is setting to work in earnest to obtain skilled advice as to the practical application of the Bill's provisions. The Council has convened a conference on the subject to take place at the Westminster Palace Hotel on Tuesday and Wednesday, Dec. 14th and 15th, when a series of suggestions as to most practical lines of town planning procedure adapted to (a) great centres of population; (b) urban districts will be submitted as a basis for discussion. It is proposed to form a Town Planning Advisory Committee, on which nearly a score of gentlemen distinguished for expert knowledge of various phases of town planning have been specially invited to co-operate. The names include half-a-dozen Germans, and only one Frenchman—M. Augustin Rey, of Paris; and the British half-dozen or so architects invited are Professor S. D Adshead, Mr. E. M. Gibbs (Sheffield), Mr. Percy B. Houfton, Mr. Raymond Unwin, and Mr. Percy Scott Worthington—a list that might with advantage be considerably extended, as perhaps it will be when the committee is actually formed. That Germany is so largely represented is a tacit acknowledgment of the pre-eminence of that country in town planning, and there is no doubt that the practical experience of these gentlemen, if they can be induced to impart it, will be materially helpful in the necessary process of roughing out an initial policy. The Bill itself owes much to the example of Germany; and in studying how to apply its principles it would be the height of folly to ignore what has been done in that country. There is but little danger that we shall be mere copyists of these convenient German models, which will teach us what is for avoidance as well as what can be advantageously imitated or adapted to our own national needs and circumstances. It is, of course, with regard to town planning, rather than to housing, that we must look to Germany for instruction. If in German housing schemes there is found to be any superior feature, we shall at least have the consolation of knowing that it was from England that Germany got her first inspiration in this kind. Indeed, the Germans, although they may have improved considerably on our block buildings, have observed that that system is no longer in favour in this country, and are rather envious of our more recent forms of industrial dwellings This kind of international exchange is obviously beneficial all round, and therefore the mildly cosmopolitan character of the proposed Advisory Committee is one of the many hopeful signs that we are shaking off the shackles of insular prejudice.

Right Restoration (?)

The "right principles of church restoration" have been voluminously discussed by all sorts and conditions of men—nor is the cry of "votes for women" here callously disregarded—in the pages of the "Church Family Newspaper." Mr. A. C. Benson started the discussion with an exceedingly interesting article on the quaint old church of Cartmel Fell; and several architects of note have joined in it, including Mr. W. D. Caröe and Mr. P. Morley Horder. The former raises a point that has been considerably canvassed of late in another connection: "No ancient building," he writes, "should fall into hands which have not the tenderest regard even for what is ugly, as ugliness is classed at the moment when it is dealt with; and above all, it should not fall into hands of builders, no matter by what architect directed, who have no experience other than that of modern methods of building." In other words, there is no absolute standard of beauty. What was once esteemed is now despised and may be again deemed delightful. It is almost exactly what Mr. Balfour said in his Romanes lecture at Oxford; but Mr.

Caröe got in some time before him with the not very recondite observation. The moral of this changing view of æsthetic values must be very gratifying to the Society for the Preservation of Ancient Buildings, for it amounts to this—that you should destroy nothing that is old, no matter how ugly you may think it, since your judgment may be prejudiced by the convention of the moment!—a very comfortable doctrine for the old-work enthusiast; for it reduces the wicked "destroyer" to absolute helplessness. It renders the whole problem absurdly simple; and yet it is a greater mystery than that which made the ugly duckling a potential swan. The change in the duckling was observable and explicable; the difference between our own vision and that of our forefathers is inscrutable. Mr. Caröe's proposition, however, is strictly true, providing it is not pushed to extremes. There can be no doubt that much beautiful work has been destroyed, not out of wantonness, but from ignorance of the waywardness or mutability of taste, and recognition of the fact should render us more cautious in dealing with "excrescences" and the like. At the same time, it cannot be denied that veneration for what is merely old can be easily overdone, and is often carried to absurd extremes, the very "vesture of decay" being regarded with fatuous ecstasy. It is between these extremes that sublimated common sense gets in its worthy work, with hearty abuse from both sides as its reward. That is about all the light that we have been able to derive from a rather futile discussion of a subject in which general agreement is utterly hopeless, since the factors in the problem are elusive and indefinable.

An Abortive Competition.

The Derby Education Committee seems not to have taken sufficiently to heart the wisdom of the Socratic question beginning, "Thou that teachest another—." The terms of its advertisement inviting designs for a new school did not secure the approval of the R.I.B.A., nor of the local society of architects. A resolution on the subject was consequently rescinded by the committee, who, however, declined to accede to the request that an assessor should be appointed. The committee thought that such an appointment "would have precluded them from having the deciding voice in the selection of plans." Consequently, they seem to have abandoned the competition, as they have empowered a sub-committee to appoint an architect to prepare the designs. We can only cherish the hope, while we cannot entirely banish a suspicion to the contrary, that this decision was not dictated by pique, as though the thought were: "If we cannot do it our way, we will not do it your way, but will choose an independent method." It is to be supposed that even Education Committees are not completely immune from such little ebullitions of temper; which fact, we trust, is always duly taken into account when such bodies are approached officially with respect to their adventures in building. The Committee's objection to appoint an assessor is perhaps understandable on somewhat similar grounds. An education committee may be easily imagined to possess rather more than the normal allowance of intellectual independence, and may perhaps be excused a slight excess of authoritative assumption. In such a case, it is quite possible to condone such failings, because they may be charitably supposed to "lean to virtue's side." True, there is that disturbing thought, "Thou that teachest another, teachest thou not thyself?" The Committee might, perhaps, have been a little more amenable to professional advice. But a strong committee does not easily brook dictation, and that is a feature of the competition system which is not always sufficiently taken into account. We do not see, however, that the Committee's objection was insuperable. Granted that if a competent assessor is appointed, it is wise to accept his decision; yet authorities have been known to act as moderators on the verdict. Probably in doing so they take a certain amount of legal risk; for if they override the assessor they can no longer shelter themselves behind him; yet if we read this case aright, this particular committee was prepared to incur the equally imminent liability attendant on dispensing with an assessor, which, in the present state of the law, is surely an unwise course to pursue. We are, of course, sorry that the architects did not, in the instance under notice, succeed in carrying their point. At the same time, we cannot help thinking that some *via media* more gratifying to the profession than that chosen by the Committee might have been possible if the etiquette of competitions had been a little less rigid. We cannot overlook the fact that an education committee, inviting designs for a school, may be reasonably credited with more than ordinary knowledge of its own requirements, and might therefore be expected to demand a voice in the decision. We are not aware that this opportunity was requested or denied. Again, it sometimes happens that, in arranging a competition for a hospital or an infirmary, a medical expert is conjoined with an architect in the assessorship. A similar course might be possible—but we are afraid that it would not be welcome to the architect—in the case of a school, the joint assessor in that case being an educationist. We are suggesting this merely as a *modus vivendi*, and by no means advocating it; because we seem to remember that there have been cases in which such an arrangement has worked very badly. In itself the case is of no great importance; but, as we have shown, it raises an interesting point with regard to the conduct of competitions. The whole system seems to be ripe for reconsideration by the R.I.B.A. As matters at present stand, it is a prolific cause of annoyance to clients as well as to architects; and in this instance both seem to have been hit.

Mansion House Apprenticeship Conference.

The Mansion House Conference on the apprenticeship problem, held last week, was in many respects disappointing, and builders have not much to hope from it. There was an enormous amount of talk, but no resolution was taken, and the speakers left the question pretty much where they found it. Mr. Cyril Cobb, vice-chairman of the Education Committee of the London County Council, who opened the discussion, suggested that one of the first essential movements towards reform was the raising of the school age. Another was "compulsory time off"—which means, we presume, that employers are to afford their apprentices opportunities of attending technical schools. Sir Thomas Wrightson was more definite and practical than any of the numerous other speakers, as he described a system which has been successfully adopted in a large engineering establishment in the North. In the works with which he was connected, they had placed as teacher over the boys the junior foreman in each department, the idea being that the junior foreman being the man who superintended the work of the boys during the day, would, through the knowledge he had of the character and capacity of each boy, be the best man to teach them in the evening the theory of the various operations of the day. It is to be hoped that the working day is short, otherwise the boys, being sick of the practice, might not be very keen to study the theory. Sir Thomas, however, was able to assure his hearers that under this system his firm was turning out some most promising young workmen. The system, however admirable in its results, does not strike us as being capable of general application; for instance, it could hardly be adopted in the building trade; which brings us to the observation that at this meeting the largest of the great industries seems to have been unrepresented—why, we cannot conceive. A comparatively small section of the working community—the printers—were very ably represented by Mr. Walter Hazell; but if any representative of the kingdom's largest synthetic industry voiced its views, his utterances were not chronicled in any report of the meeting that we have seen. Mr. Hazell went straight to the heart of the matter. He observed that business hours are now too long to admit of youths successfully following a system of technical education carried on after business hours. What was wanted was a system of day training schools. He seems not to have mentioned at this meeting a fact of which he is very well aware—that printers have long allowed what Mr. Cobb had called "time off" to apprentices, in order that they might attend afternoon classes at the St. Bride Foundation Institute, London, E.C., the Borough Polytechnic, and elsewhere. Nor did he mention the almost equally interesting fact that it is still the general custom among printers to bind boys for the perhaps excessive term of "seven long years," as the apprentice sings in "Sally in our Alley." Those builders who are interested in the question of apprenticeship, and in the education of the apprentice might obtain much useful information on the subject from the St Bride Institute, and much valuable advice from Mr. Walter Hazell himself, who has long been an active worker in the cause of technical education. Seeing that he was invited to the meeting, and that he spoke so much to the purpose, it cannot be said with justice that the conference was altogether barren and sterile, or that the wrong people were invited. But we must confess our disappointment at its lame and impotent conclusion. We take some comfort in the thought, however, that a Mansion House meeting is usually more fruitful in suggestion and in influence than in actual accomplishment; and it may have justified itself by the widespread attention to the subject that has been attracted by the reports of its proceedings. Perhaps, in the circumstances, a purely academic discussion was all that was possible, or even desirable. The matter is assuming too much importance, and is of too large a complexity, to be settled out of hand at a meeting representing (however inadequately) so many and such varied interests. The ground of our disappointment is that it has done so little to establish useful general principles.

BUILDERS' BENEVOLENT INSTITUTION DINNER.

The sixty-second annual dinner of the Builders' Benevolent Institution was held in the Whitehall Rooms, Hotel Metropole, London on Thursday, the 2nd inst. Mr. Howell J. Williams, J.P., L.C.C., President B.B.I., occupied the chair, and among the guests were noticed Sir R. Melvill Beachcroft (chairman L.C.C.), E. Smith, J.P., G. A. Hardy, M.P., T. Davies, M.P., W. Higgs (P.P.B.B.I.), E. B. Ellis, F.R.I.B.A., W. Lawe, jun., J. W. Lorden (P.P.B.B.I.), G. Crickmay, F.R.I.B.A), B. I. Greenwood (P.P.B.B.I.), J. H.Colls (treas. and P.P.B.B.I.), J. S. Gibson, F.R.I.B.A., J. Carmichael, J.P. (P.P.B.B.I.), J. Randall (P.P.B.B.I.), F. G. Rice (president L.M.B.A.), G. Bird Godson, W. Collins, J. F. Parker, J. W. Chessum (P.P.B.B.I.), H. A. Bartlett, G. M. Nicholson, F.S.I., J. Sabey, H.T.A. Chidgey, and T. Costigan (secretary B.B.I.). The toasts, "His Majesty the King," "Her Majesty Queen Alexandra, Their Royal Highnesses the Prince and Princess of Wales, and the other members of the Royal Family," having been proposed by the President, and loyally honoured by the company,

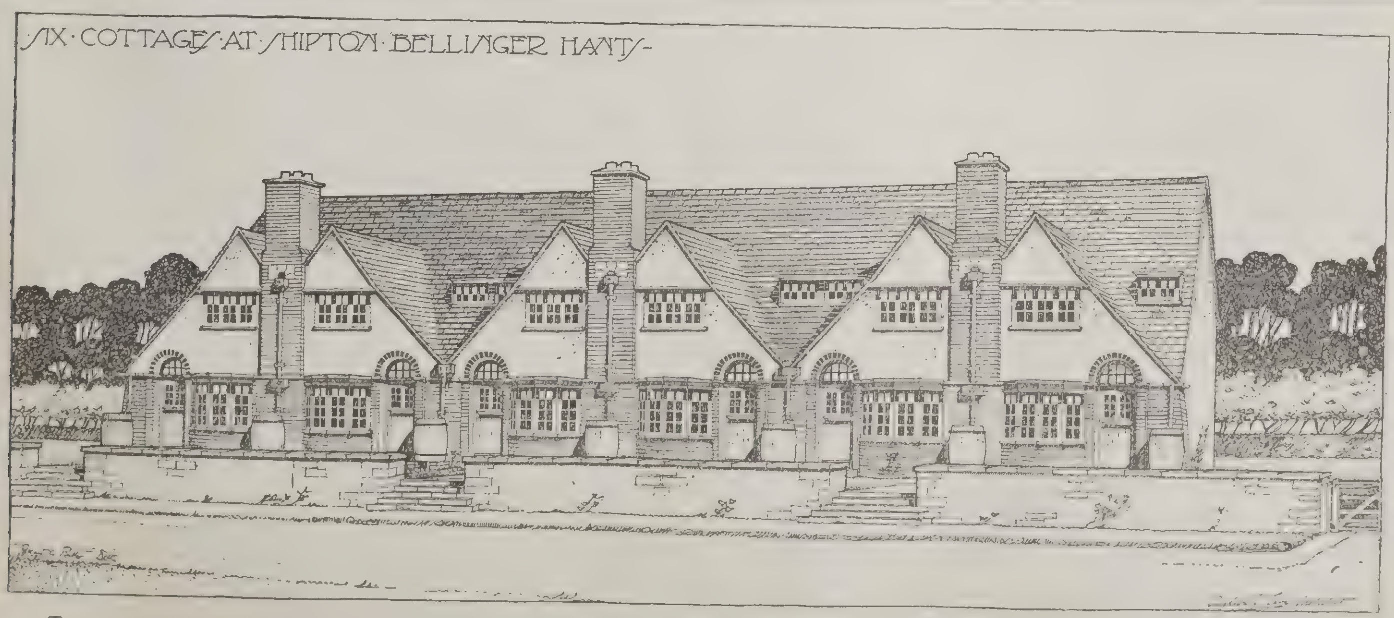
Mr. J. Howell Williams, in proposing the toast, "The Builders' Benevolent Institution," observed that it was a particular pleasure to get out of the party arena and to meet men for a benevolent purpose. He felt with some remorse that he ought to have occupied his present position some years ago, but public life had compelled him to shirk the duty. Realising that this was the sixty-second annual dinner, and seeing the magnificent giants who had gone before, he could not but be conscious of his inadequate occupancy of the office. It was a nasty thing to beg, but that was his mission. One of his municipal duties was to visit the L.C.C. schools; and he always impressed upon the children the motto, "I come to school for a purpose." His object in mentioning this was to emphasize the fact that he was there for a purpose—the augmentation of the funds of the society. He would not breathe the cause, but there was a most serious depression in the building trade. The immediate effect of this was that the number of pensioners had increased, and the funds naturally had decreased; so much so that they had had to draw on the reserve, and, therefore, it was his duty to make an extra appeal. He was reminded at this juncture of the story about the mistress who, hearing a mysterious noise in the locality of the kitchen, went downstairs to investigate. Everything was in order and the servant knew nothing of the disturbance. Hearing a suspicious sound in the cupboard, the mistress opened the door and discovered a full-blown soldier. "Oh," said the maid, "I know nothing about it. It must have been left there by the last servant." It was the same with himself. He applied the moral of the tale to his own case, and refused to accept responsibility for what had been left behind by the last president. In spite of the great trade depression, some of them had earned increment—he would not say "unearned." Times had certainly changed, and the change had brought the quantity surveyor. If they could only get quantity surveyors of the right sort, they were not so likely to be ruined. He pleaded for a generous answer to his appeal. Who knew but what times of adversity would overtake even the best endowed? He asked them to do their very best, and coupled with the toast the name of J. Howard Colls.

Mr. J. Howard Colls, rising to respond to the toast, observed that they owed a special debt of gratitude to Mr. Howell Williams for presiding on that occasion, and entering upon so thankless a task. While both masters and men were suffering from the same cause, it was essential to their existence that they should help each other. They all knew that the number of men in their own trade suffering from lack of employment amounted to something between 30 and 40 per cent. Small wonder that the Institution solicited the earnest support of those who were able to give it. The president had, with a modesty that did not always distinguish his countrymen, entirely obliterated his own name from the toast list. There was no toast, "The President." Nevertheless, he would ask them to drink his very good health.

Mr. Howell Williams, responding to the toast, said he would express himself in the old Welsh saying, "Thank you for thanks." Turning to the question of modern innovations, Mr. Williams referred to the progress of "steel construction" and "reinforced concrete; and he spoke also of the exorbitant requirements of Councils and clients generally. For instance, he proceeded, they would read that a new hall was to be built (several voices, simultaneously: "Where"?). All the old material was to be incorporated in the new building, and the old hall was not to be disturbed until the new one was erected. This was an example, somewhat exaggerated perhaps, of the sort of thing the builder had to contend with.

Mr. J. Carmichael, J.P., in proposing the toast, "The Architects and Surveyors," observed that he had reached the stage when he might honestly claim to be acquitted of the excitement of after-dinner speaking. That duty should devolve upon young men, and not upon one who was sunning himself in the afternoon of his commercial career. Never before, he believed, in the history of building, had the art reached so high a level of accuracy and efficiency; and, in that state, it was never more difficult in the execution than it was to-day. It was said that quantity surveyors made mistakes. They never did—or if they did, they never owned to them. The work in all its branches was subjected to very rapid movement; and the average architect in London had to be a veritable walking encyclopædia. Sketch plans were usually required within a week—the completed plans within a month. The quantities were then taken very rapidly off, and the builder was given three days to price them. The result was naturally something not worth having. He was reminded of a story he heard recently at a political meeting. An Irishman succeeded in selling a horse to a customer, who, from the very eulogistic account that was given of it, became somewhat suspicious, and said to the Irishman, "Now, Pat, what's really the matter with the horse?" "Well," said the Irishman, "two things. First, if you turn him into a field you'll have great difficulty in catching him. Second, when you've caught him he's not the least bit of good." Continuing, Mr. Carmichael said the language was not his but the Irishman's. It was just the same with buildings. When you got them they were not a bit of good.

Mr. G. Crickmay, F.R.I.B.A., who rose to respond for the architects, observed that architects as a body greatly sympathised with the builders. Their interests, although not identical, had much in common. When architecture was bad, building was necessarily bad also. The Benevolent Institution was one specially worthy of support in every possible way. It was always a pleasure for him to meet builders, for whom he felt great admiration and respect. He was gratified to hear recently from a gentleman who travelled extensively round the country, that nothing was so pleasing and delightful as the English gentleman's house. In this respect, at least, the English architect excelled his foreign brethren. During the last ten years he had been struck by the great improvements that had been effected in London. As people became more and more interested in good architecture and good building, so the demand for improvement was stimulated. The trend of public taste was to be observed in town planning, and the garden cities, which had the effect of making people think.



These cottages, of which the plan is shown on the next page, have brick walls for the lower part, with roughcast above, and stone-tiled roofs

AYLWIN O. CAVE, ARCHITECT.

Mr. G. M. Nicholson responded to the toast for the surveyors, and referred to Mr. Carmichael's statement that surveyors were inaccurate. He would remind them that there were also mistakes that builders made, and would not acknowledge. Surveyors were certainly in a most difficult position. Mr. Howell Williams had said that they wanted the right sort of surveyor. The "right sort" depended largely upon the point of view. Perhaps the description would suit the surveyor who, when some slight alteration was required to be made, would declare that the whole cost of the room would thereby be increased 25 per cent. Mr. Nicholson then proceeded humorously to enumerate several of the builders' vulnerable points and their minor delinquencies. The boom at the end of the last century, he continued, had the inevitable reaction, and the many building firms that had sprung into existence had since had cause to regret it. Within the last seven years they had two big wars which had resulted naturally in raising the price of money. Concluding, he thought that building land should be placed upon the same basis as agricultural land.
